### AUDIO SELECTIVITY

Position #1 Normal. Position #2 Communications. Position #3 high selectivity with broad and sharp (#4), variable control of a sharp toroid filter centered around 1200 cycles. As much as 850 cycle separation has been achieved with complete ease with this newest of receiving features.

MASTER OSCILLATOR  
AND FREQUENCY METER

### MODEL PMO

An even controlled high stability portable master oscillator - readable and resettable to better than 20 parts/million. The PMO is being used as frequency meter and transmitter exciters, 2 to 8 mc. Direct reading in cycles on basic range 2 to 4 mc. Write for bulletin 173A.

FREQUENCY SHIFT EXCITER

### MODEL XFK

Highly stable—Shift Variable from 0 to 1000 cycles. All controls calibrated in frequency. Keying speed 1000 WPM - 1.0 to 6.9 mc in 2 bands. Write for bulletin 118.

Your emblem of quality, craftsmanship, and guarantee of performance. Look for it at your favorite dealer or write . . .

# THE TECHNICAL MATERIEL CORPORATION

MAMARONECK, NEW YORK.

OTTAWA, ONT., CANADA

(Continued from page 80)

June. The Columbus *Carascope* relates that EA is on 40-meter c.w. with 25 watts; HUE has a new 50-foot tower; ZCK has a new 20-meter antenna; and DWG is a senior in physics at Ohio State. Toledo's *Shall Gossip* lets it be known that HCN and QCT are now mobile; VPZ has a new jr. operator; WMO and WTW are new Toledo Novices; and the Toledo U. Radio Club has a home-built 500-watt transmitter on the air. Eastern Ohio's *Ham Flashes* reports that KYL, of Cortland, is the first RTTY station active in the area; NXK was elected president of the Salem Lions Club; 0MPQ has moved to Youngstown; TDD, of Alliance, passed his General Class exam.; DXO has changed QTH; and new Novices in Warren are WHV, WAF, and WRP. FRY, editor of *Ham Flashes*, recently had a paralytic attack. Speedy recovery. Don! Traffic: WSNVJ 288, HR 236, ARO 180, UPB 174, DAE 153, RO 112, AL 61, HNP 59, FJV 51, HPP 41, AJW 39, AMH 36, JHH 30, IUX 28, QXH 25, EQN 24, IJH 24, ZAU 23, LYD 14, OPX 12, AJH 11, PBX 11, CZ 10, LMB 10, TLW 10, HFE 9, NZC 9, KDY 8, RN 8, PJ 7, APC 6, AQ 6, ET 6, MGC 6, LGR 5, VUS 5, BLS 4, DG 4, IAY 4, KIH 4, WYL 4, THJ 3. (Apr.) WSNZC 7.

## HUDSON DIVISION

**EASTERN NEW YORK** — SCM, Stephen J. Neason, W2ILI — SEC: RTE. RMs: K2BJS and TYC. PAMs: GDD and IJG. The Ladies' Auxiliary of the AARA is to be congratulated on a job well done in sponsoring a recent dinner party held at the Shadow Box near Albany. The affair was well attended and many guests, including your SCM, were present. The Club soon will celebrate its 45th anniversary. Congrats to K2BJS, who earned a BPL medallion plus a Public Service Award. The HHRL will stop publication of *Zerobeat* for the summer. K2EUF will attend R.P.I. in the fall. Congrats to TEP, manager of NYSEPN, and those responsible for the publication of *Zerobeat*, the new net bulletin. Look for this net on 3920 kc. Mon. through Sun. at 1800. From all indications and reports, our Eastern New York clubs have enjoyed a very successful season. The coming season looks even more promising, since many are planning more activity and social events. Yes, there is a club located near your home. A card or message to the SCM will bring information. K2CQS finally has gotten his s.s.b. signal on the air. AWQ is getting out FB on 144 Mc.; the rig is a Gonset. K2HXR dropped the "N." Our best wishes for a safe and enjoyable trip go to our busy SEC, RTE. Ted will visit France and Germany while on a trip lasting several weeks. All AREC matters will be handled by Assistant SEC LEL during Ted's absence. The Eastern New York Council of Radio Clubs extends a cordial invitation to ALL of the Eastern New York clubs to take part in our council activities. For full information, please contact EFU, secy. TYC still is on 7 Mc. but claims conditions unfit for QTC work. Don't forget your endorsement date. Traffic: K2BJS 82, EHI 76, EDH 31, BE 22, EKE 17, W2EFU 15.

**NEW YORK CITY AND LONG ISLAND** — SCM, Carleton L. Coleman, W2YBT — Asst. SCM: Harry J. Dannels, 2TUK. SEC: ADO. PAM: NJL. RMs: VNJ and LPJ. ZAI has found it necessary to resign as SEC and ADO has taken over this important post. Thanks to Jim for his fine work and let's all cooperate with Mike in his new position as SEC. All ECs report to M. Mulligan, W2ADO, Box 134, Westbury. VNJ reports that the NLI Net is now on summer schedule (Mon., Wed., and Fri., 3630 kc. at 1930 EDT.) KGN resigned as EC for Brooklyn and K2CRH took over. HDV has taken over as Radio Officer for Brooklyn. K2GMC is EC for Manhattan and OQI is EC for Brookhaven. K2HYK had his best traffic total to date. New appointments: WFL as ORS K2s EQH and IDO as OBSS. All ORSS, OPSS, and stations handling traffic are urged to report traffic totals regularly. KN2LGR is on 80 meters with 807 and ARC-5 receiver. ELK installed 2-meter mobile rig in his new car after a battle with 12-volt conversion. The Eastern Suffolk RC now has over 50 members and is still growing. New officers of the NYU RC are K2EOF, pres.; GHH, vice-pres.; KN2JHM (M), secy.-treas.; and FSO, trustee. The Order of Boiled Owls RC placed 9th in the country in the SS Contest and 2nd on a points-per-man basis. K2AMP is building an electronic keyer. AEF discontinued major station activities for the summer. VDT built a secondary frequency standard. PF would like to see an s.s.b. traffic net. Anyone else interested? IN has a new 30-foot telescopic mast for 2-meter antennas at Brewster QTH. We regret to report that CZV has joined Silent Keys. LGK's jr. operator is now KN2OFO. K2KXZ dropped the "N." Ditto for K2IAD, who plans to use a BW5100 with his HQ-140X. K2HSZ is going on 2 meters. K2KNA has a new Vizing Adventurer. The NYU RC station, DSC, has a new BW5100. New officers at Columbia U. RC are KN2IKI, pres.; OLA, vice-pres.; KN2LQN, secy.; K2IDUY, treas.; DAL, tech. dir.; and K2CUI, comm. mgr. K2AUM started a 50-Mc. mobile rig. K2BAH has a new beam for 144 Mc. New officers of the NYRC are CMM, pres.; UWG, vice-pres.; ATT, secy.; and OGX, treas. YBT is back on the air with 100 watts. New officers of the Fordham RC are K2CWQ, pres.; PRR, vice-pres.; IGS, treas.; HVC, corr. secy.; and K2CCN, rec. secy. Club directors are IVG, IN, ZYC, IGS, and K2s BRK and CQY. The Club now boasts

of more than 100 members. K2HII soon will be in W6-Land. BTA is on 220 Mc. with a QST-brewed rig using 6360 final. DLO has crystal converters for 6, 2, and 1 $\frac{1}{4}$  meters. K2IDO expects to start handling traffic soon. K2CQP/2 can be heard from summer camp at Andes, N. Y. New officers of the Nassau RC are MDM, pres.; VL, vice-pres.; K2GQA, secy.; K2HEA, treas.; and PC, GLU, and K2BMD, trustees. ONG keeps skeds with his son, HUW, in Plattsburg, N. Y. Keep the reports coming during the summer! Your reports are needed prior to the fifth of each month in order to meet the schedule. Traffic: (May) W2VNJ 256, K2HYK 207, W2OME 108, K2ABW 87, W2GXC 75, MUM 72, WFL 68, K2AMP 67, W2AEE 60, VDT 33, PF 23, K2CRH 20, W2IN 19, LGK 18, OBU 17, K2HID 15, W2TUK 13, K2KXZ 6, W2MDM 5, EC 3, IVS 3. (Apr.) W2AEE 426, JGV 95, K2HID 45.

**NORTHERN NEW JERSEY** — SCM, Lloyd H. Manamon, W2VQR — SEC: IIN. PAM: CCS. RMs: NKD, CGG, and EAS. DXD is off on a round-the-world business trip and will be away from the home QTH for about three months. K2BWQ has new Collins KWS-1 and 75A-4. K2EQD is back from a Naval Reserve cruise to Florida. Network activities in NJN are slowing down a bit because of summer activities. JKH is off the air until the fall season rolls around. K2HXP has built a new rig and would like to get in touch with W2HXP. If W2HXP could arrange a sked it would be appreciated. KN2KHZ is burning up the air these days. So far he has worked 31 states. K2CHI is active in RACES nets. CVW is QRT for a few weeks because of a moving job which has to be done. K2GAS received a G. E. certificate for participation in emergency traffic nets during the past hurricane season. K2IKS is going mobile. John has just been discharged from the Army and plans to attend school in Potsdam, N. Y., in the fall. NYI still is QRL work. K2IBC was on with nine half-hour code practice transmissions last month. The Windblowers V. H. F. Society has a new banner designed by ISK's XYL. KN2MPE is a new station in the Livingston Area. NIE is the new Civil Defense Comm. Officer for Interlaken. At this writing all hands are hard at work preparing for "Operation Alert 1955." From all indications RACES activities in the section will reach a new high during the period of the test. State Civil Defense authorities are counting very heavily on amateur radio to carry the bulk of traffic which will flow from the bombed-out areas where land lines have been destroyed. New Jersey State RACES networks have accepted the challenge and are ready to take over. Our thanks go to the County ROS who have made the program possible. A late news flash has brought the good news that the new amateur license plate bill has just passed both branches of the State Legislature and is before the Governor for signature. NUI has done a fine job in following this project to the bitter end. There have been many adversers along the road but he has stayed with it. He has appointed a new committee to meet with the Director of Motor Vehicles to pave the way for the Governor's signature to the bill. The new committee is composed of ZI, IIX, and your SCM. We hope by the time you read this column the bill will have been signed into law. The State Director of Civil Defense and Disaster Control has promised to lend a hand in putting the importance of this bill before the Governor. K2ICE has a new horizontal array on 144 Mc. NIE is mobile on 144 Mc. from his yacht, the *Jane K*. Traffic: W2EAS 216, K2GFX 75, BWQ 58, W2CCS 42, K2DSW 29, W2FPM 19, K2IKS 17, HLA 8, W2NIY 3, CFB 2, CJX 2.

## MIDWEST DIVISION

**IOWA** — SCM, William G. Davis, W6PP — Well, this is my swan song, fellows. It's been a great satisfaction to serve you these many years. Please give your full cooperation to your new SCM. He can't do his job without it. New WNs in Humboldt are ZPM and ABE. LJW reports the Davenport Club was in there on Field Day. CGY has a new NC-125 and is active on TLCN. DST is scraping the bottom of the barrel looking for DX. HMM has an active class. SCA finally made the 'phone net. He reports his lowest monthly score in 18 months was 1117. QVA reports that NWX (FOSAJ of Clipperton fame) gave a talk to the Clinton Club. BDR addressed the Waterloo Club. KVJ had to curtail his TLCN activity on account of his work. QVA converted his Ranger for grid-block keying and likes it very much. SCA fixed his new Ranger likewise. TLCN members at the Quad City Hamfest were BLH, FDL, HMM, LJW, PKT, and QVA. Two new hams in Burlington are Novice BKL and Technician ASX. SEF again is active on the net. Well, that's it, fellows. Thanks for all the notes. I shall miss the job but I'll never forget the experience and the fine bunch of fellows I've worked with. So long, and 73. Traffic: W6BDR 1530, SCA 1271, FZO 710, CZ 321, QVA 124, LJW 113, SQE 97, BLH 48, LGG 35, KVJ 33, NGS 18, PAN 14, PKT 13, SEF 9.

**KANSAS** — SCM, Earl N. Johnston, W0ICV — SEC: PAH. PAM: FNS. RM: KXL/NYI. The SCM's new address is 1100 Crest Drive, Topeka, Kansas. The Udall tornado disaster is top news this month. REP, of Mulvane, found out from Mulvane Police at 2350 May 25th that the town had been leveled. He fired up his fixed station with his XYL ZTH at the mike and took out for Udall in his mobile

(Continued on page 86)

# How to select a tube for single sideband

To realize the advantages of Single Sideband operation, there are two important points to keep in mind when selecting a final amplifier tube. First, since there is no continuously running carrier, high peak powers may be reached when a signal is put on the air. And second, because it is easier to produce an SSB signal at a low power level, it takes more than an ordinary tube to build this valuable low power signal from the modulator to high power in a single amplifier stage. Eimac tubes offer these extras. Their reserve supply of filament emission, lack of internal insulators and widely recognized ability to handle high peak power has been proved over the years. And high power gain is inherent in all Eimac multi-grid tubes. When planning or building an SSB rig, remember these two important points and consider the Big Six of Amateur Radio—Eimac 4-65A, 4-125A, 4-250A, 4-400A and 4X250B radial-beam power tetrodes and the 4E27A radial-beam power pentode.

## EIMAC BIG SIX RADIAL-BEAM POWER TUBES CLASS AB<sub>1</sub> LINEAR AMPLIFIER SERVICE

### Typical Two Tone Performance\*

	DC Plate Voltage	DC Screen Voltage	Peak Sig RF Grid Driving Voltage	Peak Sig Plate Power Input
4-65A	2000	450	100	160
4-125A	2500	555	100	300
4-250A	3000	600	110	630
4-400A	3500	750	135	980
4X250B	2000	350	50	500
4E27A	2500	600	110	325

\*Permitting safe adjustment and conservative operation.

You can be sure of Eimac quality by asking your distributor for Eimac—the mark of excellence in electron-power tubes for over 20 years.

For further information about Eimac tubes and applications write our Amateur Service Bureau.

**EITEL-McCULLOUGH, INC.**  
S A N B R U N O • C A L I F O R N I A  
The World's Largest Manufacturer of Transmitting Tubes

arriving at 0025 the 26th. ZTH called SIG on the land line and SIG and YMG took off for Udall. At 0045 BAH called in and at 0220 UCS arrived at Udall with his mobile. Then the portable rig was set up at 0600 under the call of ULR 0. Participating thus far were BIX, ULR, UCS, ZMY, MAR, BIX, CLK, IAL, and BVQ. At 0900 OZN took over the NCS and SOE the Wichita Red Cross station and emergency traffic was handled throughout the day! Hats off to those who did such a wonderful job. PAH, our SEC, reports that YUQ M and he used their mobiles to keep Manhattan posted on the tornado activity May 27th from 2130 to 0030. PAH was on Blumont Hill and YUQ at Police Hq. UAR, KPE 0, and NFX assisted. Christy's picnic and the CKRC picnic were well attended. Traffic: (May) W0BLI 472, N1Y 321, REP 269, MXG 210, OHJ 187, UAT 115, FNS 101, SQX 86, ABJ 60, WWR 59, RKO 55, EOT 37, FIDJ 32, NFX 31, SVE 27, BET 24, YFE 21, SAF 19, KAJ 18, ICV 15, LOW 12, UAU 12, IFR 11, CET 6, KSY 6, KXB 6, PAH 6, YVM 6, QGG 4, RXM 3, YJU 3, KN0ADV 2, (Apr.) W00LJ 382, KFS, 9, KN0AHW 3.

**MISSOURI** — SCM, James W. Hoover, W0GEP — SEC: VRF. PAM: BVL. RMs: OUD and QXO. OMGP has a new 750-watt final. VRF reported that RVG, the Kansas City Red Cross station, handled tornado traffic from Kansas and Oklahoma. The Northwest St. Louis Radio Club received a station call, K0AXU. An emergency drill was held in Kansas City on May 29th and was very successful. GAR's line noise let up during May, and his traffic total is back up. The Suburban Radio Club held its annual dinner-dance. The Club is 100 per cent ARRL again this year. VWZ is a new member of MON. QXO traveled 4500 miles on his vacation. YQJ visited OUD and DE in Joplin. SCV helped CPI raise his 75-meter antenna another ten feet. YHL has a new mobile. SPU has installed a 95-amp. generator in his car for mobile work. New officers of the Bandhoppers Radio Club are LTT, pres.; JNK, vice-pres.; ENN, secy-treas. MON will continue the morning and evening schedule for the summer. Traffic: (May) W0CPI 1313, GAR 548, GBJ 366, OMM 244, YTF 194, RTW 93, CKQ 92, SAK 77, YPQ 51, IIR 45, QXO 32, BVL 25, KIK 17, EBE 16, GEP 14, MRQ 9, IJO 8, VWZ 8, MFB 6, TCF 5, ECE 3, BUL 2, (Apr.) K0FCT 262, W0VPQ 47, KA 5, ECE 3J.

**NEBRASKA** — SCM, Floyd B. Campbell, W0CBH — Asst. SCM: Tom Boydston, W0YX. SEC: JDJ. The Union Pacific Amateur Radio Club has been organized at North Platte. NET is chairman, KWQ vice-chairman, CBH secretary. KN0AKW was incorrectly reported recently as having a Globe Scout. He is using a Heathkit AT-1 and an S-40-A. It should have been KN0AKV instead of KN0ARV. Two new calls at Scottsbluff are KN0BBC and KN0BBD. A new call at Mitchell is KN0BJT. RHL has been processed for overseas duty, with Greenland as the intended assignment. DQN is working very hard on the 2-meter rig. GDZ is mobile. WN0V KQ and WN0V KE are on 2 meters. A code and theory session is held on 2 meters every Tue. at 7:00 P.M. CST. A 30-minute discussion is held on theory. Code is sent tone-modulated and lasts almost an hour. The following are ECs: MTL, YQR, UFZ, COB, DQN, GDZ, RYG, LRK, and URC. We are very much in need of ECs in the eastern part of the State. LRK is working on something for more selectivity on mobile converter. A new call at Orchard is KN0AMY. COB and his XYL stopped in for a very nice chat and informed us that a TVI committee has been formed in Sidney. COB is the chairman. KQX and GDZ can be heard operating from Estes Park for the summer. The North Platte Club meets the 1st and 3rd Tue. at the Fire Station. Traffic: (May) W0ZJF 310, DDT 153, AEM 48, ORW 47, MAO 29, KVM 26, NIK 22, FRS 21, HTA 14, K0WBF 13, W0PUT 12, VGH 12, ERM 11, SEZ 9, PPT 8, FMW 7, LEF 7, BEA 5, QOU 5, UJI 5, BTG 4, CHH 4, DJU 4, DQN 4, KFY 4, ZNI 4, K0AFO 3, W0CBH 3, THX 3, DDP 2, KLB 2, NGZ 2, OCU 2, (Apr.) W0DQN 12.

## NEW ENGLAND DIVISION

**CONNECTICUT** — SCM, Milton E. Chaffee, W1EFW — SEC: LKF. PAM: LWV. RM: KYQ. MCN and CN 3640 (0645 and 1845), CPN 3580 (1830), CTN 3640 (Sun. 0900), and CEN 29,580 kc. Traffic for CN reached 192, averaging 7.3 messages and 9 stations per session. MCN traffic hit 97, with 3.89 and 7.08 as the same type averages. QNI leaders were CN, RGB, LIG, ZDX, and YNC; MCN: IBE, RGB, and RFJ. MCN discontinued the Sat. schedule because of lack of traffic and interest. We seem to have hit new '55 lows for traffic all around. New General Class licenses are reported by CLD and CKA in Bristol. ODW reports RACES activity from DUL plus his own DX, which totals 151 worked and 135 confirmed. The Redding Radio Club meets the 4th Tue. and seeks ARRL affiliation. Real response to your SCM's plea for EC nominations came from the Middlesex RA to cover that area. Meriden has added several Gonsets to the mobile c.d. fleet to divide the group between 10 and 2 meters. FYG reports the club was active on Field Day from West Peak. RGB reports for the TIJ gang, which holds regular c.d. drills and has the following active: YFG, QGV, IWY, ZVJ, QMB, EBO, LF, DIT, and IJD. The TIJ crew includes RGB, STT, WHR, and PIP. ZKK is racking up DX using a Viking II on 20 meters, the

same for ZTQ with less power. BVB is using 40 meters only these days. A new Stratford Novice is FPX. The Stratford Club meets Wed. and welcomes visitors. OO reports came in from GIX, BVB, and RFC. Traffic honors again go to YBII who gets 'em all on the 'phone nets. More news from the clubs would be especially appreciated so how about loading me with stuff, fellows? Passage of the license plate bill made a lot of the gang happy but we wonder what it will do for the police — one more combination for them to figure out. Anyway, don't try to get them before 1956 renewal time. Traffic: W1YBH 245, RGB 180, LIG 112, KYQ 102, CUB 84, AYC 76, AW 75, EFV 75, UED/1 52, YYM 49, ZDX 28, YNC 26, LV 25, KV 20, BDI 18, TIJ 16, HYF 11, DXI 6, BVB 5, GIX 5, GVJ 5.

**MAINE** — SCM, Allan D. Duntley, W1BPI/VYA — The Pine Tree Net meets 5 nights a week on 3596 kc. at 7 P.M. The Barn Yard Net meets Mon. through Sat. at 0800-0930 on 3960 kc. The Maine Phone Net meets Mon. through Sat. 1700-1800 on 3940 kc. The Teen Age Forest Net meets Sat. and Sun. 1000-1100 on 3900 kc. As this is my first report as SCM, I want to thank all who supported me. I will pledge myself to carry on the work of the fine gentlemen who have held the position before me. Your continued support of the League is solicited. EFR, of Portland, has been appointed RM. I am sure that under Earle the Pine Tree Net will continue to do its usual good work to serve the people of Maine. Congratulations to the UAQs on a new pink harmonic. WRZ is on the air with a new mobile rig. TWR is forsaking his YLs on 75 meters to work new and greener fields on 20 and 15 meters. NXX now has to share his rig with the XYL, who is WN1FNJ. Look for these new WNs: FKJ, Maynard Bray; his XYL, Shirley, FKK; FHG, Ed Tarbox. DEA is now in the Air Force and looking for contacts back home. Let's not forget Stevie's (BOK) Hamfest Aug. 14th at Dexter. DEG now is K4CYC and is keeping daily skeds with LHA. AZQ has changed jobs and is missed on the Barn Yard Net. YGO and YGP are heard operating portable 3 in Hartley, Md. Traffic: W1WTG 180, TVB 70, NXX 54, ZME 52, UDD 40, LKP 36, LYR 22, EFR 19, SDW 14, TGW 8, BAD 7, YVN 7, BDP 6, BBS 3, TKE 3.

**EASTERN MASSACHUSETTS** — SCM, Frank L. Baker, Jr., W1ALP — Appointments endorsed: JNV, MKW, LQQ, VHH, and BGW as OOs; ISU, Hlbrook, PJ Everett, SS Lincoln, LQQ Hamilton, VYI Topsheld, CLF Norfolk, HKG Malden, MFI Barnstable, TJW Falmouth as ECs; LQQ as OBS; LQQ and GDQ as OPSS; MEG as OES; WU as ORS. Sorry to have to announce the death of LET of Everett. PYZ, RCA, EHY, FCJ and LJJ are on 2 meters. EHJ is new in Lynn. Heard on 75 meters: GYZ, LBH, and LQ. SKIH visited hams in this section. FIR, Medway, and FNM, Quincy, are new Novices. REG is Radio Officer for Mass. Area 2 and AYN for 2B. MON moved to Derry, N. H. Area 1 Radio Comm. held a meeting with KTG, AR, CQ, DWY, ZYX, AWA, ALP, TQP, and QQL present. The Middlesex Radio Club code class has turned out the following new Novices: EZU, FAV, FQB, FGS, FTY, FIO, FIM, FIL (a YL), FJE, FJE, FMW, FOG, FOC, FOL, FRY, FFT, FFV, and ETB. JNV has 163 countries and is working on a new beam. Radio Amateur Open House held a meeting and TON spoke on the benefits of ARRL affiliation. CTR writes Division news for the National Union magazine, *The RR Telegrapher*. The South Shore Club had a talk by MME and an auction with AKY. YLV reports that the gang at the AFRC mostly 2 meters are PYT, QBT, JOJ, JBU, IRF, AFE, YLV, and RFB. ABJ has 20-meter two-element, cubical, quad and raised ground plane. BGW still is RTTY. EPE is NCS of 1RN on Tue. UKO has a new SX-96. IBE has a new antenna for 80 meters. DFY now has General Class. QLT has a Viking Adventurer. The T-9 Radio Club elected WNK, pres.; MVQ, vice-pres.; KON, secy.; CVM, treas. TJP is a new member. EK has a 500-watt power plant. VYS is on 6 meters. QMU is building a 10-meter converter. SXD is working on a crystal converter for 2 and 6 meters. PIW is trying stacked dipoles on 10 meters. HOL has a 6-meter Gonset. UH is on 20 meters with a new beam. LMU visited W8-Land. The Bedford Radio Club had an exhibit of amateur radio two-way communications at the annual Lions Club carnival. WKM has two Gonset 2-meter rigs. AEC has a new 10-meter ground plane, also one for 20, 40, and 80 meters; with a rhombic in mind on the 3½-acre club grounds. New Novices in New Bedford are FJI and FJQ. VRK had ½-kw. on all bands. JLN has a Viking Ranger and Maritime Mobile certificate No. 108. MTG is running kw. to grounded grid 304-TH. MGP is working the world on 15 meters with 25 watts. OGG has a new Telerec 20-meter beam and a coax ground plane. NLU has a new Viking KW. EQP and FAO are father-and-son Novices in Marblehead, also ELA and ELB. The North Shore Amateur Radio Assn. for C. D. has a new TBS for the club station. JEL has a new kw. bandswitching rig. CMM, JEL, TRE, MTG, and MGP met KZ5GD and KZ5DG at JLN's QTH. SHV is Radio Comm. Officer for Lynn C. D. AXA used a helium-filled balloon for a sky hook in the DX Contest. JLN is operating from his New Hampshire summer QTH as FOE. The Winthrop drill had 22 stations on with DLY, EAJ, DQF, BDU, CMW, DEL, DJ, OIR, DPN, DRP, DUV, IIFJ, MQB, NMX, TTH, BOX, UOC, VIS.

## "System Engineered" UNITS

One of the outstanding features of the new Bandmaster line is its adaptability to limited space. Each unit being only  $12\frac{3}{8}" \times 10\frac{1}{2}" \times 6\frac{3}{4}"$ , a complete station including antenna tuner, transmitter, power supply and receiver need never be more than 25" wide by 13" high.

For the small house owner or apartment dweller this is extremely important. Yet the T-90 packs 90 watts into less than one-half a cubic foot.

Send for detailed literature today.

# GENERAL PURPOSE POWER SUPPLY

This power supply is ideally suited for transmitters operated under **Novice** class licenses. When higher R.F. power is added later on, this supply may be used as a **modulator** power supply.

Symbol	Triad Type No.	List Price	Characteristics
T-1	P-5A	16.75	1100V CT Output: 400V DC @250Ma 5V @ 4A Fil.
L-1	C-31A	8.20	25/5 H @ 20/200Ma DC 150 ohms 1500V Test
L-2	C-14A	5.85	6H @ 200Ma DC 150 ohms 1500V Test

#### Additional components required as follows:

C-1 2 mfd 600V Oil filled      C-2 4 mfd 600V Oil filled  
If the above values are used, Ripple will not exceed 1.5%  
R-1 20,000 ohms, 25 watt wire wound      V-1 5R4GY or 5U4G

ZVO, TEO, QA, and BB reporting in. A new Novice in Winthrop is FHE, a YL. The following members of the Section 1-B Net were on in the monthly test: DUO, SH, FWS, GNK, IPE, YFA, DW, KWD, WUW, CLF, MGL, ISU, ALP, AJU, VTT, MME, WFQ, ZWQ, VJD, MD, and KPX. Traffic: (May) K1WAB 1089, W1EMG 519, UKO 254, LYL 233, EPE 173, IBE 132, AVY 81, CLF 62, LM 37, WU 8, DFY 6, CAM 2, BB 1. (Apr.) K1WAB 953, W1BGW 52, QLT 8, ABJ 2.

**WESTERN MASSACHUSETTS** — SCM, Osborne R. McKeraghan, W1HRV — SEC: RRX, RM: BVR, PAM: QWJ. The WM C. W. Net meets on 3560 kc. Mon. through Sat. at 1900 EDST. The WM 'Phone Net meets on 3870 kc. Wed. at 1800 EDST. The 'Phone Net is coming along fine with SYX as net control and MNG liaison to the C. W. Net. A Section Net certificate was issued to WEF. VNH is a new EC. BYH, Fitchburg, is a new OPS. COI's OPS certificate was endorsed. AJX received a WANE certificate. YCU made WAS on 'phone with a Viking I. TVJ passed the 2nd-class commercial radiotelephone exam and will try for 1st-class soon. BVR had a visit from KH6AR. BYH and CKC have their General Class tickets. WN1DGL and CMS expect General Class tickets soon. ICW is C. D. Area 4 Radio Officer. QLZ has built a mobile rig. NPL is holding code practice for several SWLs. DPY is going s.s.b. with a 10-B. The Montachusett Amateur Radio Club, Fitchburg, is newly affiliated with ARRL. SPF reports hams in the Worcester Area did a fine job helping to locate a downed plane. The HCRA group of 30 enjoyed a visit to ARRL Hq. with BDI and CUT as hosts, followed by a trip to W1AW. The Amateur Radio Assn. of the University of Mass. has new officers: VSX, pres.; UAN, vice-pres.; San Soucie, treas.; URI, secy. The Worcester C. D. 'Phone Net drills Mon. at 1700 on 28.72 Mc. WPW, formerly of E. Mass., is active on the 75-meter traffic nets with a Viking II and a 5X99 from Athol WN1ZBA and DOI have their General Class tickets. LRA is in charge of RACES communication in Westfield. A new Novice in Springfield is WN1FKP. ALL, LIW, TAY, OUI, and WXF are very active with mobiles. Traffic: W1HRV 146, BVR 112, RRX 85, WEF 78, MNG 48, ZUU 34, ABD 26, TAY 22, AJX 16, YCU 14, BYH 10, HRC 10, DVW 8, DPY 4, WPW 3.

**NEW HAMPSHIRE** — SCM, Harold J. Preble, W1HS — SEC: BXU, RMs: CRW and COC, PAM: CDX. Note that COC has been appointed an additional RM. He and CWX will divide the State between them. Contact either one for information. CDX is PAM and wants more OPS for the traffic net. CCE has been appointed OPS. The Concord Brasspounders held an initiation May 14th. Ten candidates were made members. W1QGU/K2BH is back at Snowville for the summer. CWX made BPL in May. APIK's son Bruce is now N1E2C. DAE has his General Class license. IP says traffic is slack and he is chasing DX. Welcome to Novices N1FTZ and N1ELW, father and son, also N1ECB, N1ECC, N1EEQ, N1EET, N1EFY, N1EJB, N1ELW, N1FCU, N1FDC, and N1EHE. The Great Bay RA held its annual clam chowder May 21st at the Hampton Beach Fire Station. Seven radio clubs from Massachusetts and New Hampshire were represented. Many old-timers will be grieved to learn of the sudden death of ex-W1CMR, formerly of Manchester but later New York. ARR is working VKs, ZLs, and KH6s on 40-meter c.w. during the early morning hours. Traffic: (May) W1CRW 505, ARR 217, WUU 45, CCE 24, COC 19, HOU 16, FZ 9, CDX 7, IP 7. (Apr.) W1CRW 422, GMH 22, ZIW 13, WBM 12, YHI 7.

**RHODE ISLAND** — SCM, Walter B. Hanson, jr. W1KKR — SEC: TQW, PAM: VXC. RM: BTW. The PRA Dinner Dance was attended by more than 250. AEI received the "outstanding ham" award, and there were prizes galore. CRA's new officers are BTV, pres.; ZPG, vice-pres.; POP, treas.; BQH, secy. The CRA also set up 2-meter gear at the YMCA and handled over 100 messages for the public, relaying to BTV and the First Regional Net. VXC reports RIIN on 29.260 Mc. really is rolling with more cities reporting in at 1930 EDST. YAO checks in on the Newport County Net on 29.530 Mc. and is working on an ARC-4 for 2 meters. There is much more activity on 10 meters since the band has shown signs of life. Heard regularly are MK, CEW, HJB, VWR, SBP, HEH, KKE, YYQ, and mobiles YKQ, BTV, OAV, and RVO. A report was received from 4CVO/1, via Rawlins, Wyo.; who needed a vacation after a teaching course at NCRC. YNE is back on and racking up log time. He says the W4s are the best for QSLs. Lots of new gear is going in at the Situate Control Center. NZR can be found there almost every Saturday afternoon and could use a hand now and then with the equipment. Traffic: W1BTV 376, VXC 102, UTA 55, ZXA 31, ZPG 25, CEW 12, W4CVO/1 12, W1ZDS 8, YNE 6.

**VERMONT** — SCM, Robert L. Scott, W1RNA — Nets: VTN meets on 3520 kc. Mon., Wed., and Fri. at 1830 hours; VTPN on 3860 kc. Sun. only at 0930 hours; GMT on 3860 kc. Mon. through Fri. at 1200-1300 hours; Vt. C. D. Nets on 3993 and 3501.5 kc. Sun. at 1000 hours. Several of the boys have sent me AREC applications. Thanks for the new applications. They have been forwarded to our SEC, SIO, of Brattleboro. Ann, OAK, our RM, is working on net certificates for the c.w. gang. You would have had them sooner if it hadn't been for yours truly. I have been kind of lax in getting some of the things done I should have. Various

# MALLORY HAM BULLETIN

Type "M" 4 Watts

For every amateur  
or professional application . . .

## MALLORY Wire Wound Controls

The year after year continued preference for Mallory wire-wound controls, in amateur handbook and magazine "how to build it" articles, is a wonderful testimonial to the technical skill and ability of Mallory engineering. Continued amateur patronage, plus enthusiastic acceptance by professional users, has made the production of small wire-wound controls at Mallory a highly controlled and uniform process.

The manufacture of high quality wire-wound controls has been a specialty at Mallory almost as long as such controls have been used by radiomen. As a result, practically every style and resistance value needed for amateur or professional application will be found listed in the latest Mallory catalog. There is a style or value for use in just about every circuit around the ham shack—"S" meter circuits, bias control in the cathode of RF, IF, and modulator tubes, excitation level adjustment in crystal oscillators, "T" and "L" attenuators, and all sorts of test equipment circuits, to mention only a few.

For your information and possible help the next time you require a wire-wound control, a few of those available in the latest Mallory catalog are listed and described below.

**"C" TYPE 2 WATT WIRE-WOUND**—This control is one of the smallest capable of dissipating a full 2 watts. It measures only  $1\frac{1}{4}$ " in diameter, and as a result it is a handy control for many bias, "S" meter, and other low voltage applications where physical size is a factor. It features a grounded rotor arm, screw driver slotted shaft, and a full  $266^\circ$  of electrical rotation. Resistance values from 6 to 15,000 ohms are available.

**"R" TYPE 2 WATT WIRE-WOUND**—The "R" control has many amateur applications. Its 1500 volt AC insulation between shaft and resistance element, and its dust proof phenolic case, make this control safe for amateur circuits where high potentials may be encountered. The shaft is a thumb knurled and screw driver slotted stub  $\frac{1}{4}$ " in diameter to which a special 3" extension shaft may be added when desired. The "R" control is made in resistances from 20 to 5000 ohms.

In addition, the Mallory catalog lists a variety of resistance values in "T" and "L" pads. Center-tapped wire-wound controls and units with tapered windings for special service are all available through your nearest Mallory Distributor. See him today for Mallory wire-wounds, power resistors, carbon controls and those other Mallory components you need to keep your equipment in good operating condition.

*In the meantime, watch for the announcement of new Mallory power controls from 25 to 500 watts.*

**"M" TYPE 4 WATT WIRE-WOUND**—This control is the old stand-by used by more amateurs than any other made. Wherever variable resistors of 4 watts or less are required, the "M" control should be the logical choice. With resistance values of 0.5 to 70,000 ohms available it is universally acceptable for voltage division, bias control and test instrument circuits of all kinds.

**"E" TYPE 7 WATT WIRE-WOUND**—The 7 watt "E" control fills the gap between the low power "C", "R", and "M" controls, and the higher power and more expensive units of 25 watts. This control is particularly well suited for use in screen grid and similar circuits where voltage division or adjustment is desired. Nine resistances are available from 5,000 to 150,000 ohms.

certificates sent me for renewal, as well as new appointment certificates, should be in your hands by the time you read this — I said should be! My apologies to all. Traffic: WIOAK 125, AVP 100, RNA 50, 1T 38, BJP 30, KJG 13.

## NORTHWESTERN DIVISION

**IDAHO** — SCM, Alan K. Ross, W7IWU — Kellogg: EC RQG reports that WHZ has dropped the "N" from his call. RSQ's XYL is now WN7ZPP. Ririe: LQU had a nice vacation at Victoria, B. C., visiting VE7s SW, WL, and YU. Gifford: VWS knocked off contacts at the rate of 4 per day during May, with a little 1X like KG1AA, VE8CG, and Greenland on the side. A nice letter was received from FIS, now in Missoula, formerly from Hayden Lake. The rig still is a Bendix TA-12 and an SX-24 receiver. The Hammond organ also is competing with ham radio. Emmett: HOV is the new EC for Emmett and Gem County. TYG still is doing FB with the "Hambone." Boise: DOH is the new EC for Boise. SUZ has a new Ranger and also is working on a radio-controlled model plane. SHN moved to Burley with the CAA. You fellows with QTHs and calls not listed above, please drop me a line. Traffic: W7RQG 25, IWU 6, VWS 2.

**MONTANA** — SCM, Leslie E. Crouter, W7CT — The Billings Emergency Corps is continuously monitoring 3920 kc. from 9 A.M. until 9 P.M. daily except Sun. and holidays. MVN has moved to Glendive to take a new job in the radio phone service for the Mountain States Telephone and Telegraph Co. CT has started construction on his new home in Helena. Les will have a 15- by 20-foot room in the basement finished suitable for his radio shack and also is going to put up a center-fed 80-meter antenna on 60-foot poles. MOF recently moved to Billings and is sporting 160 watts mobile. YLH now is operating s.s.b. GFV is using his new recently-built mobile rig. SMY has a new vertical 44 feet high and is working 40 and 75 meters with it. RDN has a new 2-meter rig. TTC is working for the Yellowstone Park Forest Service this season. LBK is building a new garage 32 by 24 feet. KGF, GFV, and YZQ are redesigning and rebuilding the club rig for the Billings gang. OQI will have the amateur radio booth at the Yellowstone County Air again this year and will have a rig on the air hoping to impress the public by conducting an emergency drill from the fair grounds. Traffic: W7LBK 9, MQI 2.

**OREGON** — SCM, Edward F. Conyngham, W7ESJ — The OO reports indicate many 80-meter Novice operators have not checked for second harmonics — outside the band. ISP advises that the Medford 10-meter Net is drilling each week for AREC work. QCL, MAO, KAB, QVY, SCF, and TMF are all busy building 160-meter rigs. PRA has a new HRO-60 and tape recorder. VBF graduated from high school and now is QRL building a 2-meter rig. TIR reports his dad has dropped the "N" from his call, UXR. VLE still has 12 feet of snow, which is preventing him from doing antenna work. EZR reports the Grants Pass Radio Club held its annual picnic with an estimated 25 mobiles and an attendance of about 95. YET and LNG, from Medford, and FRO, ULR, and DBZ, from Ashland, attended. APF still is battling Tennessee Valley Indians. UZU now has a new 50-foot mast for a beam to go with his one-quarter-mile antenna. UJ and FKS are off for vacation. RIM is off to summer camp and more school. UNY has completed installation of K7WBL. JRU and SBU are heard on 160 meters often. Traffic: W7ZFD 456, APF 252, QKU 129, WLL 114, WAT 75, BVH 39, PRA 33, THX 33, TIR 31, BDU 29, OMO 21, HDN 15, LT 8.

**WASHINGTON** — SCM, Victor S. Gish, W7FIX — SEC: RCM. RM: RXH. PAMs: EHH and PGY. YJE advises that 21 of the boys now are checking in on 6 meters. State Civil Defense is attempting to enlist the services of net members to round out the radio relay system. BA visited 6NCP on a trip to W6-Land. TMO is putting up a 50-ft. Trylon tower and 20-meter beam. PHO still is chasing DX and the boys are razzing him about his fist. WAM is adding lines to his agency representation — Ray and the XYL "Henry" (WN7YQS), regulars at the North Seattle Club. K6BDF/7 is asking about underground antennas to get away from summer QRN. VI is handling traffic on UTL 40-meter schedule. PGY has a new Morrow receiver and converter for his mobile. JPH has a new QTH north of town. CBE built a new "Q" multiplier that really does the work. TWQ reports for the Marysville High School Club. Club equipment was loaned out for the summer to YGL and YHR. The traffic boys are worried about the ban on KA traffic. A new 'phone traffic net is in the offing, covering RN7 territory. FRU is griping about military stations accepting Armed Forces Day traffic for the Far East when traffic was not accepted overseas. OE has the shack completely remodeled with a Ranger, SX-99 and control panel all within easy reach. AIB still is experimenting with antennas. ULK found her Viking trouble. FZB copied 60WP for 35-w.p.m. CP certificate. GAT, as with all publishers, is QRL. RHD is completing the 813 rig, modulated by 811s. LVB is building a big rig with parts from the OM, 6HTN. AVM still is waiting for a break in the weather to get up his 2-meter beam. JEY has a new mobile on 75 meters. UZB is starting a 2-meter net, 145.8 Mc., 8 p.m. Tue. UKI is working on 420-Mc. gear. CWN is DXing on 20 meters. PKR is uranium hunting. ULA built a new

"Vest-Pocket"

# TRI-BANDER ROTARY BEAM

with **\*AUTO-LECTRONIC** Change-over

✓ **ONE Beam**

✓ **ONE Coax Line**

\*All you do is tune your rig for operation in the band desired. The MOSLEY TRI-BANDER automatically selects the right combination of elements to give True Beam Performance on that band!

The Tri-Bander is a compensated type beam with four elements mounted on one 15' boom. Two elements function for 20 meter operation and the other two for 15 and 40 meter. Because the latter two bands are not in direct harmonic relation, the beam operates at somewhat reduced efficiency at 21 mcs. but gives maximum performance at 7 mcs. and 14 mcs. Forward gain on these bands is 5 db. and front-to-back is 20 db. SWR is 1.1/1 at resonant frequencies. The Tri-Bander is complete with coils, Auto-Lectronic Coupling Yoke and all necessary hardware. Element sections are pre-drilled and color coded for fast assembly.

Model VPA-3B. Amateur Net \$135.00

Operate any frequency in the two meter band! Replace those 8 mc crystals with this compact, easy-to-assemble VFO kit

## JOHNSON TWO METER VFO

Temperature compensated and extremely stable, this compact Two Meter VFO kit is designed to replace 8 mc crystals in most existing two meter transmitters, including types using overtone oscillators. The easy-to-read, edge-lighted lucite dial is calibrated from 144 to 148 mc with 7 to 1 vernier tuning provided . . . output frequency range is 7.995 mc to 8.235 mc and a separate 7.995 to 8.235 mc dial calibration is provided to facilitate calibrating the unit with 8 mc crystals. Power requirements are only 6.3 volts at .3 amp and 250 to 325 volts at 10 ma and may be taken from the transmitter with which the VFO is used. (Power cable and octal power plug are furnished with the unit.) Tube line-up: 6BH6 series tuned oscillator and an OA2 voltage regulator. Dimensions, only 4" x 4½" x 5".

Cat. No. 240-132 Viking Two Meter VFO Kit including complete assembly instructions, tubes and pre-calibrated dial

**\$2950**

antenna-tuner which licked most of his BCI. HDT is trying out 2 meters. TIQ is de-bugging the rig, but is active on c.d. and MARS. Traffic: W7BA 1574, PGY 1267, VAZ 866, FRU 569, OE 107, USO 99, APS 89, UYL 59, RXH 51, UIN 46, FIX 21, K6BDF/7 18, W7EHH 16, FWD 16, AIB 14, PQT 14, HDT 10, LVB 10, GAT 9, EVW 6, FZB 4, ULK 4, AVM 3, JEY 2, RHD 2, YJE 2, UZB 1.

### PACIFIC DIVISION

**HAWAII** — SCM, Samuel H. Lewbel, KH6AED — Here is the call for the c.w. gang. Get in touch with your SCM and we'll get an all-islands c.w. net going. Once that is rolling we will arrange for scheduled outlet into the transcontinental system for deliveries into all the states. With 2-meter activity on the upswing 3 OES appointments were made: KH6LD Henry Loo, KH6ZD Lawrence Ching, and OS Tom Hori. LD, mobile on Maui, and AED, on Oahu, made 2-meter history with an inter-island contact. LD is running less than 2 watts output to a ground plane on the roof of the car. Who will be first with the Hawaii-Oahu contact? Traffic: (May) KH6AJF 1895, KA2GE 850, MA 812, AK 538, KR6KS 331, KA2HQ 232. (Apr.) KA2GE 1006.

**SANTA CLARA VALLEY** — SCM, R. Paul Tibbs, W6WGO — SEC: NVO. ZRJ tuned up his antenna and is getting out very well now, thanks to George Grammer's advice. Doc and Ann attended the Pacific Division Convention at Fresno. K6CRN is working on MARS under the call AA6CRN. FON received his license renewal. AIT finished power supply for a new final using a pair of 811s. YHM returned from the East Coast in time to attend the Convention at Fresno. Don left for KL7-Land a few days after returning from the Convention and expects to be in Alaska for about three months. On his return he will be back on the traffic nets again. KIN just finished a 20-meter beam using inductive coupling rings. Others at the Convention were K6BBD, W6HC, WGO, SHK, APV, YPM, FYM, and BPT. ZRJ now is Manager of RN6. Doc should have the net operating on a five-night basis again by the time this is read. NCN needs more stations in Northern California so as to be truly NCN. Stations are needed in Sacramento and up Redding way. Anyone in the Mt. Shasta Area will be welcome. There also is need for a station from the 'phone nets to work on RN6. Traffic, both outgoing and incoming, would then be handled much faster. How about it, gang? Let's make this section again a leader in traffic-handling as it was in the "good old days." Traffic: (May) W6YHM 138, HC 135, ZRJ 67, FON 61, K6BBD 52, W6AIT 39, UTV 36, K6BAM 33. (Apr.) W6HC 95.

**EAST BAY** — SCM, Guy Black, W6RLB — Asst. SCM for V.H.F.: Ollie Nelson, 6MXQ. Asst. SCM for TVI: Harry Cameron, 6RVC. SEC: WGM. PAM: LL. RMs: IPW, EEF, and JOH. JZ reports he is looking forward with pleasure to a period of relaxing from the duties of office. Maybe he will get some of that equipment built. US now is permanently in Los Angeles. EE is at Zephyr Cove, Lake Tahoe. One of our old-timers, Bud Stedinger, CX, passed away suddenly. LHJ is a very active new Novice in Centerville. The *SARO News* is one of the better and more complete club papers published in Northern California. The East Bay section was well represented at the Pacific Division Convention in Fresno, and assisted the Fresno gang in many ways with the programs. "Operation Alert 1955" saw amateurs participating fully. Several civil defense leaders have gone out of their way to express their full appreciation. ITH has been traveling through a fascinating bunch of DX countries. The Albany Hi-Hi CQers club station, K6EPE, is now an Official Bulletin Station. The East Bay Radio Club heard talks by Walt Serniuk, K6HQE, formerly W2JAR, and Ray Renaudo, W6KEV, in May and June. The V.H.F. Party in June was highlighted by the activity of the V.H.F. Expeditionary Society, which set up equipment at a spot on route 88 known as Ham's Station, California. Traffic: K6GK 125, EPC 24, W6YDI 2.

**SAN FRANCISCO** — SCM, Walter A. Buckley, W6GGC — Asst. SCM: William T. Nakahara, 6GHI. The Sonoma County Radio Club had ALF as guest speaker for its May meeting. Frank gave an interesting demonstration and talk on the tune-up procedure of his beams. LOU's XYL, Mae, is waiting for her Technician Class ticket and K6ITY's XYL, Joan, is awaiting her Novice Class ticket. K6BWQ moved from the Bay Area and has settled down in Eureka, Calif. He is one of the telephone company's salesmen. Members of the San Francisco Naval Shipyard Club held their annual dinner at the El Portal Cafe May 21st. Your SCM had to miss it as the family had tickets for the Fresno Convention. HAMS (the Red Cross Club) had Field Day business and a 6-meter discussion at its May meeting. SDN, KFS, URA, TTB, JAA, CAN, ULA, OJT, PBC, GCG, VWK, VJI, BAZ, YQI, AJF, VSV, BHR, JKN, MXQ, K6s ELV, EGU, ELU, HHL, NCG, APB, BAO, HEZ, and GGC are all listed as 6-meter boys locally. K6ELV now is mobile on that band. Net control for 6 meters is URA, who sports an unhooked-up 829B Tripler final and a four-element beam. Neighbors can't blame him for TVI. Many of the local 29ers Club showed up at Fresno but the 10-meter transmitter hunt signal was not loud enough to be heard by the gang. The 75-meter transmitter

(Continued on page 94)

# Towers! Towers! Towers!

**CRANK UP and DOWN • TILT OVER • HURRICANE PROOF**

## TILT OVER Ground Post

The E-Z Way Rotary Beam Tower is the answer to a Ham's dream! Tilts over, cranks up and down — and so easy to install. Antenna adjusted in a wink. Ground post is included. You'll find E-Z Way Towers the sturdiest and most versatile towers in the sky.

Six types made from 40 to 65 feet. Each designed for different antenna loads at specific heights. Cranks down and tilts over for easy adjustment. No guy wires needed. These towers are also available with brackets for attaching to building wall at lower prices. No ground post necessary when attached to building.

## FOLD OVER

Three types of Fold Over with gin poles in 40 and 50 foot heights. Cranks up and down. No guy wires needed on tower.

Gin Pole mounting is 20' galvanized structural iron pipe with double hinged base and crank, pulley, cable to crank to perpendicular position. V bracket locks to tower.

Provisions to mount rotor inside top of tower. Bearing at A and B relieves all strain from rotor.

## BUILD IT YOURSELF

20 foot lengths for easy assembly to any heights desired. 320?

### C-10

Width 10"  
Maximum Height 120 ft.  
Guy Spacing 27 ft.

### C-15

Width 14"  
Maximum Height 200 ft.  
Guy Spacing 40 ft.  
Weight per ft. 8 lbs.

### C-25

Width 25"  
Maximum Height 320 ft.  
Guy Spacing 80 ft.  
Weight per ft. 20 lbs.

Used extensively for VHF and UHF communications antennas. Two other sizes available. When maximum height and guy spacing are not exceeded, tower will withstand 60 lb. wind load.

## FLIP OVER

"for the mile-high boys"

Gets you up in the air but Flip Over makes adjustment easy. In 80, 100 and 120 foot "Cloud Buster" heights. Sturdily made, cranks up and down. One of our finest towers.

## WRITE DEPT. T FOR CATALOG

When writing, please specify type of tower in which you are interested, height and expected antenna load.

### Centralab Temperature-Compensating Hi-Kaps®

A wide range of values to choose from — to get close tolerances . . . high physical strength . . . high lead strength . . . fast response to temperature change.

There are four basic types of Centralab Temperature-Compensating Tubular Ceramic Capacitors:

1. **TCZ (NPO)** — Shows no appreciable change in capacity over a temperature range from  $-20^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$ . Capacities, .5 mmf. to 300 mmf.
2. **TCA (N330)** — Shows a negative change in capacity of 330 parts per million per degree C. Capacities, 10 mmf. to 100 mmf.
3. **TCN (N750)** Shows a negative change in capacity of 750 parts per million per degree C. Capacity, 3.3 mmf. to 750 mmf.
4. **TCL (N1500)** — Shows a negative change in capacity of 1500 parts per million per degree C. Capacities, 3.3 mmf. to 750 mmf.

When drift's your problem, lick it with Centralab Temperature-Compensating Hi-Kaps. Get them from your Centralab distributor.

Send coupon for Centralab Catalog No. 29.

hunt was a huge success, though. Wrong-way CTH was last in; they almost sent a search party out to find him. IDF spoke on modern trends in amateur receivers at the U. C. Campus on May 24th. Sorry he couldn't stop over longer and give the same talk to some of the local radio clubs. Sixty-nine members of the Mobilizers held Sunday morning breakfast at the Belmont Motel at Fresno. Mr. Morrow, of the Morrow Co., gave a very interesting talk after breakfast and told the boys how to eliminate some of the mobile transmission noises. OPL's XYL won the main prize at the YL's luncheon. GGC and family enjoyed the Friday night dinner with the Buzzards. There was a grand entertainment after dinner. Dr. Lester Reukema, of U.C., spoke at the May meeting of the SFRC on "Industrial Application of Atomic Energy." The fellows kept him busy answering questions after a very interesting talk. Thanks to ATO for obtaining such a wonderful speaker. BIP was a very busy man in May getting rigs and manpower in line for the SFRC Field Day. YL *Splatter*, the local YLRCSP Club paper, notes new members as K6AIU, W6DHV, and K6BMQ. K6EEE operated her home to YLs, OMs, and jr. operators on May 14th. Even the OMs admitted that they had a grand time. Rae, the 17-year-old YL of GGC, made a "writing date" with some of the boys at Litchfield Pk. and said she should have studied code because Gordon's dad was sending c.w. FVK came back via 'phone so she only heard a one-sided conversation. PHS, the OM of QMO, promises to write some short articles about radio theory for the YL Club. OMO is checking in again with MTN but stays on the American Legion frequency most of the time. AIH lost his way and couldn't even make it in last at the May 29ers hunt. KN6HIW completed a custom-built console for her rig. GQA sent in a most interesting OO report. He gave a frequency check to one of the Mexican stations. He says he expects a lull in activity for the summer months. CBE noted that he had very pleasant visit with the Headquarters gang in Chicago during the recent Elect. Parts Show. Sorry to have to list Dr. Turkel, OVM, on the Silent Keys list. Condolences to his family. Traffic: W6QMO 309, GGC 43, GHI 42.

**SACRAMENTO VALLEY** — SCM, Harold L. Lucero, W6JDN — ASI finished a pair of 4-400As in Lin amp. for his s.s.b. 20-A. JEQ is having trouble with his mobile in the new station wagon. HSB is counting the days until his retirement in August, when he will have full time for ham radio. LLR has his BC-610 TWed and puts out a whale of a signal on 75 meters. MIW has a new Viking Ranger and is planning an amplifier for it. ILZ has another call at his business location, K6KPG, and is running a full gallon. ESZ, master craftsman with a lathe, should see his equipment on all bands. DBA has the TCS mounted in his car and is active on MARS. ROO has the GO-9 on with vertical antenna and is DXing on 40 meters. RNR assumed the prexy job of SARC and is busy on 75- and 20-meter 'phone. QDT, having moved to Modesto, reports he is active on MARS now with 250 watts and a temporary horizontal antenna, and is going on 144 Mc. GDJ is DXing on 20 meters with a new antenna system. AK has returned from an extended trip to Detroit for a new Cadillac and brought back an SSB-20A and a new 75A-4 receiver. GKW is active on 75 meters. MYT is active on MARS and in frequency measuring work. TYC, with CMQ and approximately thirty mobilizers, on June 5th mobilized to Pollock Pines on Highway 50 for a picnic, transmitter hunt, and family day. WUE, new operator at the McClellan MARS station, is active on the American Legion Net on 3975 kc. K6LCY, a ham of years ago, returned to the amateur ranks with a new call. Welcome back. DEO is active in c.d. work. The Convention has passed so now let's look forward to the National Convention that is coming to the West Coast. Traffic: W6CMA 82.

**SAN JOAQUIN VALLEY** — SCM, Edward L. Bewley, W6GIW — SEC: EBL. RM: K6EVM. PAM: WJF. The Pacific Division Convention held at Fresno was a huge success, with an attendance of 752. The gang at Fresno is to be congratulated for a swell job. Word has been received that WJF and FEA are leaving this section and moving to San Francisco. I received a letter from TFD. Eldon is on an LST in the Japanese waters. K6BMM has a Gonset converter and a new dynamotor in the car. ADB has converted a BC-453 to an s.s.b. exciter. Very few reports were received this month, and as this will be my last report as SCM I wish to thank all the gang who have helped me and the section in the last two years. The San Joaquin Valley section has made great strides in organization and activity, and it is all because of the splendid cooperation of the whole gang. K6EVM announces a change in CVN time to 8:00 p.m. Chuck is working hard to keep the section net operating, and would like to see more stations take a part in the net. The section nets are the heart of the National Traffic System, and offer a wonderful opportunity for those interested in c.w. to get in some pleasant operating time. There is room for the beginner as well as the old-timer on the net, and the section net is ideal for the slow operator who wants to increase his speed. Check in on 3525 kc. at 8:00 p.m. Traffic: W6FAE 314, ADB 220, K6EVM 64, W6EBL 21, K6BMM 5, W6WJF 2.

## ROANOKE DIVISION

**NORTH CAROLINA** — SCM, Charles H. Brydges, W4WXZ — SEC: ZG, PAM: ONM, RM: VHH, CVX has a new HRO-5 receiver and has completed WAC-phone on 20 meters. SOD has a new Viking Ranger and Viking KW plus vertical. The Roberson Emergency Net meets on Wed. at 4:30 on 28,800 kc. ACY reports 22 members on 14 Mc. in the Greensboro Area. The Greensboro 2-meter Net meets at 1800 on 146.88 Mc. BDU reports that his new Vertical worked swell in the CD party. BUA put up a new Windom antenna and had some surprising results on 75 meters. EZ11 is getting his antenna working well on 75 meters with his Globe King. GHQ has his modulator working again plus a new antenna and is having lots of fun. I received only a few reports about a North Carolina traffic net. If any more of you are interested, please drop me a line and maybe we can organize a good net. SOD reports that the Tarnetto Amateur Club has received its notice of affiliation with ARRL. CEN is working Gs and handling messages on 20 meters. The Confederate Teenage Net is meeting on 3950 kc. at 4:00 p.m. for the duration of the summer. YPY is working 40-meter c.w.-phone with good results to W6-Land. ZKE has a new SX-96 receiver and Charlie also is working on a 20-meter beam and a 35-ft. pole for support. BDU, VHH, and WXZ were on for the CD Party and a good time was had. FNV finally got his Globe Scout working and is back on 75 meters. VFK was in the hospital but now is back in the swing and doing FB. FHH has a new single 813 and is doing a good job on 75 meters with about 300 watts. Thanks to all for the fine reports. Traffic: W4BDU 36, DRC 20, WXZ 18, YPY 8, ACY 6, ZKE 6, BUA 4, BUW 4.

**SOUTH CAROLINA** — SCM, T. Hunter Wood, W4ANK — 9JBN/4 reports that K4ADO has a new Globe Scout on the air from Myrtle Beach. YAA has graduated from Clemson and will be on 'phone soon with a BC-696 using screen modulation. LXX reports from Florence that he plans to bandswitch his transmitter, that FGX is receiving rare DX cards and needs only two for WAS, and that AUL, TSU, and LLH were erroneously reported as planning high-power mobile. They are planning high-power home rigs. TSU has almost finished his kw. rig. AUL soon will be on the low end of 20 meters with his half-gallon. On May 13th the Governor signed into law a bill authorizing full-size license plates for South Carolina hams. The amateur plates with calls will be displayed in lieu of regular plates. Regular plates must be obtained but the amateur plates will be displayed. Cost of the amateur plates is \$1.00 in addition to the regular license fee. Novice or commercial vehicles are not eligible. NJG, GQV, HDR, and HMG deserve special mention for successful efforts in facilitating passage of this bill. Principal supporters in the General Assembly were Senators Grant of Chester, Spigner of Columbia, Wallace of York, and Representative Cushman of Aiken. Mr. John Denny, Esq., Columbia attorney, also deserves special mention. Traffic: W4HDR 303, AKC 123, FFI 89, ANK 82, K4ADD 38, W4FML 22, YAA 17, W9JBN/4 3, W4YAA 2.

**VIRGINIA** — SCM, John Carl Morgan, W4KX — SEC: RTV. Reports are gratifyingly plentiful this month. Thanks, gang. PFC and BLR made BPL, Kay's second leg on that medalion. We enjoyed meeting so many at the VFN picnic at HQN's. Details on the Virginia QSO party will appear next month. New clubs include the C. & O. Ry. Employees ARC in the Richmond Area and the Southwestern Va. ARC, with headquarters in Radford. The Tidewater Mobile Club did the usual fine job on the Marathon Outboard Races. The Shenandoah Valley ARC has a fine new club house. The Central Valley ARC is operating an active local net on 29,456 kc. K4NCP is the club station at FADTC Dam Neck. New VFN mgr. YVG is QRL tooting the sax at Virginia Beach. The new VFN asst. mgr. is KZS, ONV continues as secy.-treas. PXA is keeping VN boiling five nights a week through the summer, with newer members "breaking in" as NCS. The younger contingent, including APM, WDZ, TFX, ZFV, and others, say they'll be more active now that school is out. K4ASU is making a net directory of VN/VSN and wants the complete dope on all. There are complaints aplenty on QRM on 4RN's frequency. Welcome to ex-Minnesota SCM, 0EPJ, now 4EPJ. KVM is now KG1JB in Greenland, according to KFC, who snagged MP4QAL for No. 227. ZZL is taking portable to his summer job at Shrine Mont. Squirrels KN4BBR and KN4CAX snagged LU1EK in the Novice band! K4BNI/BNG report activity in the Warrenton Area. K1CQZ and 2JWD/4 are readying 2-meter gear on the Eastern Shore. JUJ is back chasing DX on 20 meters. AAD finally is taming the 833-A final. CWB's big vertical is amusing passersby, who stop to ask if he is "knocking off their ball games." Fortunately he can say no. Traffic: W4PFC 819, BLR 743, AMZ 128, CGE 57, YVG 43, K4ASU 39, W4YKB 33, PXA 29, EPJ 27, WYC 15, K4NCP 14, W4AAD 10, APM 8, TYC 7, WDZ 6, KFC 5, JUJ 4, LW 4, IF 2.

**WEST VIRGINIA** — SCM, Albert H. Hix, W8PQQ — SEC: YPR. PAM: GCZ. RMs: DFC, GBF, HZA, and JWX. The Princeton Club had a good turnout at its recent picnic. It is requested that all hams in the State who can

assist in emergency work, register as AREC members with the SEC and ECS. Please take time now to drop YPR a card in reference to this. IRN just completed a new kw. rig. The Clarksburg Club is enjoying an increase in activity. JWX has a new VFO and rig. BWK is in the process of putting up a new 60-ft. antenna pole. NYH is very QRL now but manages to keep on the air. The West Virginia C.W. Net will operate a summer schedule on Mon., Wed., and Fri., at 7:00 p.m. EST through the month of August. OIC plans to increase power soon. GCN is doing a bang-up job with his s.s.b. rig. TMI also is on with an s.s.b. rig and is becoming quite active after moving from W4-Land. 3LEZ, president of the Frankfort Club, visited PQQ. TDG is very active on the various bands. BDD is heard on 20-meter 'phone often. I would appreciate having more activity information from all the hams throughout the State. CHP and LSG both have Minibeams on 20 meters which work out quite well. Traffic: WSJWX 163, HZA 130, GEP 115, LYN 65, IXG 58, DFC 22, PZT 21, NYH 20, BWK 15, SEV 12, PRT 8, PQQ 7, UYR 4.

## ROCKY MOUNTAIN DIVISION

UTAH — SCM, Floyd L. Hinshaw, W7UTM — The UARC of Salt Lake City is faced with replacement of its president because of the resignation of UKB. Burns advises he has to be out of town too much to do justice to the club. We are sorry to hear he has to leave at this time. SAZ says that Eric has passed his Novice examination but has not received his call as yet. WQC has a new antenna. BED is living in Cedar City but is not on the air yet. QWH is giving the DX boys a chance at a Utah contact, spending about 30 per cent of his time in the DX activity. QDM operated portable from the National Guard's Camp Williams site during the summer-camp period. MWR is trying to work DX but his results include mostly JAs, VKs, and ZLs. QDJ is having modulator trouble so has been on c.w. more than usual. Traffic: W7MWR 14, UTM 3, QWH 2.

WYOMING — SCM, Wallace J. Ritter, W7PKX — DXV is keeping things going on the YO Net on 3610 kc. in fine shape. LPP is doing lots of mobiling on a new job that keeps him traveling. YSF, SDA, TZK, and TZH assist in keeping the Pony Express Net going on week-day mornings. HDS missed on 3920 kc. while on her vacation to the West Coast. ACG/IDO are trying to decide where to operate the rig from, in their new hobby shop or in the front room. Welcome to YJG and his XYL WN7YWY, who swear their jr. operator already is saying his name in c.w. UFB is mobiling in W9-Land while on vacation. AMU recently was promoted to a full colonel in the CAP. LKQ has moved to a new location. NVI moved out of QRM and now has nothing but ducks and chickens to QRM. NVX is attending school in Chicago. IDO and WN7YWY now are members of the YLRL. IWF is getting acquainted with the boys in the eastern half of the section by holding a hamfest of their own. The Sheridan gang still is working on the new c.d. communications site while getting things rolling for the coming Annual Wyoming Hamfest in Buffalo. PMA, new EC, is learning the ropes about antennas the hard way. Your SCM again requests more news and traffic reports via the nets, cards, or letters. Traffic: W7PKX 191, MNW 27, TZK 23, PAV 3.

## SOUTHEASTERN DIVISION

ALABAMA — SCM, Joe A. Shannon, W4MI — SEC: TKL RM: KIX. PAM: WOG. Two-meter activity is increasing around the State with PRS and TLV DXing with super antennas and high power. Reports show that more 2-meter rigs are being built, with indications that before long we will have a section net on 2 meters. COU hopes to have medium power on 2 meters soon and will be joining the ranks. TKL met with the Cocoa Club while on a two-week visit to Florida. The Section Novice Net, which meets Mon., Wed., and Fri. at 1830 on 3720 kc., is well on its way under the guidance of EJZ. How about more Novices calling into AENA? The more the merrier. Welcome to KN4DFU, in Sheffield. A new club is being formed in Cullman with plans being made for final organization. BMM says they have five with advanced tickets and seven Novices as a nucleus. WOG made a trip to east Texas and visited with W6s JMIN, W1J, KPR, and K5AEJ. HKK was voted "NCS of the month" on AENP, while ZSQ took honors as outstanding net member. CAH spent two weeks in Florida and MI and RLG attended the convention in St. Petersburg. Traffic: (May) W4COU 973, UHA 809, WOG 348, HKK 245, KIX 113, YRO 112, ZSQ 106, ZSH 56, K4ACO 48, W4EJZ 46, RLG 21, TKL 19, HYI 12, PWS 9, BMM 8, OR 7, CAH 2. (Apr.) W4YRO 77, OAO 29, PWS 10.

EASTERN FLORIDA — SCM, John W. Hollister, jr., W4FWZ — Typical of Armed Forces Day activities was that at Jacksonville. UHE, UHY, DSC, WEO, TRN, NKC, HKR, YNY and others plus help from WMBR, WPDQ, and WJHP/TV, accounted for a successful day for the special station in a downtown park. JOCO 2 was great under the direction of IM, our SEC, plus IYT, LFL, EHW, DRD, PZT, BWR, ZBA, HPT, PPH, GFF, DER, KN4CVB, KN4ARV, KN9CYY/4, W8OFX/4, PPR,

JZB, PM, and others around the lake area. The State RACES plan is approved. State Radio Officer is UHY and alternates are FWZ and WEO. Lake County: FE reports he and VDY, SXJ, IQJ, and GYB, mobiles, assisted in the Annual Watermelon Festival Parade by shaping it up via radio. The LARA has a Heathkit DX-100. The club call is YKY. Patrick AFB: Armed Forces Day was handled at K4FDC by K4AZA and K4AYX over a 144-Mc. link to the base station. Other operators at the base are IAL and YQC. Equipment includes a BC-610, Collins 32V-2, Collins 51J2, and HRO-50, Ft. Lauderdale: JZB is on 144 Mc. with sixteen elements, Lettine plus Techeratt. YOX runs code classes. IM is on vacation. Lakeland: SCY on 144 Mc. has sixteen elements, Cardwell MOPA, 3E29 final, home-rolled converter into an AR-77, and worked KN4CVC, YZP, and EQN. Lake City: KN4BOS uses a Globe Scout; K4NCS is on at the USNR unit; K4BKV dropped the "N," but KN4DIHK is new. Thanks to YNM at the high school, Miami: New DRC officers are VGT, ERK, WYR, and QLC. Miami wants the ARRL Southeastern Division Convention in '56. Let's help 'em do it, LVV now is DXCCx2! Bird Sparks says the Flamingo Net again will furnish communications for the famed Gold Coast Marathon on July 2nd and 3rd. The Net now has 71 active. Umatilla: AYW uses a Viking II and also is on 50 Mc. with three elements plus 25 watts into a 2E26. Who else is on 6? Traffic: (May) K4FDC 537, W4PUJ 532, WEO 172, BWR 120, YJE 106, IM 85, TRN 84, LAP 74, ELS 71, WS 64, LMT 49, TJU 40, YOX 40, ZIR 40, LVV 35, DSC 33, IYT 33, LFL 33, FSS 31, BZI 26, FE 19, SVB 15, TYE 12, DES 9, EHW 9, WHK 8, FWZ 5, PBS 3, WEM 2, YNM 1. **WESTERN FLORIDA**—SCM, Edward J. Collins, W4NS/RE—SEC: PLE, ECs: MIF and HIZ. K4AKP makes BPL for the third month in a row. The Pensacola Hamfest was a huge success. KN4CLJ and KN4CLK are giving the Novice bands a workout. AXP has the big rig perking again. The Crestview Club (CARS) reports the following active: W4CQX, K4BIMQ, K4BNA, KN4BAQ, K4ADM, and KN4BQY. BGG still is looking for room for his antennas. GMS is home from college for the summer. KN4ADY is getting married. KN4AEP is going up for General Class. DAO/DEF is busy helping new hams. CCY is planning a big steel tower for DX. PQW is planning all commercial gear in the shack. PTK-TTM keep their hand in the local nets. NOX still moves the traffic. BFD keeps wee sma' hours. FHQ is QRL work. ACB visited the Pensy gang. UUF is the 144-Mc. DX station for the south. SOQ has gone to LU-Land. W6UQZ is getting on locally. EAR wants more power. HJA has the mobile gear going in the new 12-volt system car. JPD is getting interested in s.s.b. K4BZX is leaving us. KN4AGM is making the hamfests. PLE and his XYL have an FB jr. operator. VR stays loyal to 7 Mc. PAA operates on 7 and 21 Mc. UCY is happy over 10 meters opening up. ZFL does his operating at the PARC Club station. ZPN is teaching a code group. OOW has renewed his ticket. MS is enjoying 5100-51SB unit on 4.0 and 14 Mc. with s.s.b. ODO, JBJ, and EQR all work in the same lab. ZFL is mobile on a bicycle. MUX is in G-Land. RZV still is the big signal in the Dagwood Net. K4ABN has an FB mobile set-up. OKB is working at Saultey Field. Traffic: K4AKP 756.

**GEORGIA**—SCM, George W. Parker, W4NS—SEC: OPE. PAMs: ACH and LXE. RM's: MTS and OCG. Nets: Georgia Cracker Emergency Net meets on 3995 kc. Sun. at 0830, Tue. and Thurs. at 1900 EST. Georgia State Net (GSN) meets on 3590 kc. Mon. through Fri. at 1900 EST. More than 425 attended the annual Atlanta Hamfest. YWP carried off the main prize, a Heathkit DX-100. An organizational meeting of the Rebel Net, a state teenage net, was held at the Hamfest. ZPS was selected NCS for the 'phone section, which meets on Sat. at 10:00 on 3885 kc. EDB is NCS for the c.w. session on Sat. at 12:30 EST. WKP presided at the meeting. YRX reports that he will be off the air for a few weeks—he is acquiring a new XYL. The Georgia State Net needs outlets in Columbus and Valdosta. How about it, some of you brass pounders? BWD is working on a mobile rig. MA is back on the air after a slight illness. MNJ has been in the hospital at Ft. Benning. BXV now has Vermont for his 48th state on 40-meter c.w. with 50 watts. HAO and OPE are now mobile. Among those from the Atlanta Area attending the Southeastern Division Convention in St. Petersburg were ZD, NS, OPE, WKP, MV, and TO. A new club is in the making at Ft. Benning. Officers will be announced later. Traffic: (May) K4WAR 2103, W4OCG 564, BVE 379, PIM 279, DDD 228, HYV 73, CFJ 56, YTO 44, MTS 28, NS 28, BWD 26, IMQ 24, ZD 22. (Apr.) K4WAR 718, W4ZUF 68, IMQ 36.

**WEST INDIES**—SCM, William Werner, KP4DJ—AAB received OES appointment and is putting up a 6-meter beam. ACF is on 3736 kc. ABA has obtained his General Class license. UY, transferred back to KP4 by the Navy after a year's absence, uses Viking II and VFO. UT is transferring to the States in August. MV's ART-13 changes tone on c.w. Amateur emergency communications were praised by the c.d. chief and space in the Rio Piedras Building was offered and accepted by PRAC. At present

(Continued on page 102)

**HOW TO ORDER:** In order to give the fastest possible service, crystals and oscillators are sold direct. Where cash accompanies the order, International will prepay the postage; otherwise, shipment will be made C. O. D.

## FO-1 PRINTED CIRCUIT OSCILLATOR

For Generating Spot Frequency Signals with Guaranteed Tolerance  
1000 KC to 15,000 KC fundamental operation

Since the operating tolerance of a crystal is greatly affected by the associated operating circuit, the use of the FO-1 Oscillator in conjunction with the FX-1 Crystal will guarantee close tolerance operation. Tolerances as close as .001 percent can be obtained.

FO-1 —Oscillator Kit (less tube and crystal)..... \$3.95  
FO-1A —Oscillator, factory wired and tested  
with tube (less crystal) ..... \$6.95

## FX-1 CRYSTAL Companion to the FO-1 Oscillator

The FX-1 Crystal is designed for use only with the FO-1 Oscillator. For tolerances of .01% and .005%, any FX-1 Crystal can be used with any FO-1 Oscillator.

For tolerances closer than .005% the oscillator and crystal must be purchased together. The oscillator is factory wired, and the crystal custom calibrated for the specific oscillator.

FX-1

Tolerance	1000-1499 KC	1500-1999 KC	2000-9999 KC	10,000-15,000 KC
FX-1 .01%	\$5.25	\$3.75	\$2.50	\$3.25
FX-1 .005%	\$6.00	\$4.50	\$3.00	\$4.00
( .0025% and .001% tolerances are available only by purchasing the FO-1 Oscillator and Crystal together )				
FX-1 .0025%	\$6.75*	\$5.25*	\$3.75*	\$4.75*
FX-1 .001%	\$8.00*	\$6.50*	\$5.00*	\$6.00*

\*Prices are for crystal only. To insure this tolerance crystal must be purchased with oscillator factory wired and tested. For total price add \$6.95 to price of crystal desired.

## ONE-DAY PROCESSING FA-9

FA-9 Spot Frequencies 1500 KC to 75 MC .01 %

**.01% TOLERANCE**—Crystals are all of the plated, hermetically sealed type and calibrated to .01% or better of the specified frequency. See specifications below:

**Holders:** Metal, hermetically sealed, available in .093 dia. pins (FA-9) or .050 dia. pins (FA-5).  
**Calibration Tolerance:**  $\pm .01\%$  of nominal at 30° C.

**Temperature Range:** -40° C to +70° C.

**Tolerance over temperature range** from frequency at 30° C  $\pm .01\%$ .

**Circuit:** Designed to operate into a load capacitance of 32 mmf on the fundamental between 2000 KC and 15 MC. Designed to operate at anti-resonance on overtone modes into a grid circuit without additional capacitance load. Write for recommended circuits.

Orders for less than five crystals will be processed and shipped in one working day.

## PRICES FA-9\* (Pin Diameter .093)\*

Pin Spacing .456 (\*FA-9 fits same socket as FT-243)

RANGE	TOLERANCE	PRICE
<b>Fundamental Crystals</b>		
1500-1799 KC	.01%	\$4.50
1800-1999 KC	.01%	\$3.90
2000-9999 KC	.01%	\$2.80
10000-15000 KC	.01%	\$3.90
<b>Overtone Crystals</b>		
(for 3rd overtone operation)		
15 MC—29.99 MC	.01%	\$2.80
30 MC—54 MC	.01%	\$3.90
(for 5th overtone operation)		
55 MC—75 MC	.01%	\$4.50

## For Commercial Use F-6 Series 1000KC to 60MC

ONE DAY SERVICE

Wire mounted, plated crystals, for use in commercial equipment where close tolerances must be observed. All units are calibrated for the specific load presented by equipment.

**Holders:** Metal, hermetically sealed.

**Calibration Tolerance:**  $\pm .0025\%$  of nominal at 30° C.

**Tolerance over Temp:**  $\pm .005\%$  from -55° to +90° C.

**Range:**  $\pm .002\%$  from -30° C to +60° C.

Send for FREE Catalog covering Crystals available from 100 KC International's complete line. to 100 MC.

**Circuit:** As specified by customer. Crystals are available for all major two-way equipments. In most cases the necessary correlation data is on file.

**Drive level:** Maximum—10 milliwatts for fundamental, 5 milliwatts for overtone.

RACINE, WISCONSIN

a TBS-50 is installed and operating on 3925 kc. AAC and AAO are using s.s.b. ES has a five-element Telrex beam on 20 meters. The Antilles Net now receives weather from Aruba PJ2AO. ACB, located on top of a mountain near Castañer, uses emergency power at all times and reports weather to the Antilles Net for the USWB. DH is trying 'phone since he obtained a Viking II. DV uses an electronic T-R switch for break-in. NY is leaving KP4 for another church assignment in the States. CO suggests a hidden transmitter hunt. HZ, MV, CN, and QA appeared on a 30-minute TV show explaining amateur radio. KD and his son BJ attended the Southeastern Division Convention in St. Petersburg, Fla. WT reminds us that she guards 3925 kc. all day from 7 a.m. to 10 p.m. RK/mobile had a 'phone patch with his father through MV from Mayaguez to San Juan. AZ is putting up a 40-ft. vertical. QR is practicing with a Mon-Key. Traffic: KP4WT 140, DJ 2.

**CANAL ZONE** — SCM, Roger M. Howe, KZ5RM — Acting SCM: P. A. White, KZ5WA. W4UEL and W4DIR came down from Miami to listen to Stateside QRM and visit friends on this end of the QSOs for a change. KZ5BD and DW gave a party for club members at their home after the CZARA meeting in May. KZ5, "Very Romantic" (Virginia) is now on the air. She conducted a very fine code class for CZARA for the last 12 months. The theory class, held the same period, was conducted by KZ5s GD, BD, RM, and FL. RM (also W6OYA), our SCM, is now visiting Stateside and will see W9PNF, ex-KZ5WJ. GD and DG, also in the States, are operating as W0WXL/mobile and W0DLU/mobile. WZ has a new s.s.b. rig on order for 20-meter operation. Three cubical quads were used for 10, 15, and 20 meters under the Field Day club call KZ5KZ, at Gamboa, on June 18th and 19th. Field Day plans were in the hands of RV and CF. Traffic: KZ5WA 153, KA 50, HA 45, VR 16, JJ 15, VZ 9.

## SOUTHWESTERN DIVISION

**LOS ANGELES** — SCM, William J. Schuch, W6CMN — SEC: QJW. RMS: BHG, GJP, and K6DQA. PAMs: PIB and YVJ. The Eagle Rock Teen Age Club is now an affiliated club and the club call is K6LBZ. BES now has a full gallon and a 7-Mc. beam. CBO is putting up a V-32 antenna. K6BFC worked ZD6BX on 7 Mc. with his new 500 watts. BUK has a tower now and an Elmac receiver for the car. New members of the Pacific Club are K6GCN, BFC, CEO, and W6UED. K6EJT is QRL traffic and makes BPL. Congrats. HIF checked into SCN from Portland, Ore. NJU finally made it into Europe, 7 countries in two nights. FB, WT is having fun on 144 Mc. KN6JRY sports a new Harvey Wells. K6EXV is corr. secy. for the L.A. YLRL. KN6KDJ has moved to Washington. K6DQA, W6USY, CMN, GJP, and GYH, all of SCN, attended the Convention in Fresno and all report a swell time. The June '55 *Ford Times* has a nice blurb for ham radio. Among the new Novices in the section are KN6LHA and LML. Congrats. New officers of the San Fernando Valley Radio Club are YSK, pres.; K6ARM, vice-pres.; K6BAU, secy.; K6EIA, treas.; K6KXT, membership; W6UEI, program; and K6EVT, refreshment. FKZ has GP antennas on 7, 14, and 21 Mc. K6JHR has new SX-99 and Viking Adventurer and has just put up a 7-Mc. GP. K6BFC finally is back on the air and also has a new 21-Mc. beam. KZ2BE paid a visit to the shack of GYH. ORS won a Communicator at the Fresno Convention. CMN has new twin Yagi 5 on 144 Mc. BHG is QRL with traffic skeds and OBS duties. K6DQA is the new manager of the Southern California Net. Don't forget the San Diego Convention, Oct. 1-2. It is with regret that we report the passing of Harold F. Wood, QVV, June 7, 1955. Traffic: (May) K6EJT 530, W6USY 284, GYH 279, K6DQA 153, W6BHG 146, WPF 129, CMN 122, CAK 104, CK 64, KN6HOV 59, K6COP 51, BWD 23, W6YVJ 23, HIF 19, GJP 14, WT 12, ORS 11, K6ELX 10, BEQ 8, W6CBO 8, NJU 2, EUD 1. (Apr.) K6BFC 136.

**ARIZONA** — SCM, Albert H. Steinbrecher, W7LVR — Asst. SCMs: Kenneth P. Cole, 7QZH, and Dr. John A. Stewart, 78X. SEC: YRB. PAM: KOY. The Arizona 'Phone Net meets Tue. and Thurs. at 7 p.m. MST on 3865 kc.; the Arizona C.W. Net Tue. and Thurs. at 8 p.m. MST on 3690 kc. The outstanding event of the month of May was the Annual Montezuma Well Hamfest, which was bigger and better this year than in all previous years. There were approximately 275 persons present, representing 75 calls and 48 mobile installations. Those who attended were W7s BFA, DJH, DRQ, EAW, HGI, HYQ, JKY, KAD, KAE, KCB, KOF, KOY, KUJ, KWB, KXT, LEE, LJJ, LSK, LXX, MAE, MDD, MBS, MWQ, NAP, NEL, NTK, NUL, NYN, OAS, OIF, OPY, OQS, OUE, PAC, PIY, PMQ, PZ, QHD, QWI, RFE, RIJ, SIP, SNI, SX, TJT, TLY, TNY, TPL, UBT, UCA, UDI, UPQ, USM, UXK, UXZ, VKO, VXX, WKM, WNN, WUX, WYY, YFG, YLR, W5s BQU, MTO, W6s DFL, EAL, EL, EWW, EXB, IZS, PIB, W9ANA, W0UEN, and VE3DVO. We regret to announce the passing on May 29th of JFG, Nap Trembley, of Tucson who was professor of French at the University of Arizona. WUG made BPL with 154 originated messages. LVR received his Maritime Mobile certificate. The Ft. Huachuca ARC's hamfest plans are complete for Sept. 3-4-5. 4CMC

# New MORROW Receiver

## COMING SOON!

The NEW MORROW MB-560 MOBILE TRANSMITTER designed to match the NEW MORROW MBR-5 MOBILE RECEIVER. 5 bands—VFO—60 Watts. Modern compact design. 4 inches high x 11 $\frac{3}{4}$  inches long x 6 $\frac{1}{2}$  inches deep. SEE IT IN QST NEXT MONTH!

Now MORROW engineers have teamed up to bring amateurs a superb new mobile receiver, the MBR-5. The MBR-5 is a complete 13-tube dual conversion superheterodyne communications receiver built to afford greater versatility, easier installation and added operating convenience. All the fine workmanship and dependability of Morrow engineering and manufacturing processes are built-in in this new receiver to offer better performance and more value than anything offered to amateurs before. Compare MORROW specifications! SWITCH TO MORROW TODAY!

**HIGH SENSITIVITY**—Better than  $\frac{1}{2}$  microvolt sensitivity assures hearing practically any signal. This feature combined with excellent signal/noise ratio makes signals readable that are ordinarily lost.

**100 K.C. CRYSTAL CALIBRATOR**—Now, for the first time, MORROW has made it possible for amateurs to read exact frequency on mobile receivers. Assures high reset accuracy.

**SSB AND CW RECEPTION**—Excellent SSB and CW reception is assured due to the inherent stability of the MBR-5. No warm-up delay. Fully temperature and voltage compensated oscillators. Will hold calibration accuracy with changes of 0 to 150 degrees F. and input voltages of 4 to 8 volts, DC.

**ECONOMY PRICED**—\$224.50 complete with 6-12 volt DC power supply, MORROW SH type PM speaker, operating instructions and mounting hardware. Physical size: 4 inches high, x 11 $\frac{3}{4}$  inches long, x 6 $\frac{1}{2}$  inches deep. PW-115, for fixed station use: \$29.95.

**SQUELCH AND NOISE LIMITER**—The exclusive new MORROW Noise Balance Squelch completely eliminates interstation noise but will readily open on weakest signals. The improved series gate noise limiter is extremely effective in eliminating pulse noises.

**ILLUMINATED "S" METER**—Measures incoming signal strength and used as a field strength meter for adjusting mobile transmitters to maximum output. A must for mobile amateurs.

**NO SPURIOUS RESPONSE**—Excellent RF design eliminates images and spurious responses. Bothersome broadcast break-through and oscillator harmonics suppressed.

**HOME STATION OR ANY AUTO**—Power supply operates on both 6 and 12 volts. 120 volt AC power pack available for fixed station operation. Accessory socket on power pack to supply low voltage stages of the MORROW MB-560 Mobile transmitter.

**TUBE LINE-UP:** 6BZ6 RF—12AT7 mixer, osc.—6BJ6 IF—6BE6 mixer, crystal osc.—6BJ6 IF—6T8 det., BFO—6AL5 noise rect.—6AL5 noise limiter—12AX7 audio amp., squelch—6C4 audio amp.—6AQ5 audio output—6BJ6 crystal calib.—12AT7 noise amp., "S" meter.

Vancouver, B.C., Canada

# the NEW LOOK in BUD PRODUCTS and new sizes, too!

If you take pride in the appearance of your rig, get acquainted with the new look in Bud Products and the new sizes of some of our items.

## SLOPING PANEL CABINETS

Now Bud offers 4 new sizes in our Sloping Panel Cabinets. With 9 sizes now in this line, there is sure to be a size to fit your need. In addition, there are quality bonuses like the exclusive Bud hinged top providing easy access to components . . . and there's more — you can have light grey hammered finish at no extra cost.

## TELEPHONE TYPE RELAY RACKS

Four sizes of these sturdy racks are now available for your convenience instead of two sizes previously offered. Now all standard relay racks may be obtained in light grey hammered finish without extra charge.

The following Bud products are also available in light grey hammered finish:

**DESK TYPE RELAY RACKS**  
**METER CASES (Steel and Aluminum)**  
**METAL UTILITY CABINETS (Steel and Aluminum)**  
**CARRYING CASES (Steel and Aluminum)**

See these and other fine Bud products at your distributors. If your local distributor does not have these items in stock, send us his name and we'll see you are supplied immediately.

**BUD RADIO, Inc.**

says overnight camping facilities can be had at Garden Canyon, also there are motels; civilian planes can use the Army air strip if Army is released from responsibility. Traffic: (May) W7LRU 46, WUG 17, (Apr.) W7WUG 182.

**SAN DIEGO** — SCM, Don Stansifer, W6LRU — The big news of the month is the coming Southwestern Division Convention, sponsored by the San Diego Council of Clubs, on Sept. 30th, Oct. 1st, and Oct. 2nd. The officers of the Council are ODR, chairman; GBC, vice-chairman; SEC, secy.; and BPK, treas. WYA is chairman for the Convention. CRT has added 10 new countries recently, including VS6, YO, SM, KGI, OE, KC6, SP, VP4, PA, and Trieste. KN6LIR is a newcomer to Pt. Loma. OME, ex-TA3AA, is home again, and working DX with his kw. rig. New officers of the YLRL are: Mary Poe, pres.; Kathleen Kreysler, vice-pres.; Isabell McKenney, secy.; Billie MacDonald, treas. HIL has a new 75A-4. K6LKG now is living in Vista. KVB is mobile in his new Ford on 75 meters. HAW is mobile all bands and anticipating a trip to Iowa. HTN is angling for a Johnson KW rig. The Palomar Club has been reissued its old call, NWG, and used it during Field Day. K6AWW is now in Carlsbad. BZE and KSM are building new all-band finals. CHV and LRU were among the first 5 W6s who worked VS4CT when he started operating from Sarawak on 20-meter phone. CHV also worked him from Brunel. The local DX gang is very active again with improved conditions. LRU is now at 199 countries, with HK0AI, YJIDI, VS4CT, and ZD6BX. ODR and his XYL flew to England for a vacation in June. It is hoped that the entire gang will pitch in and make the coming Division Convention as successful as those in the past have been. SYA has a new twin-five beam on 144 Mc. Traffic: W6IAB 3257, YDK 825, IZG 262, K6DBG 44, W6FMZ 7, KVB 6.

**SANTA BARBARA** — SCM, William B. Farwell, W6QIW — Santa Barbara AREC is well organized and conducts c.d. drills on regular skeds. Our hats are off to Ventura and Oxnard AREC for their FB c.d. work, also. K6BVZ and W6FFF are on 6 meters. TMI has worked over 45 states on 6 meters. K6KXB now is General Class. BQP is rebuilding. PKC, IHD, ZRR, and QHC are on s.s.b. The mortality rate of Novices is only 3 per cent in this section. Code classes are conducted by the Santa Barbara, Ventura, and Oxnard Clubs. K6KPU and W6SRI check in regularly on ALN. ENR is mobile with a Viking Ranger. QIW, MSW, IGH, and ENR were among those attending the Pacific Division Convention at Fresno. The Tri-County Net, on 3820 kc. at high noon is very active. PQJ holds skeds with his son in college. ENR and NKT are very active OOs. State College hamis active on 3995 kc. are K6AYC, ALP, W6BIN, SLR, and EJO. Traffic: K6NBI 387, W6REF/6 89, QIW 70, K6KPU 6, W6FYW 4, K6ASB 3, W6DTY 2, ENR 2, SRI 2.

## WEST GULF DIVISION

**NORTHERN TEXAS** — SCM, T. Bruce Craig, W5JQD — SEC: RRM. PAMs: PAK and IWQ. RM's: PCN and QHI. The Midland Amateur Radio Club has been accepted as an ARRL affiliate. ACK is mobile with 12 watts. AHC is rebuilding his rig. HKF has moved to Brownfield, leaving an opening for EC in Seagraves. MBP reports for the Blue Ridge 160-meter Net, which held a picnic at Lake Lavin on Apr. 24th with 32 present. The Net meets on 1880 kc. at 0800 each Sun. with 86 per cent attendance for May. CZZ, DBE, DNZ, LVP, MBI, MBP, QFK, and GES have mobiles on 160 meters. LGY reports that she is on 40-meter phone and c.w., that HDM went to work for WFAA at Grapevine, and that AFY has a new daughter. WXY is president of the Texas YL Round-up Net; W5SYL, vice-pres.; LGY, secy.-treas.; ZPD, pub. chairman. APK is a new member of NTEN. FIR is putting up a new vertical on 75 meters. The Temple Amateur Radio Club was alerted and assembled at the Police Station on a stand-by basis on May 6th at 1819 hours after a tornado wind demolished a part of the city. The amateurs furnished the power units used at the scene of the disaster until relieved by the National Guard. Stations participating were VIF, SBS, CHF, JIB, WDW, PNP, UPO, VHF, DXD, and numerous other fixed stations as well as some of the XYLS. Fort Worth hamis were guests of the Southwestern Bell Telephone Co. on Apr. 21st for a tour of the exchange office. ONQ has code classes going; he operates on 40 meters because of difficulty in antenna length. Traffic: K5FFB 2052, W5DTA/5 999, KPB 523, FJB 298, UBW 156, AHC 149, PAK 127, ACK 81, PCN 54, CF 50, FCX 27, ASA 16, LGY 10, HKF 8.

**OKLAHOMA** — SCM, Dr. Will G. Crandall, W5RST — Asst. SCM: Ewing Canady, 5GIQ. SEC: KY. RM: GVS. PAMs: PML, SVR, and ROZ. The most notable event of the month was the North Fork Hamfest at Quartz Mountain State Park. West Gulf Division Director CF gave a fine talk and enjoyed himself. He won over RST as the oldest ham present. BIE was not satisfied with climbing roofs daily putting up TV aerals but had to climb the mountain with the kids. Sorry to report that the change in the license plate law did not pass as it started too late and got lost in the shuffle in the closing days of the session. Amateur radio again demonstrated its readiness to serve in an emergency when a tornado hit Blackwell. The tornado warning net had been following the squall line from Southwest Oklahoma

20 meter coil	<b>6.81</b>

Model 73-E

## STEWART WARNER Portafone

Citizens 2-Way Radio

A lightweight, self-contained radio receiver and transmitter. Has a transmitting and receiving range from several hundred yards to several miles, depending upon terrain. The perfect communication system for the construction engineer, the surveyor, the TV service technician, and the many others in the need of inexpensive means for short range communication.

Portafone weighs only 28 ounces and fits comfortably into the hand. Power is obtained from either battery or AC supplies. One Battery or Power Pack is required for each Portafone unit.

Portafone Model 73-B, per unit, including antenna and carrying case (less battery or power pack) **\$12995**

Add Fed. Excise Tax **3.50**

Handy Battery Pack for portable use **6.45**

Central Station Power Pack for 115 V. AC **34.65**

6 and 12 volt DC Power Packs (specify 6 or 12 volts) each **31.00**

## The AMERICAN RADIO RELAY LEAGUE, Inc.

WEST HARTFORD 7 • CONN.

for several hours with several funnels sighted and many communities alerted. Luckily HFV's QTH was not hit and power was still on so help was on the way in short order. EC LWJ was in Tulsa but got over the next a.m. with emergency gear and handled many messages, most of which were welfare. Others in there soon were GIQ, MFX, 9PHR, and CXM, who spent many hours helping with the traffic. Traffic: (May) W5GVS 410, IWJ 220, LX 156, PML 96, MFX 73, SVR 70, QAC 61, KY 58, PNG 56, FEC 44, JXM 38, RST 38, CBY 34, HCG 33, TNW 33, ADC 31, FU 19, CXM 18, MQI 17, MCG 14, CFG 13, UCT 12, GXH 11, CYQ 10, EHC 10, PAA 7, TKC 4.

**SOUTHERN TEXAS** — SCM, Morley Bartholomew, W5QDX — Members and guests of the South Texas Emergency Net met at Kerrville May 27-29 for their tenth annual convention. General chairman BEO and all the Kerrville gang really put on a swell show. New Net officers are CWS, nc; RKL, alt, nc; LRK, secy-treas.; JHW, pro, Zone 1: EV, ze; ONG and TVK, alt, ze; MSA, pro, Zone 2: RWS, ze; WYK, alt, ze; AUM, pro, Zone 3: EJT, ze; WXT and DKK, alt, ze; WIS, pro, Zone 4: AUO, ze; NZH and CRA, alt, ze; SZB, pro, Zone 5: SJL, ze. The C.W. Net is headed by FIW, nc; MJN, alt, nc; EV, NSA, TEL, QKF, QEM, and LMU were seen greeting old friends at the convention. The Red Cross at Mission held a simulated disaster on March 6th. Valley amateurs who participated were PBD, base station, FZO, SZB, PBU, NZH, AUO, PAR, LKJ, AET, NVQ, TVL, ASI, DNX/5, and K5NCJ. The Rio Grande ARC has started code classes. YRI has moved to Donna and has a new Globe King. BVZ and BWT are on 75 meters. The CCARC furnished communications for the Padre Island Walkathon, the 110-mile contest from Pt. Isabel to Corpus Christi. Everyone got lots of experience in message-handling. AQK, HQR, and PMT spent three nights on the Island with the walkers, and all club members worked shifts at the Corpus Christi end to get the messazs through. The Club also furnished communications for the Buccaneer Day Celebration. The Austin Naval Reserve Unit is starting code and theory classes for beginners. PRO is operating portable from Rockdale this summer. Traffic: (May) W5MIN 381, TFF 34, (Apr.) W5TFY 62.

**NEW MEXICO** — SCM, Einar H. Morterud, W5FPB — SEC: KCW, PAM: BIW, V.H.F. PAM: FPB. The NMPEX meets on 3838 kc, Tue and Thurs, at 1800 MST, Sun, at 0730, the NM Breakfast Club every morning except Sun, 0700-0830 MST on 3838 kc; the NM C.W. Net daily at 1900 MST on 3633 kc. We regret to announce that GYN has joined Silent Keys. New officers of the Pecos Valley Radio Club are ZU, pres.; ARD, vice-pres.; DZB, secy-treas.; COS, act. mgr. The Albuquerque V.H.F.-U.H.F. Radio Club has been organized with the following officers: FAG, pres.; VWU, vice-pres.; FJE, secy-treas.; ECS, act. mgr. The Club has been holding drills with c.d. message center personnel. CEE is the new State MARS Director. CZT has a Gonsel Communicator II. QHB is on 2 meters from Los Alamos. The following furnished communications for the auto races held at Fort Sumner: KN5AOS, W5CZT, FVY, CXU, JAU, LEF, NSN, OAI, PDY, PKL, UAF, UCN, UWA, and VDY. The Navy has called UEO to sea duty. A total of 203 registered at the State Hamfest held in Albuquerque sponsored by the Amateur Radio Caravan Club. John Reinartz, K6BJ, was speaker. The pre-registration prize, a complete mobile station, was won by W5WFR; registration prize, an SX-99, was won by W5KNU; K5WSP and K5PEF made BPL in May. Traffic: K5WSP 1222, FEF 351, W5RFF 131, QR 18, ZU 18, BZZ 16, JZT 13, UAR 7, HOE 4.

### CANADIAN DIVISION

**MARITIME** — SCM, Douglas C. Johnson, VE1OM — Asst. SCMs: Fritz A. Webb, 1DB; Aaron D. Solomon, 1OC. SEC: RR. New appointees are AEB as OPS, AAY as ORS and OPS, and QZ as OES. JT is active from Grand Manan. Joe is ex-VE2ANR. BN and W3TWO/VO1 were recent visitors to Halifax. W4STY/VE1 is active from Shelburne. Hats off to those amateurs who monitored 75 meters, and were well-prepared for any eventuality during the recent bad outbreak of forest fires. WB, NBARA president, reports two successful c.d. exercises in which N.B. hams took part. Apparently civic officials of Fredericton were very impressed. Mobiles VO1T, AE, B, AO, 2I, W9WIA, W4WOU, and W0MTZ participated in the Cancer Drive canvass. VO1AB was control station. The recent hidden transmitter hunt was won by mobile VO1AE. Others taking part were W4WOU and VO1s T, AO, B, and AB. VO1D/2 was the hidden transmitter call. The Newfoundland Radio Club executives are VO1AO, pres.; W0CZK, vice-pres.; W5RPI, treas.; VO1D, reflected secy. W7SNR/VO6 reports a posting to K1H6-Land. VO6AM, the XYL of VO6U, is a new ham in Goose. Ex-W4KVM/VO6 is now K6LIB in Greenland. VO6AB is active on 20- and 75-meter 'phone. VO6U has worked 124 countries to date. Traffic: (May) VE1FQ 85, VO6B 146, VO6AH 96, VO6U 81, VE1AV 49, OC 47, DW 13, UT 40, VO6AM 15, VO1D 12, VE1OM 10, AEB 9, VO1T 8, VE1GA 7, DB 2, ABZ 1, WB 1, WK 1. (Apr.) VE1WK 6.

**ONTARIO** — SCM, G. Eric Farquhar, VE3IA — We record with regret two Silent Keys. Grant Salla, an ardent

# A Paying Proposition!

Maintenance of commercial mobile-  
radio installations is big business...  
still growing fast... pays good money  
... and regularly!

*It's a natural for hams!*

**HERE ARE THE TEST INSTRUMENTS  
PREFERRED BY EXPERIENCED ENGINEERS:**

**LAMPKIN 105-B MICROMETER  
FREQUENCY METER**

Heterodyne type. Range  
0.1 to 500 MC., all channels.  
Pinpoint VHF CW  
signal source. Weight 13  
lbs. Width 13". Price  
\$220.00 net.

**LAMPKIN 205-A  
FM MODULATION METER**

Measures FM voice deviation,  
±25 KC. Tunes 25-  
500 MC. in one band.  
Speaker. Oscilloscope out-  
put. Weight 13 lbs. Width  
12". Price \$240.00 net.

Both instruments meet FCC mobile specs...  
are easy-to-carry... but rugged and accurate.

You can build your radio knowledge  
into a profitable business, full- or  
spare-time! How? ... ask for booklet  
"How to Make Money in Mobile-Radio  
Maintenance". No charge ... Act Now!

Mfg. Division  
BRADENTON, FLORIDA

SWL of Nortown Club, Toronto, was killed in a motorcycle accident and Bob Hare, VE3CRH, was killed in a bicycle accident near Smith Falls. The latter did much valuable work during the past two winters as a member of the St. John Ambulance Ski Patrol in Ottawa. Deepest sympathy is extended to both families and the Nortown and Ottawa radio clubs. On the loss of his mother we also offer our condolences to BNQ, of Hamilton, DTO is Class A. Two members of Nortown were recognized for splendid showings in the last Sweepstakes. DRD won the Captain Morgan Trophy for c.w. operation and BVI the Albert Bickerton Cup for "phone. AOE is rebuilding. ATR is greatly missed in traffic circles and the gang is pulling for Reub in the hopes of improved health. AJR reports a fine time at the Oshawa Banquet. The Roblin Amateur Radio Club of Toronto is a recent ARRL affiliated club. New officers of the Ottawa Club are BCU, pres.; CMW, vice-pres.; AXL, secy. CCO is heard on 50 Mc. AYE, formerly G3AAU, is heard on 14 Mc. BMH, a newcomer, is welcomed. DWG, in Brussels, Ontario, sends in his first traffic count. Traffic: VE3BUR 238, VZ 153, CI 132, AJR 121, KM 101, NG 79, TM 76, NO 49, AUU 47, DWG 40, PH 14, VD 2.

**QUEBEC**—SCM, Gordon A. Lynn, VE2GL—AII, has a Lettine 240 with an S-40A receiver on all bands from Iberville. AVZ is a YL newcomer at Victoriaville. PV experiments with the radio control of miniature boats. ZI has changed QTH to Cap de la Madeleine. AND keeps LaTuque on the air. EC continues his skeds and handles considerable traffic: The new c.w. slow-speed net on 3710 kc. operates Fri. at 1900 EDT. AEV now is mobile on 75 meters. Congrats to ABS on his marriage May 21st. ACP is changing his QTH to Ottawa. ADD is Asst. EC for Amos. ATT is the new publicity manager of the South Shore Amateur Radio Club. The McGill Radio Club has had a good year with the club station, UN, with ACK as president. The new officers are SC, pres.; LS, vice-pres.; AQL, treas.; and AIY, secy. LS is summer relief operator at a TV transmitter station and is using a new mobile rig. AQL has moved to Chambly. SC is at a 50-kc. broadcast station for the summer and is building a DSRC rig using a pair of 304THs. AUU is sold on 4-wave ground-plane antennas. PQN has reduced sked to Mon., Wed., and Fri. for the summer months. ASU is an excellent c.w. operator although still in high school. Traffic: (May) VE2DR 102, EC 30, ATC 26, FL 9, GL 7. (Apr.) VE2DR 112, II 66, EC 39, ATC 14, FL 11.

**ALBERTA**—SCM, Sydney T. Jones, VE6MJ—PAM: OD, RM: XG. The Lethbridge and Coaldale amateurs did a fine job in keeping communications open recently when heavy wet snow knocked out telephone lines. The Coaldale end was handled by AM, TS, CK, VH, and HF, and the Lethbridge end by DY, OF, TG, OS, and VJ. HM is away on a trip to Eastern Canada. NX really is working the DX on 14 Mc. MJ made a trip to VE5-Land and visited the gang at CBK Watrous. AL is QRL working on a new 813 rig. WC is rebuilding to eliminate the TVI. We are sorry to report that ZR has departed for VE2-Land. Good luck, Ernie and Barbara. Traffic: VE6AM 144, HM 122, OD 38, WC 18, YE 16, AL 13, MJ 5, IZ 4.

**BRITISH COLUMBIA**—SCM, Peter M. McIntyre, VE7JT—Sorry to report the passing of ZZ, one of the original hams in Vancouver and also one of the original signers of the charter of the British Columbia Amateur Radio Association. AAJ reports that on May 29th amateurs in the Okanagan took part in a civil defense exercise. Those known to have taken part were AAJ, EQ, FS, and QC. XY, at Dawson Creek, is bewailing the fact that band conditions are poor. AUF, Lois, of Spring Island, has been appointed EC of District #2 of Vancouver Island. Congrats to the Royal City Amateur Radio Assn. on becoming an ARRL affiliated club. US suggests that 3755 kc. not be used for long ragchew QSOs but be kept as a listening-out frequency, which I believe was the original intention of 3755 kc. as well as being the net frequency. Make your initial call on 3755 kc. and if you make a contact, if you are a fixed home station, QSY up or down, which will leave the frequency clear for another call and especially for the mobiles. But don't forget to listen once in awhile on 3755 kc. Another bad habit I have noticed is that someone gives a piece of traffic for relay during the net and all and sundry who have heard the traffic pre-net time get in the act and pass that traffic. Don't do it, let the person who received it pass it as he was asked to do by the originator. There will be no column next month as I will be away on vacation in W9-Land, I hope. Traffic: VE7QC 218, ASR 71, AUF 49, JT 19, ZV 18, ZF 12, FS 11, AIO 9.

## Antenna Bridge

(Continued from page 15)

capacitor 30 to 50 times larger than the total tuning capacitance to counteract it. So a 0.002- $\mu$ f. capacitor was placed in series with the single-ended output terminal (stud of the coax connector) and the end terminal of the coil. Then the two binding posts were shorted with a piece of straight, round wire and the coax connector was plugged into a shorted female connector. The grid-dipper then showed resonance at 12.3 Mc. This indicated that the capacitor was about 30 per cent larger than it should have been so it was replaced with .0015  $\mu$ f. (1000  $\mu$ f. and 470  $\mu$ f. in parallel shown in the photograph). A grid-dip check with both input and output shorted then showed resonance at 14.6 Mc., again amply close.

The same balun turned out to require 4  $\mu$ f. (plus the 8  $\mu$ f. distributed) for shunt tuning at 28 Mc. and the series capacitor was 420  $\mu$ f. A 10 per cent error in the value of either of these capacitors is relatively unimportant. With the values indicated for 14.3 Mc., errors caused by the balun itself were so small as to be unreadable when used with a bridge such as the one described in this article (well below 1 per cent if the 50,000-ohm shunt-coil losses were used to determine a correction factor).

Omission of the leakage-reactance correction capacitor made quite a sizable error when measuring loads of 100 ohms or less at 28 Mc. Inclusion of the capacitor reduced these to less than 2 per cent for any value.

As mentioned previously, the 1000  $\mu$ f. and 470  $\mu$ f. forming the 0.00147- $\mu$ f. series capacitor for 20-meter operation are shown in the illustration between the outer terminal of the winding and the center stud of the connector. Either tuning capacitor (4  $\mu$ f. for 10 meters or 39  $\mu$ f. for 20 meters) can be connected externally across the binding posts.

When using the balun for 10 meters, the 1000- $\mu$ f. portion of the series capacitor is opened.

In conjunction with the bridge, the balun described can be used over a  $\pm 500$ -kc. range on 20 meters and  $\pm 1$  Mc. on 10 meters, without retuning.

### Conclusion

The simple antenna bridge described here can be used for almost any type of r.f. impedance measurement that the amateur is called upon to make. The possibilities in this regard have only been touched upon in this article, but the many applications have been well covered in amateur literature. There is only one warning—do not, under any circumstances, leave the bridge in the circuit while the transmitter is in use. The bridge is a measuring instrument, not a device for monitoring the performance of the transmitter.

# SHAFT COUPLINGS

Building it yourself? Then use JOHNSON couplings. Capable of many thousands of operating cycles without failure due to fatigue—manufactured with high quality, low loss insulation. All metal parts accurately machined and suitably finished. Phosphor bronze springs on the -250 and -251 series shaft couplings provide flexibility without backlash and adjust to minor shaft misalignments. Rigid types such as the -250 and -262 will meet requirements of accurate shaft alignment and high torque. The -259 is a bar type shaft coupling recommended for high voltages or very high frequencies—the -264 is a small bakelite insulated shaft coupling for DC or low voltage RF applications.

**FLEXIBLE SHAFTS**—Perfect for out-of-line or up to 90 degree angular control—phosphor bronze, non-rusting flexible shafts with 1/4" nickel plated brass hubs.

**PANEL BEARING ASSEMBLIES**—Panel bearings for 1/4" shafts and rigid 3" and 6" nickel plated brass shafts assembled in panel bearings. Shafts are 1/4"; bearings, furnished complete with 3/8" -24 nut, can be mounted on panels up to 3/8" thick. Special shaft lengths and locking type bearing assemblies available on special order.

## 807s in Parallel

(Continued from page 20)

the 750-volt 100-ma. condition. In this case, with maximum inductance in use, the  $Q$  will run around 17 or 18. Also, the values of input capacitance shown in the table include tube output capacitance and other stray capacitances, so that input capacitances of less than about 50  $\mu\text{f.}$  will probably be unattainable. Where the

The amplifier is enclosed in an inverted aluminum chassis in which the bottom plate serves as the top cover. Along the rear edge are the output coax connector, ground post, tip jacks for heater, screen and plate voltages, and r.f. input jack.

table shows less than 50  $\mu\text{f.}$  input capacitance,  $C_4$  should be operated as close to minimum capacitance as practicable.

An exciter should be connected to  $J_1$ , and the coupling adjusted to give about 7 ma. of amplifier grid current. With a 50-ohm load connected to the output, the input and output capacitances should be set as closely as possible to the values indicated in the table, and the variable inductor should be adjusted for resonance as indicated by the customary dip in plate current. Decreasing the output capacitance or the inductance (or both) while maintaining resonance with the input capacitor should increase loading. Adjustment in the opposite direction should decrease the loading.

## "Little Gem"

(Continued from page 17)

of the dial settings at different frequencies can be made and placed on the back cover plate of the box, and the instrument used as an indicating wavemeter. The chart can be calibrated by the use of a grid-dip meter or VFO. It might be well to remember that the calibration (when used as a wavemeter) will change slightly if an external antenna is used. When microampere measurements are being made, test leads are plugged into the pin jacks and the meter is used like any standard microammeter. Care should be taken not to use the instrument in circuits where the current will deflect the meter over full scale. The amount of amplification that the transistor will have depends on the par-

...AND MAKE GOOD QSO USE OF YOUR DRIVING HOURS!

**HARRISON HAS IT!**

## MULTI-ELMAC EQUIPMENT

to give you more fun per mile!

AF-67

Has all the features that give you greater operating results!

- VFO, and spotting switch! Enables your zeroing-in to a net frequency, a CQ, or into a clear spot, without QRMing anyone. A "must" in the crowded bands.
- Single knob bandwidth! No matter the time, nor location, you can quickly and easily jump to the band that will give you the solid local or DX QSO's you want. (Seven bands, 160 thru 10 meters.)
- Power! A respectable 40 to 50 watts OUTPUT, with good "sock" audio, keeps your signal right up there with the best of the KW's.
- PLUS—just about everything else you could desire in a modern, highly efficient, well constructed, compact (11 1/2" wide x 7" high x 8 1/2" deep), VFO transmitter for mobile, field, or fixed station stand-by or KW exciter.
- AF-67, complete with tubes, quick-disconnect power plug, for 6/12 volt systems, and full installation and operating instructions. **\$177.00**

### THREE— for the price of ONE!

Slip the PMR-6A Receiver and the AF-67 Transmitter out of the car, and just by plugging in these AC operated power supplies you have a complete, compact, home and portable field station, or VFO exciter for KW final! Triple duty, ready for any service or emergency.

PSR-116S

115 Volt AC supply for complete operation of 6 or 12 volt model Receiver. With cable and plug.

Same, but with S meter.

PSR-116 — \$24.50

PSR-116S — \$35.50

Dual output supply for full power operation of the AF-67 Transmitter. Complete with cable and plug to match transmitter, and internal push-to-talk control. **\$56.25**

Coaxial antenna change-over relay with 115 Volt AC coil. **\$9.25**

### Of course—

Harrison has all of the good makes of Ham equipment!

Just order, or ask for literature and our low prices.

PS2V

### SAFETY FIRST!

Keep both hands on the wheel, and your eyes on the road!

1. Use a Turner "Third Hand" to hold the mike in front of your lips. (\$2.94). Light-weight yoke slips around neck. Special Shure controlled reluctance hand microphone, quickly screws on or off "Third Hand". **\$8.82**
2. Put a "Foot-to-talk" switch in the floor-board, and connect across push-to-talk control wires. **\$1.89**
3. Mount the receiver where you can tune and see the dial without looking away from the road.

Idle time at the wheel, on business or pleasure trips, or just driving back and forth to work, is the perfect time for the busy man to get in his hamming.

Let me help you get the right equipment and everything needed to complete a top performing installation that will give you plenty of pleasurable QSO's.

ticular transistor used. The transistor in this unit was found to have a current gain of 20, or 26 db., so that full-scale deflection on the 0-1-ma. meter was 50  $\mu$ a. To calibrate the meter for microammeter measurements, a simple calibration circuit can be set up using a dry cell and several known resistances. A diagram of the circuit is shown in Fig. 2. Currents that will flow in the circuit with given resistances are also shown. By the use of

Fig. 2—Microammeter-calibration circuit using known resistances and voltage. By using a 1.5-volt cell and known resistances  $R$ , current  $I$  will flow in the circuit. Naturally, the closer tolerance resistors will give more precise calibrations.

$R$ (ohms)	$I$ ( $\mu$ a.)
150,000	10
68,000	22
47,000	32
33,000	45
18,000	83
15,000	100

Ohm's Law any current flow through the circuit can be calculated if the resistance and voltage are known. By plugging in a pair of headphones and setting the function switch on field strength meter, the quality of a 'phone signal may be observed. The transistor is acting as an amplifier in this position, so the gain will be more than enough for strong headphone volume. This feature will be appreciated when monitoring a mobile 'phone signal, where the signal strength is low.

The basic movement of the meter in this instrument may be used by switching the function switch to milliammeter. Leads are connected to the pin jacks and the instrument is used accordingly. External shunts may be used with the basic 0-1 ma. movement to provide an extremely wide range of current measurement.

A PNP junction transistor was used in this unit. However, a NPN type may be used if the cell, meter, and tip-jack leads are reversed.

## Power and Meter Facts

(Continued from page 25)

will do.) Next, I adjust the coupling of the feed-line to the final. The coupling is set for maximum power output at a given plate current at resonance. If the coupling is increased, the d.c. plate current goes up, but the output either remains constant or decreases. This point of maximum output for a given amount of input comes close to the magic point of proper adjustment for all linear amplifiers. The old method of loading by reference to "dip at resonance" is not recommended. Once we have reached the suggested adjustment, we have had it as far as coupling goes. If the d.c. current is less than 300 ma. (for the amplifier under discussion), we simply don't have enough linear drive.

Now, regardless of the power I believe my amplifier should handle, I make a crude check to determine at what point it actually flattens. I vary the amount of carrier insertion, watching mainly the output indication, and note the point at which increasing the carrier no longer results in a rapid increase in output. I now observe the plate meter reading, hoping in this case that it is up to 300 ma. I use this figure to multiply by plate voltage. This is roughly my maximum-signal linear power available. Suppose my linear drive available limits my actual plate current to 250 ma. My maximum signal power is then only 375 watts instead of the possible 450.

Next, I remove the carrier. I change to voice. This is the point where experience in using a 'scope counts. I know that my voice, using the average plate meter, will deflect the meter only about half as far, for the same maximum signal power, as the carrier did. Thus, since my steady signal current was 250 ma., I wouldn't expect much over 125 ma. on normal talking. The only way to achieve more meter swing under this set of amplifier conditions and not splatter would be to use properly designed and adjusted compression in the exciter's audio.

Reviewing the preceding material, you can determine that my "meter peak, on voice" or legal power, is only 187 watts (125 ma.  $\times$  1500 volts). My maximum signal or peak envelope power is 375 watts (250 ma.  $\times$  1500 volts). The instantaneous peak power is about 750 watts. As the saying goes, "You pays your money and takes your choice."

Actually, your voice might be able to swing the meter somewhat more than mine for the same amount of maximum signal power. If I were using a Class AB amplifier I would expect the meter to swing somewhat higher on voice in relation to its reading on steady signal.

Don't think that I am recommending the above procedure as a replacement for legitimate "two tone" adjustment with a 'scope. Anyone who has worked with linear amplifiers knows that inserting large amounts of steady signal (carrier or single tone is worse; "two tone" less punishing) has the rather disconcerting and costly tendency

(Continued on page 118)

*"Worked 87 foreign countries, all continents and 30 zones" with a Gotham Antenna and 35 watts.*

## READ THIS AMAZING LETTER: How an inexpensive **FULL SIZE** Gotham Rotary Beam made it possible to "work the world!"

Gotham Hobby Corp.  
107 East 126th St.  
New York 35, N. Y.  
Gentlemen:

Florida, 13 May 1955

I'd like to express my enthusiasm and satisfaction regarding your 20-meter rotary beam antenna. I purchased one of your standard two-element units in February of this year. Prior to this time I had been using a collinear array about one wavelength above ground. The transmitter feeding this antenna had a power output of about 35 watts, and results were quite discouraging.

When my Gotham arrived, it was easily assembled in a couple hours. The same transmitter was used to excite the Gotham antenna, using the same power as before. Results have been quite gratifying, and it is interesting to note that in the three months since using the Gotham antenna, I have worked 87 foreign countries, all continents, and 30 zones.

I am able to keep schedule with amateur radio —\* in the Cape Verde Islands every week. *It was impossible to even hear this station before using the Gotham beam.*

Extremely high winds are prevalent in this part of Florida. The Gotham beam has withstood blows in excess of 50 miles an hour without failure.

The elements bend almost double in these high winds, but readily return to their original configuration when the wind abates. I feel that this is an extremely important feature of the Gotham antenna.

I have enthusiastically recommended Gotham to all the hams who ask what type I am using (and most of them do, when I tell them the amount of power I'm using). I wish you every success with your product, and feel that it is well worth the modest price.

Yours very truly,

(Names and \*call letters upon request.)

### EVERY FULL-SIZE GOTHAM ROTARY BEAM IS ENGINEERED FOR SIMPLICITY, STRENGTH, PERFORMANCE

Your Gotham comes to you completely fabricated, made (except for the polystyrene insulator) entirely of new, rustless, first-quality mill stock aluminum. You'll find no link coupling, no complicated mounts, no tuning stubs. You get good, solid aluminum tubing—and more of it, in both length and thickness (the only true gauge of \$ value)! No flimsy wire, no wood to rot or weather-proof.

Easy assembly, simple and quick matching of line to antenna. Yet Gotham's price is 25% to 75% lower than the "toy" midget beams which Gotham so easily out-performs.

THE DOW-KEY CO., Inc.  
WARREN, MINNESOTA

of making vacuum tubes melt. Discretion is always indicated when making adjustments. However, if cautiously used, the procedure is guaranteed to do one thing — to produce a signal vastly more neighborly than one generated in an all-out attempt to wrap the pointer around the pin.

While I have been writing, I have had a vague feeling of someone looking over my shoulder and wanting to say, "I always knew there was some reason why those 'sidebanders' sound so terrible and are so broad. Now I know. They are all 'meter benders'!"

Well, old man, I don't want to start an argument now, but remember the saying about people who live in glass houses. Just because "sidebanders" as a whole are "distortion conscious" it doesn't necessarily mean that they invented the stuff. Sideband enthusiasts with their s.s.b. receiver, transmitters, and voice-control operation, are actually achieving a worth-while increase in voice communication — per kilocycle per watt per hour. This would be impossible if the linear-amplifier situation was really "rotten."

This is not a plea for more than a small percentage of the present operators to become less meter happy. The purpose is to collect a few facts about the use of d.c. meters in voice circuits and to give some pointers concerning power calculations.

Almost everyone who first uses a linear amplifier in s.s.b. service thinks first of the power available. If things progress normally, a change occurs. At some point he starts adjusting for linearity and then accepts the power that results. When that happens, you know that he has graduated into a new and mature attitude toward our old friend Mr. D. C. Plate Milliammeter.

## One Tube

(Continued from page 28)

characteristic of practically all transmitters that an r.f. click will be generated by the opening and closing of the key. While this click may not travel far on the air, it can still be nasty enough to cause interference to neighboring broadcast and TV sets as well as the operator's own receiver. It is a simple matter to get rid of the click, and two capacitors and r.f. chokes will do the job. The important thing about using a filter is that it be mounted right at the key.

For testing purposes, a dummy antenna should be connected to the output terminal. Use a 40- or 60-watt electric lamp for the dummy load. The key plug is inserted in its jack and the key is left open. With the 115-volt line connected to the rig,  $S_1$  is turned on and the 6X5 filaments are allowed to warm up for a minute or so. Then  $S_2$  is turned on and the 5Y3 allowed to warm up for another few minutes. The power supply is switched to the low-voltage output. The key is then closed and the plate capacitor tuned for resonance as indicated by minimum brilliance in

## SAVE HOURS OF WORK

### quickly make round, square, key and "D" openings with Greenlee Radio Chassis Punches

In 1½ minutes or less you can make a smooth, accurate hole in metal, bakelite or hard rubber with a GREENLEE Punch. Easy to operate... simply turn with an ordinary wrench. Wide range of sizes. Write for details. Greenlee Tool Co., 1868 Columbia Ave., Rockford, Ill.

the plate dial lamp. The dummy lamp should also light up at this point. Don't expect the lamp to be at full brilliance. While lamp bulbs make a convenient dummy antenna, they don't always match the output characteristics of a transmitter and consequently won't load the transmitter fully.

For 40-meter operation, a 40-meter crystal should be inserted in the crystal socket and  $S_4$  switched to short out the unused portion of the plate coil. Tune-up procedure is the same as on 80 meters.

It is possible to use an 80-meter crystal and double in the plate circuit for 40-meter operation. However, for maximum efficiency, it is best to have crystals of frequencies that fall in the band in use.

To put the rig on the air, it is imperative that an antenna coupler be used. The unit described here was given extensive on-the-air tests. The antenna coupler used was the one described by the writer in *QST* for April, 1955. The antenna was 135 feet long, center-fed with open-wire TV line. Over 70 contacts in 30 states were made in a 4-day session.

In constructing, testing, and using this transmitter or any transmitter for that matter, the beginner should always exercise extreme caution in dealing with electric power. Be sure and check that all voltages are off before touching any of the components below deck and in the shield box

## Buffalo RACES

(Continued from page 44)

rigs capable of being removed and operated on either 110 v. a.c. or 6 v. d.c. They use 19-inch vertical whips.

The Aid Check Points are located around the perimeter of the heavily-populated areas. These RACES stations utilize a unit with 17 watts output to a ground-plane antenna.

Each of the fifteen large townships in Erie County has what is called a Report Center. Each Report Center has a complete RACES radio station to relay traffic from the local area directors to the main Control Center. These stations at the Report Centers utilize 100-watt transmitters feeding a beam antenna centered on the Control Center in Lancaster, N. Y. All antennas are vertically polarized for compatibility.

All installations are completely independent of commercial mains by virtue of having a gasoline-driven a.c. generator available delivering from 2 to 5 kilowatts, depending upon requirements.

Many of you reading this article will probably ask where do the personnel to operate a communications system of this size come from. When General E. G. Ziegler, the County Director of Civil Defense, originally outlined his requirements for RACES communications, we knew that only with complete cooperation from the local

# Why take less for that trade?

you'll do better when you deal at Burghardt's!

**10% Down—Easy Terms**  
—10% down lets you "take it away." Up to 18 months to pay on balances over \$200. Burghardt's financing saves you money—adjusts terms to your budget. All time payments based on local bank rates. Full payment within 90 days cancels interest.

**Speedy Delivery—Personal Attention**—No order too large or small for personal attention. All inquiries acknowledged and orders processed day received.

**Satisfaction Guaranteed**  
or your money refunded  
after 10 day trial.

## CONSET SUPER SIX CONVERTER

An outstanding six-band amateur mobile converter. Covers 75, 40, 20, 15, and 11-10 meters. Also has 19 and 49 meter BC band coverage for casual listening. Very high sensitivity using an 8 ft. whip. **ONLY \$5.25 DOWN**  
\$4.17 per month for 12 months

**CONSET NOISE CLIPPER**—standby of a great many mobile operators. Greatly reduces ignition and similar types of interference. Easily installed on any receiver, fixed or mobile, with conventional diode second detector circuits. **ONLY \$9.25**

## B & W SINGLE SIDEBAND GENERATOR AND THE NEW 5100S TRANSMITTER

What a combination! Teamed up with the new 5100S transmitter, this B & W Single Sideband Generator gives you outstanding SSB operation on all the frequencies provided in the 5100S. Tuning and operation is a breeze — no test equipment required. Completely self-contained, the 51SB requires no external accessories other than a microphone. The 5100S gives you 150 watts input on SSB and CW, 130 watts on AM phone. Other features include: VFO or crystal operation and a pi-network final. The 51 SB cabinet bolts directly onto the 5100S cabinet, extending the 22" length to 32". Easy to install, the 51SB comes factory wired and tested, complete with all tubes and necessary hardware.

## CONSET SUPER-CEIVER

Used in conjunction with any quality amateur converter, the compact SUPER-CEIVER provides mobile performance comparable to that of a high quality fixed-station unit. Performance is outstanding on both phone and CW — unit is crystal controlled for maximum stability. Eight tuned circuits at 262 kc provides high selectivity. Self-contained vibrator power supply furnishes voltage regulated power to the converter and to the BFO. Latter is highly stable with adjustable pitch control. Separate RF and AF gain controls and adjustable squelch. Highly effective noise clipper—unit has internal speaker—connections provided for external speaker, if desired. Easily converted to 12 Volts. **ONLY \$11.95 DOWN** (Price does not include converter)  
\$6.51 per month for 18 months

**B & W 5100S and 51SB**—Completely bandswitching on 80, 40, 20, 15 and 11-10 meters. With back wave diminution and excellent keying and break-in. **ONLY \$74.70 DOWN.**

**B & W 5100S** **ONLY \$46.75 DOWN**

**B & W 51SB** **ONLY \$27.95 DOWN**

## B & W SINGLE SIDEBAND RECEIVING ADAPTER

Now—convert your present receiver for: True single-signal reception on CW—Selective sideband reception on AM—Superb performance on SSB. May be used with any receiver having an intermediate frequency between 450 and 500 kc. "Gating control" permits tuning over a narrow frequency range without disturbing main receiver tuning.

Easy to install and adjust, unit is entirely self-contained in an attractive cabinet complete with power supply and a 7" dynamic speaker.

Price Soon to be Announced

## TOP TRADE-INS!

Write for our latest bulletin. We have hundreds of standard brand pieces of equipment in our trade-in department—used equipment made by Johnson, National, Collins, Hallcrafters, Gonset, Elmac, Harvey-Wells, Morrow, Central Electronics, and other leading names.

Our prices on trade-ins are realistic and down to earth. In addition where purchase is for cash with no trade-in, an additional 10% discount is allowed. Burghardt's financing plan tailored to your budget can be used for the purchase of new as well as used equipment.

There are fifteen township report centers, each requiring communications. This is the Elma Township station. The operator is K2DJN.

amateur radio operators would the success of this program be insured. Today, two years later, it can honestly be said that the local amateur radio operators in Erie County have more than justified the faith the Erie County Board of Supervisors put in them when they authorized the expenditure of \$57,000 for the equipment to outfit all of the RACES installations in the county. We have a total of 167 licensed amateur radio operators enrolled in civil defense and cleared in accordance with RACES regulations. There are more amateurs signing up each day and it is hoped that eventually every amateur in Erie County will be actively participating in the RACES program

## Operation Cue

(Continued from page 47)

during the Operation Cue program. It takes more than two weeks of concentrated study to absorb more than a smattering of information on atomic energy, but most of us observers felt we had in that two weeks picked up far more atomic energy information than the average person will get in his lifetime. It was an experience we'll never forget. And spectacular as it was, the explosion itself was only, as FCDA's Harold Goodwin put it, the attraction to get us out there to attend the briefings. The pre-shot and post-shot visits to the test area were as important as the witnessing of the shot itself, if not more so. ARRL was present, not only in the person of ourselves, but in the persons of the many other amateurs who attended and took part.

**EASY TO BUILD!**

Self Supporting  
**STEEL TOWERS**  
For Rotary Beams, FM, TV

You can erect this tower yourself. Just dig four holes, set anchor posts in place, bolt the pieces together. 3 1/2 ft. ladder sections make it easy to work higher as tower goes up. It's a lot of fun to build your own tower — and saves you money, too!

## Argonne TRANSISTOR TRANSFORMERS

AT LAST A COMPLETE LINE OF QUALITY TRANSFORMERS FOR EVERY TRANSISTOR APPLICATION AT A PRACTICAL PRICE!

**2.75** each  
Lots of 10 Assorted  
**2.95** Singly, each

Nickel-Steel and Silicon Steel Laminations. Wound on Nylon Bobbins in a Mylar Outer Wrap. Color Coded Leads. Have you been experimenting with transistor circuits? And have you been forced to make-do with compromise transformers or improvised units? And have you had to pay from \$5.00 to \$12.00 for them? The Argonne line brings you a wide variety for experimentation as well as for replacement. Efficiently designed to meet the needs of miniaturization and engineered to provide more power handling capacity and improved frequency response with minimum distortion. All are nickel-steel laminations except asterisk which are silicon steel. Average net weight 13.4 oz. average shipping wt. 4 ozs.

## QST — Vol. IV

(Continued from page 49)

including Canada. These stations will send at 11:30 P.M. their own local time. . . .

In Volume VI, at 11, May 1923, the short-wave "CQ Party" was reported as being a "decided success." Receipt of many logs was mentioned; and QST stated that "surprising distances on surprisingly low waves were recorded." The details were shown on pages 75 to 76, May 1923, under "Calls Heard." Logs were received from every district except the seventh. The range of wavelengths represented in the reports ran from 80 to 190 meters.

One result of some unspecified League test conducted in 1923 was later recorded in a headline affixed to an article by Dunmore, reporting some of the work done by the Bureau of Standards in the short-wave region. (See 75 to 77, July 1923, which is also in Volume VI):

. . . Attention is also invited to the fact that in our short-wave tests 6GI with a 5-watt tube set dropped to the supposedly impractical wave of 125 meters and on both nights of the test put a roaring signal into every state in the Union. . . .

On the night of November 27th, 1923, transatlantic amateur communication was first accomplished. A wavelength of 100 meters was used. Station 1MO, at West Hartford, Connecticut, with Traffic Manager Schnell at the key, worked French 8AB (Leon Deloy, of Nice, France). Shortly afterward, on the same night, John L. Reinartz (1XAM, ex-IQP, of South Manchester, Connecticut) also worked 8AB. All three stations used transmitting circuits devised by Reinartz. (On all of this, see Volume VI of QST, at 9 to 12, January 1924; and 26 to 27, January 1924).

Thereafter, there was no doubt in any amateur's mind that the use of waves around 100 meters in length, or even shorter, possessed DX capabilities; and that the reward arising from their use would be long-distance two-way communication with low power and not simply temporary relief from QRM. The lure of DX work was irresistible; and amateur developments in the short-wave field followed very quickly — both as to transmitting and receiving equipment.

Wayzata, Minnesota

## Strays

The amateur fraternity is saddened to learn of the death of F. Dawson Bliley, W3GV, ex-W8GU. Mr. Bliley had been active in amateur radio since 1920 and was the founder and president of the Bliley Electric Company. In addition to being a QST author, W3GV was highly active in v.h.f. circles. He was a pioneer of the 1 1/4-meter band and for some time held the 2-meter DX record.

## How's DX?

(Continued from page 63)

band quite a bit in search of WN/KN QSOs. However, Dan transmits on 7025, 7039 and 7065 kc., somewhat far afield to be spotted by Novices. On your mark for the 4th LABRE (Brazil) DX Contest scheduled for the first and second week ends of next month, c.w. and phone, respectively, 0001 GMT, Saturdays, to 2400, Sundays. The usual six-digit (c.w.) and five-digit (phone) serials will be exchanged — RST001, RST002, etc. — and all bands 80 through 6 meters may be used. **Scoring:** Contacts between stations (a) in the same country count zero points but add the multiplier; (b) of different countries, both outside the American area, count one point each; (c) of different countries within the American area count two points each; and (d) in the American area and stations in the rest of the world count three points each. The "American area" is that compassed by LABRE's WAA Award Countries List and is synonymous with North and South American countries listed on the ARRL DXCC Countries List. Multipliers designated are one per band for each American area country worked, and one per band for each Brazilian call area (PY1 through PY9) worked. For final score multiply contact points gained on all bands by the number of multipliers gathered on all bands, A1 only or A3 only. (The same station can be QSO'd on different bands.) As discerned from valid logs postmarked no later than November 30th, the LABRE Contest Commission, Caixa Postal 2353, Rio de Janeiro, will award 1st and 2nd-place certificates to multiband and single-band high scorers in each country and in each Brazilian call area. See you on the north-south path, amigos!

**Hereabouts** — HP1EH was prepared to have some rare fun in July but didn't get much chance. In error Louis was issued the call HO1EH. Panama authorities caught the switch before QSLs were printed. T19MHB's QSL brought W2QHH back into a magic circle. Howy has 229 postwar countries worked and 229 confirmed, a rare 100-per-cent situation, indeed. W2QHH also has worked 282 different KPs and has a confirmation from each. Incidentally, Howy picked off a French Saint Martin station in 1947, got the pasteboard, and now is one of the few who have this new ARRL Countries List addition verified. Speaking of St. Martin and other hard-to-bag Caribbean areas, several prominent DX personalities now are on the prowl down that way with portable stations. Other straws in the DX wind: Gough Island, near Tristan da Cunha (G3HPM as ZD9AD), the Comoros (Madagascar FB8s), Vatican State (numerous aspirants), Rhodes (SV0WU and others), and Tonga (VR2BZ). Watch out for a rare sleeper or two! KL7ZG hooked F8LF on May 24th, VQ4EU on the 25th, and believes these QSOs to be the first KL7-Europe and KL7-Africa contacts on 15 meters. Any KL7 comments to the contrary?

## Harmonics

(Continued from page 43)

rig is built from QST or Handbook plans, you might write to ARRL. However, since ARRL has not tried and tested the rigs described in contributed articles, you will probably save time by writing directly to the authors of such articles, whose addresses appear in the author's footnotes.

Good hunting, OM, and be careful to stay in the bands!

## Appendix

For the benefit of Official Observers and others interested in the problem of amateur harmonics in the 7350 - 7500-ke. region, we list below the calls and frequencies (approximate) of some commercial marker stations heard in this region.

7345 — OFB77	7437 — HBN
7347 — WWL53WWK47	7442 — HBP3

\* Single-sideband type signal.

\*\* Frequency-shift Morse signal.

## The Indian sang his death song

**100** YEARS AGO, during a frontier skirmish, an Indian brave, singing his own death song, charged down on a young officer, Lieutenant George Crook, 4th Infantry, coolly fell to one knee, carefully aimed, and dropped the brave in his tracks.

It was not Crook's first Indian, nor his last. By the time he made general, Crook was the greatest Indian-fighter this country has ever had.

Yet, he was also one of the best friends the Indians have ever had. For he understood them well, dealt fairly and firmly, and always kept his promises.

When Crook died, Indians wept. And a Sioux chief named Red Cloud said: "He never lied to us. His words gave the people hope."

No nation can ever have enough men like George Crook. But America had, and still has, a lot of them. That's important to remember. Because it is a wealth of human character rather than a wealth of money that gives America its real worth. Just as it is the Americans, all 160 million of them, standing behind our country's Savings Bonds, who make these Bonds one of the world's finest investments.

For your sake—and America's—why not take advantage of this fact? Invest in—and hold—United States Savings Bonds.

It's actually easy to save money—when you buy United States Series E Savings Bonds through the automatic Payroll Savings Plan where you work! You just sign an application at your pay office; after that your saving is done for you. And the Bonds you receive will pay you interest at the rate of 3% per year, compounded semiannually, for as long as 19 years and 8 months if you wish! Sign up today! Or, if you're self-employed, invest in Bonds regularly where you bank. There's no surer place to put your money, for United States Savings Bonds are as safe as America!

## What Is This Thing Called the "Hump" in CODE?

THE hump (around 8 words) is the thing that tells you you have wasted your time by starting out wrong. Thirty years ago when we started teaching Code our students too ran head-on into the hump. We went to work to find out why. TWO-PHASE, STEP BY STEP instruction is the perfect answer. In this method dotdash is not A. The SOUND resulting from dotdash is A. There is also the important factor of correct timing. If the signals are not timed correctly the resulting sound will not be correct. There are many, many things connected with proper Code instruction, many of them so small they seem inconsequential. Others are so technical that many so-called experts fail to understand them. It's a long story but I have it all written up and will be glad to send it to you. A postcard will bring you the full story.

## FEED-BACK

In "Parallel 6146s in the Mobile or Fixed-Station R.F. Assembly," page 16, June QST, R<sub>3</sub> in the text should be two 15K 1-watt resistors in parallel (not two 1.5K resistors as listed).

# Transmit-Receive ON One Antenna

## WITH AUTOMATIC CHANGEOVER

**Model 380**

Here is fully automatic electronic antenna changeover from receiver to transmitter and *vice-versa*—Suitable for all power applications up to the legal limit. B&W's new T-R switch is ideal for voice operated SSB—AM phone and break-in CW—all with one antenna.

- Ends annoying antenna changeover relay clatter
- Lets you select one antenna for receiving and transmitting—automatically
- You get actual signal gain from 1 mc to 35 mc
- Broad band—no tuning or adjustments
- Fail-safe device protects final amplifier, low-pass filter, shielded link—antenna load is always coupled to transmitter
- Power loss virtually unmeasurable
- Operates with either 52 or 75 ohm coax line
- Compact—completely self-contained

See it at your distributors' or write for literature

(Continued from page 50)

and for vice-director but members are urged to interest themselves equally in the two offices.

League members are classified as Full Members and Associate Members. Only those possessing Full Membership may nominate candidates or stand as candidates; members holding Associate Membership are not eligible to either function.

Voting by ballots mailed to each Full Member will take place between October 1st and November 20th, except that if on September 20th only one eligible candidate has been nominated, he will be declared elected.

Present directors and vice-directors for these divisions are as follows: *Atlantic*: Gilbert L. Crossley, W3YA, and Charles O. Badgett, W3LVF. *Canadian*: Alex Reid, VE2BE, and Reginald K. Town, VE7AC. *Dakota*: Alfred M. Gowan, W0PHR, and Forrest Bryant, W0FDS. *Delta*: George H. Steed, W5BUX, and George S. Acton, W5BMM. *Great Lakes*: John H. Brabb, W8SPF, and Robert L. Davis, W8EYE. *Midwest*: William J. Schmidt, W0OZN, and James E. McKim, W0MVG. *Pacific*: Harry M. Engwicht, W6HC, and (no vice-director). *Southeastern*: James P. Born, jr., W4ZD, and Randall E. Smith, W4DQA.

Full Members are urged to take the initiative and to file nomination petitions immediately.

For the Board of Directors:

A. L. BUDLONG  
Secretary

July 1, 1955

## YL News & Views

(Continued from page 53)

may be used. A card from the District of Columbia may be submitted in lieu of one from Maryland.

3) Contacts with all 48 states must be made with stations operated by licensed women operators.

4) Contacts with all 48 states must be made from the same location. Within a given community one location may be defined as from places no two of which are more than 25 miles apart.

5) Contacts may be made over any period of years provided only that all contacts are from the same location as defined in Rule 4.

6) Forty-eight QSL cards, or other written communications from stations worked confirming the necessary two-way contacts, must be submitted by the applicant to the custodian for the WAS-YL award. Sufficient postage must be sent with the confirmations to finance their return. The YLRL will not be responsible for any loss or damage to same.

Custodian for the WAS-YL award is Lou Littlefield, W1MCW, 19 State Avenue, Cape Elizabeth, Me. Only seven of these awards have been issued to date — to W1FTJ, W2QHH (OM), W3OP (OM), W4ARR (OM), W4SGD, W8IJWX, and W9CMC (OM).

## YLCC Award

The YL Century Certificate for confirmed contacts with stations operated by 100 or more different licensed women amateur radio operators is issued by the YLRL at no cost to the applicant upon compliance with the following rules:

1) Two-way communication must be established on the authorized amateur bands with stations — mobile or fixed — operated by 100 *different* licensed women amateurs. Any and all amateur bands may be used.

2) All contacts must be made from the same location. Within a given community, one location may be defined as from places no two of which are more than 25 miles apart.

3) Contacts may be made over any period of years, provided only that all contacts are from the same location as defined in Rule 2.

4) Contacts with YLs anywhere in the world are recognized provided that confirmations clearly indicate that the stations contacted were operated by duly licensed women amateur radio operators.

5) One hundred QSL cards or other written communications from the stations worked confirming the necessary two-way contacts, accompanied by a list of claimed contacts

## 100 KC CRYSTAL CALIBRATOR

Provides accurate check points for transmitting frequency or for calibrating receivers and VFO's!

Extremely compact, this tiny crystal calibrator provides accurate 100 kc. check points to 55 mc. High quality, hermetically sealed military type crystal is superior to those usually found in a unit of this type. Circuit uses a 6BH6 tube and has an adjustable ceramic trimmer condenser for exact zero beating of the crystal to WWV or other standard.

Measuring only  $1\frac{1}{4}" \times 2\frac{1}{2}" \times 1\frac{1}{2}"$ , the chassis may be mounted inside receiver cabinet or in any convenient spot. (Overall height to top of tube is  $3\frac{3}{8}"$ .) Power may be taken from your receiver or other source—requires only 6.3 volts at .15 amps. and 150 to 300 volts at 2 ma. Special clips are provided for tube prongs of equipment furnishing power take-off. Power cable and extension leads are included to permit remote mounting of switch. Furnished completely wired and tested with tube.

Cat. No. 250-28 CRYSTAL CALIBRATOR

which should include the full names of the operators (alphabetically arranged) and the dates and times of contacts, must be submitted by the applicant directly to the YLCC custodian. Sufficient postage must be sent with the confirmations to finance their return by first-class mail. The YLRL will not be responsible for any loss or damage to same.

6) Endorsements: Confirmations of contacts, accompanied by alphabetical list, as per Rule 5, from stations operated by additional YLs may be submitted for credit each time 50 additional confirmations are available. Endorsements will be made to the original certificate as applications are approved.

7) Decisions of the YLCC custodian regarding interpretation of these rules as here stated or later amended shall be final. All inquiries regarding cards, applications, or the certificates should be addressed to her.

W7GLK, Dot Dickey, has resigned as YL Century Certificate custodian. Please hold QSLs until the new custodian, to be appointed by the president is announced in this department next month. To date 40 YLCC awards have been issued as follows:

1. W1BFT (OM)	17. W8SDD (OM)	33. W4LAS
2. W2QHH (OM)	18. W1VOS	34. W7ULK
3. W3JSH*	19. W0TAB	35. W8SPU
4. W8HLF	20. W6WRT	36. W6JZA

### WAC-YL Award

Any amateur offering proof of two-way communication with a YL operator on each of the six continents is eligible for a Worked All Continents-YL award. OM W2QHH holds the only such certificate issued to date.

Secy.-Treas. W0MMT, Marie Ellis, 608 Lesser Dr., Ft. Collins, Colo., or any of the officers given above will be pleased to furnish further details about the WAC-YL award.

### Keeping Up with the Girls

W7HHH, Bea, lists the YLs who attended the ARRL Oregon State Convention at Portland: W7s ECC, FKS, FXE, HHH, ITZ, LS, NJS, NTT, QKU, QWX, QXH, RAX, RIC, RVM, SBS, SBX, SJW, SPC, SYF, UEL, ZKY, ZLT and W7N's ENU, UFN, WFO, WRA, AMN, and ZNK. . . . Officers of the LARK for the new term are President Helen, W9BCA; V. P. Rita, W9YXK; Secy. Mardine, W9IWP; Treas. Evelyn, W9YWH; Publicity Chairman Peg, W9SYX; "Pinfeather" editor Adeline, W9LDK; Novice representative Blanche, W9TDC. . . . OM W3YFW writes that he and his wife W3APT, Betty, are enjoying 80 and 40 c.w. together. Betty had her first QSO only a few hours before she gave birth to a baby girl. . . . Present at a Smorgasbord luncheon marking the final meeting of the season of the N. Y. C. YLRL were W2s EEO, EUL, IGA, IQP, QGK, MVV, OWL, QWL and Treas. Helen Zuparn. . . . New officers for the Los Angeles YLRC are President Helene W6QOG; V. P. Lorraine, W6AKE; Recording Secy. Jayne, K6GMX; Corresponding Secy. Lucille, K6EXV, and Treas. Gladys, W6DXI. In less than a year, club membership has almost doubled, with a current total of 60 YLs. . . . W9BCA and her OM participated in a TV show arranged by Hallierafters Co. of Chicago. Helen's seeing-eye dog, curled at her feet, listened to his mistress engage in a four-station QSO on two meters. . . . YLs who gathered for an informal meeting at the Dayton Hamvention were W3UUG, W4s UDQ, WJP, W8s HPP, LGY, MVA, OSD, RVP, RZN, SPU, VWL, WN8TXI, W9UJ and KL7BHE.

FOR COMMUNICATORS OR OTHER  
LOW POWER 2 METER EQUIPMENT....

Same size and style  
as Communicator....

### Highlights.....

- Push-pull 826's VHF triodes with forced air cooling.
- Power supply utilizes two, 5U4GB rectifiers in a husky, voltage-doubling circuit.
- Built-in antenna changeover relay.
- Operates as a linear amplifier. Delivers AM signal of 50-60 watts carrier with only 4 to 5 watts drive.
- Available for aircraft and other commercial and governmental frequencies on special order.
- Can operate readily with 2 meter equipment of other manufacture.

a 10 time  
increase  
in output power

## 2 meter linear .... R.F. POWER AMPLIFIER

Communicator owners everywhere are fast joining the "Big signal" ranks by installing this effective, economical 2 meter linear amplifier. Here is a typical Gonset "VHF Power Package", carefully engineered for dependable, simplified operation. Requires mere minutes from installation to top, on-the-air performance...

## HAMFEST CALENDAR

**ALABAMA** — The North Alabama Hamfest will be held this year on Sunday, August 28th, in the Tri-Cities — Florence, Sheffield, Tusculumbia. Something planned every minute. You are welcome to yak and chew the rag with your old buddies, but if you want entertainment it will be there. Ask the fellow who came last year to Decatur! He'll be back! Phil Lawrence, W4DGN, P. O. Box 9, Decatur, Alabama, is the ticket man. \$1.00 attendance, meal tickets available.

**ARIZONA** — The Ft. Huachuca Amateur Radio Club will sponsor a hamfest at the Army Electronic Proving Grounds on September 3rd, 4th, and 5th.

The Army air strip will be available for civilian planes, but it will be necessary to sign a waiver releasing the Army from responsibility; 5 10-5 insurance desired if possible. Overnight camping facilities available. Motels are also nearby. There will be activities for the XYs and children. Some playground facilities are at the picnic area.

**IDAHO** — The annual WIMU Hamfest will be held August 5th, 6th, and 7th at Big Springs, Idaho. The registration this year is expected to exceed 250. Rex Roberts, W7CPY, the Northwestern Division Director, will be in attendance, and a large number of radio clubs in the four-state area will be represented. For further info contact W7BAR.

**ILLINOIS** — Sunday, August 14th at Mance Park, ¼ mile east of Route 45 and ¼ mile south of Route 66 (Stinson Airport) the 21st Annual Picnic and Airmobile Meet of the Hamfesters Radio Club. The friendliest get-together in the Midwest. Planes can home in on WTAQ frequency 1300 kc. Four towers at this radio station are 190 feet tall. Planes parked free, but pilots must bring their own tie-downs. Food, ice cream, and beverages available. Games and contests for kiddies and grown-ups. Plenty of tables and free parking. Donations are \$1.00 in advance and \$1.25 at the gate. Tickets available from Jesse P. Markham, W9YNV, 37 No. Lotus, Chicago 44, Ill.

**INDIANA** — The Tri-State Amateur Radio Society will hold its 9th annual Hamfest on Sunday, August 28th, at Bowers Grove which is located 8 miles north of Evansville and 2 miles west of Grumpy Pals on Highway 41. There will be large signs posted along the highway and there will be transmitters on 10 and 75 meters to direct all comers to the grounds which will have plenty of shade and a screened-in shelter house. The activities will start at 10 A.M. CDST with games and contests for all members of the family. A basket dinner will be held at noon with refreshments available on the grounds. The registration fee will be \$2.50 per person. For other info, contact Callie Jones, W9UHV.

**MAINE** — The Annual Hamfest will be held at Stevie's, W1BOK, August 14th, at Dexter in the heart of Maine. The usual good feed will be served at noon. A dual mobile hunt with two hidden transmitters will be the feature of the day. Group meetings will be held during the day for various nets, such as Drag Net, Barnyard Net, Sea Gull Net, etc. This is the only large hamfest in Maine this year, so plan to attend. Reservations can be made with W1BOK, Stevie, in Dexter or with W1BPI, Al, in Casco. Let's go, gang. Come meet your old friends.

**MINNESOTA** — The St. Cloud, Minn., Radio Club is holding its annual amateur family picnic on August 28th. It will be held at the Sauk Rapids City Park. Come and meet the gang there. It begins at 1 P.M. CST. Games for YLs and children. If further information is desired, contact Jack Maus, W0MBD, 417 — 8th Ave., South St. Cloud, Minn.

**OHIO** — The Buckeye Shortwave Radio Association, Akron, Ohio, will hold its annual picnic Sunday, August 28th, at Happy Days camp in Akron Metropolitan Park. Games for the children, and fun for the YL or XY. An outstanding event in Ohio in past years, it promises to be even bigger and better this year. Registrations start at 12 noon daylight time. \$2.00 per family. Reach the park via Peninsula Road west from Ohio 8, east from U. S. 21, or via Sand Run Road north from Ohio 18. 3860 and 29,560 will be monitored to direct mobiles. Further info from WSVQI or WSWAV.

## Correspondence

(Continued from page 51)

% WFO  
Farmville, Va.

Editor, *QST*:

For years it has been a pleasure to scan the diagrams printed in *QST*. That is, until recently — the henscratching which seems to be the current vogue could, in my opinion, provide satisfaction only to a power engineer or an Egyptian stone cutter.

If this is progress I, for one, would prefer to remain static in this instance and let the power people conform to the communication standard if they should so desire. If not, let them wallow in a maze of hieroglyphics and leave us be.

— C. K. Chrismon, W4GIW

73 Mather Ave.  
Groton, Conn.

Editor, *QST*:

I cannot understand what all the fuss over the new symbols is about. It is axiomatic that we go ahead or fall behind. Any move to keep the ham informed is a good one, in my estimation. Would suggest to draftsmen that larger dots at junctions would be easier for the eye to follow a circuit. . . .

— Thomas S. Paterson, WITVN

276 Monmouth Ave.  
New Milford, N. J.

Editor, *QST*:

Glancing at the "Correspondence" column of the July *QST*, it became apparent that not too many members are in accord with my feelings on the new circuit symbols. My advice to these people is [censored]! The new symbols are certainly no violent change. Personally I like them. Keep up the good work. At least I appreciate it!

— J. Herm Rickerman II, K2HXP

## QSL DOGHOUSE

76 Highland Road  
Glen Cove, L.I., N. Y.

Editor, *QST*:

When I read of WØPDN writing to excuse some peoples' QSL peculiarities (May *QST*) it was with some effort I restrained my desire to take pen in hand.

Now that W3EQK (July *QST*) has arisen I must rush to defend VQ3CP (both his 'phone and c.w. QSLs came here air mail) and VQ2DT (his 'phone and c.w. cards for several bands arrived promptly) — we also have two cards from EA9DC — but I do share EQK's idea of a particularly appropriate doghouse for —, —, —, —, several "prominent" W1 and W6 "high scorers," and some

MANUFACTURERS OF PRECISION ELECTRONIC EQUIPMENT

## Is YOUR Voice Heard?

FOR more than forty years, the American Radio Relay League has been the amateur's own organization, operating under policies established by directors of his choice, serving as a clearing-house for information, representing him at international conventions, before Federal agencies and national groups, and providing other services to make his hobby enjoyable as well as useful.

MEMBERS of the League in eight ARRL Divisions will soon be nominating and voting for the directors who will represent them for the next two years. Every amateur taking part in these elections helps further the aims and protects the privileges he has as a ham. Naturally, only League members vote in ARRL elections. Let your voice be heard—sign up now.

more (fortunately really few) outstanding exponents of the maturity theory of self election to the "untouchable non-QSL caste."

— J. Albert Stobbe, W2WZ

39 Sobro Avenue  
 Valley Stream, N. Y.

Editor, QST:

Read W0PDN's letter in May QST with considerable interest. He refers to an ET2 station. . . . I don't think that W0PDN has much experience in the QSL rackets as they exist today. This station is one of a number of rare ones that periodically show up on the bands and work 5-600 stations, mostly Ws and then never QSL — except to DX editors and prominent hams, for obvious reasons. Now . . . my question is: What do they do with the International Reply Coupons?

— Theodore J. Seiter, W2FJH

P. O. Chileka  
 Nyasaland

Editor, QST:

I've had more than a little correspondence with various stations, mostly Ws, who have sent me QSLs, claiming QSOs which have not taken place. I have returned the cards to the senders.

Some time ago, I informed W9BRD of the stations who qualify for my blacklist. Maybe it's a coincidence that these hopeful QSL seekers make up the greater part of this list.

One W3 gentleman waxed indignant in a letter to me, after I had returned his card. In it, he states that DX stations only reply to the "kw. and beam" fraternity and that W QRP stands no chance of working the DX. If he had the opportunity of scanning my QSL files, he would see that over half my W cards are for QSOs with stations using 150 watts and less. This self-same W3 was responsible for ruining a QSO with a much wanted EAS, by carefully zeroing the latter and calling me as I stood by to pull the EAS through the racket. How crazy can one get?

To cap it all, this W3 fella says "why do you work a W more than once and why don't you keep the QSOs snappy when there are lots waiting?" It would be funny if it weren't tragic. As an example from my log on Nov. 16, 1954, I worked 47 W fellas in 110 minutes. If that isn't good enough, I'll apologize for being a slow operator. As for the number of times I QSO any particular W, I guess that's my business. There are some Ws, in particular, with whom a QSO is a pleasure indeed, when I feel like more than a mere exchange of RSTs and 73.

Finally, just a reminder — let's not forget that remote stations are keen on DX themselves and do not exist solely to provide fun for Ws and Gs. I've held VS7, VS1 and G calls since the end of '45 and therefore have been on both sides of the DX fence. It's flogging a dead horse, I know, but how fine it would be if the over-eager beavers would be a little more patient and keep their fingers off the bug until they know the DX station is ready for a call.

That's my little piece. Good huntin' to the savvy boys and may the others learn the error of their way.

— Vic Thorne, ZD6BX

## TV INTEREST

1465 N. Villere St.  
 New Orleans 16, La.

Editor, QST:

I read with interest the article on TV servicing in the June issue of QST. While I realize that QST is supposed to be "of, by and for the radio amateur," I think such articles are timely and of interest to a large portion of the ham fraternity. . . .

I think more such articles from time to time would improve QST.

— A. L. Maurin, W5MXP

R.F.D. No. 1  
 Glastonbury, Conn.

Editor, QST:

Many thanks for the article, "Elementary TV Trouble Shooting," by W7MID in June QST. "Best" covers a lot of territory, but this one is certainly one of the best in QST for some time, and this issue will be especially marked on the binding, as are some others, for ready reference. I think that space in QST was very well used.

— Bun Doubleday, W1UJA

# HAM-ADS

(1) Advertising shall pertain to radio and shall be of nature of interest to radio amateurs or experimenters in their pursuit of the art.

(2) No display of any character will be accepted, nor can any special typographical arrangement, such as all or part capital letters be used which would tend to make one advertisement stand out from the others. No Box Reply Service can be maintained in these columns, nor may commercial type copy be signed solely with amateur call letters.

(3) The Ham-Ad rate is 30¢ per word, except as noted in paragraph (6) below.

(4) Remittance in full must accompany copy. No cash or contract discount or agency commission will be allowed.

(5) Closing date for Ham-Ads is the 20th of the second month preceding publication date.

(6) A special rate of 7¢ per word will apply to advertising which, in our judgment, is obviously non-commercial in nature, and is placed and signed by a member of the American Radio Relay League. Thus, advertising of bona fide surplus equipment owned, used and for sale by an individual or apparatus offered for exchange or advertising inquiring for special equipment, if by a member of the American Radio Relay League take the 7¢ rate. An attempt to deal in apparatus in quantity for profit, even if by an individual, is commercial and all advertising by him takes the 30¢ rate. Provisions of paragraphs (1), (2) and (5), apply to all advertising in this column regardless of which rate may apply. To expedite handling of your copy please state whether you are a member of ARRL.

(7) Because error is more easily avoided, it is requested signature and address be printed plainly. Typewritten copy preferred, but handwritten signature must accompany all authorized insertions.

(8) No advertiser may use more than 100 words in any one issue nor more than one ad in one issue.

*Having made no investigation of the advertisers in the classified columns, the publishers of QST are unable to vouch for their integrity or for the grade or character of the products or services advertised.*

## The No. 90651 GRID DIP METER

The No. 90651 MILLEN GRID DIP METER is compact and completely self contained. The AC power supply is of the "transformer" type. The drum dial has seven calibrated uniform length scales from 1.5 MC to 300 MC plus an arbitrary scale for use with the 4 additional inductors available to extend the range to 220 kc. Internal terminal strip permits battery operation for antenna measurement.

# NEW MULTIPHASE "Q" MULTIPLIER

- Peaks Desired Fone or CW Signal
- Nulls Out Interfering Carrier up to 50 DB.
- No Loss in Speech Intelligibility

- No Insertion Loss — New Two Tube Circuit
- Special High "Q" Pot Core Inductor

**MODEL  
AQ**

**MODEL DQ**

**MODEL  
B  
SLICER**

## CONVERTS MODEL A SLICER

Plugs into Model A accessory socket, converting it into a Model B. New front panel and controls provided. Enjoy all the advantages of "Q" Multiplier selectivity on CW, AM & SSB with your present Model A Slicer.

Wired ..... \$29.50  
Kit ..... \$22.50

## FOR AM, CW, SSB OPS

Desk Model "Q" Multiplier for use with any receiver having 450 to 500 KC IF. In attractive, compact case with connecting power-IF cable. Power supplied by receiver. Also provides added selectivity and BFO for mobile SSB or CW reception.

Wired ..... \$29.50  
Kit ..... \$22.50

## BUILT-IN "Q" MULTIPLIER

Upper or lower sideband reception of SSB, AM, PM & CW. For use with any receiver having 450-500 KC IF.

Wired ..... \$99.50  
Kit ..... \$69.50

## MODEL A SLICER

Same as Model B but less "Q" Multiplier  
Wired ..... \$74.50  
Kit ..... \$49.50

## A NEW CONCEPT IN LINEARS

## MULTIPHASE 600L

### BROAD BAND LINEAR AMPLIFIER

### NO TUNING CONTROLS!

### SINGLE KNOB BANDSWITCHING 10-160 METERS

- Single 813 in Class AB<sub>2</sub>. Approx. 2 watts effective or 4 watts peak drive for 500 watts DC input.
- New band-pass couplers provide high linear efficiency: 60-65%.
- Designed for 50-70 ohm coaxial input and output.
- Built-in power supply. Bias and screen regulation. Automatic relay protection.
- Exclusive metering circuit reads grid current,

watts input, RF output, reflected power from mismatched load - switch to any position while on the air!

- Completely shielded - TVI suppressed. Free of parasites! Low intermodulation distortion.
- Choice of grey table model (17 $\frac{1}{8}$ " W, 8 $\frac{3}{4}$ " H, 13" D) or grey or black rack model.

Wired, with tubes ..... \$349.50

**MODEL 20A**

- 20 Watts P.E.P. Output SSB, AM, PM and CW
- Bandswitched 160 — 10 Meters
- Magic Eye Carrier Null and Peak Modulation Indicator

Choice of grey table model, grey or black wrinkle finish rack model.

Wired and tested ..... \$249.50  
Complete kit ..... \$199.50

## MULTIPHASE EXCITERS

### Check These Features

### NOW IN BOTH MODELS

- Perfected Voice-Controlled Break-in on SSB, AM, PM.
- Upper or Lower Sideband at the flip of a switch, with 40 DB. suppression.
- New Carrier Level Control. Insert any amount of carrier without disturbing carrier suppression adjustments.
- Talk yourself on frequency.
- Calibrate signal level adjustable from zero to full output.
- New AF Input Jack. For oscillator or phone patch.
- CW Break-in Operation.
- Accessory Power Socket.

**MODEL 10B**

- 10 Watts P.E.P. Output SSB, AM, PM and CW.
- Multiband Operation using plug-in coils.

Choice of grey table model, grey or black wrinkle finish rack model. With coils for one band.

Wired and tested ..... \$179.50  
Complete kit ..... \$129.50

## TOP BUYS IN FAMOUS KNIGHT BUILD-YOUR-OWN KITS

**Easy-to-Build  
TOP  
QUALITY  
KNIGHT  
VFO  
KIT  
only  
\$29<sup>50</sup>**

Here's a complete, top quality VFO with built-in power supply. Features careful design and voltage regulation for extremely high stability. Excellent oscillator keying characteristic for fast break-in. TVI suppression through shielding, by-pass capacitor and components layout. Plenty of bandspread; separate scales for 40, 20, 15 and 10 meters (11 and 80 meters have combined meters); smooth vernier drive. Dual-chassis construction keeps heat from frequency deconstruction circuits. Output cable just plugs into crystal socket of your xmitter. Output on 80 and 40 meters. Uses 6BH6 Clapp oscillator, 6BH6 buffer-doubler, 6X4 rectifier, OA2 voltage regulator. Off-Transmit switch for "no swish" tuning. Extra switch contacts for operation of relays or other equipment. Complete with tubes and all parts, gray and blue steel cabinet (only 8 1/2 x 6 x 5 1/2"), instructions and diagrams. For 110-120 volts, 50-60 cycle AC. Shpg. wt., 8 lbs.

**83 S 725. Knight VFO Kit. Only... \$29.50**

**FREE** Send for our lists of Top Buys in Reconditioned Ham Gear

Everyone's trading high with ALLIED these days, and we have on hand outstanding buys in exceptionally fine reconditioned Ham Gear. Ask for our lists of money-saving, top-condition equipment.

**FREE: ALLIED'S LATEST BARGAIN SUPPLEMENT**

It's packed with big values and new releases in Kits, Hi-Fi systems and components, P. A. Systems, recorders, test instruments, ham gear, parts, tubes and tools. Write for FREE Supplement No. 148 today.

**BUILD YOUR OWN  
GEIGER COUNTER**  
with this Super-Value Kit

only **\$15<sup>95</sup>**

**SUPER-SENSITIVE  
URANIUM LOCATOR  
& RADIOACTIVITY  
DETECTOR**

the equal of many instruments selling at several times our low, low price .....

Here's an extremely sensitive instrument for locating uranium and for industrial and lab use—comparable in quality and performance to costly equipment, yet easy to build at only a fraction of the price. It's simple to operate: just turn it on and occasionally flip the high-voltage switch—as radioactive source is approached, clicks in headphone rapidly increase. Uses low-cost long-life batteries. Kit includes all parts, case with handle and leather shoulder strap, 22 1/2 volt and 1 1/2 volt batteries, AEC prospecting booklet, radioactive sample and headphones. Complete instructions, including schematic and pictorial diagrams. Size: 6 3/4 x 5 1/4 x 2 1/4". Shpg. wt., 2 1/2 lbs.

**83 S 242. Knight Geiger Counter Kit. Only \$15.95**  
**80 S 663. Extra Battery Kit. Only... \$1.07**

**ORDER THESE KIT VALUES TODAY!**

**ALLIED RADIO CORP., Dept. 15-H-5

# SOON

# NC-300

National's great New

*dream  
receiver*

*Combining the most wanted features of thousands of "Dream Receiver" suggestions submitted by hams around the world!*

**S**OON at your favorite distributors you'll see the first receiver in history specifically designed to realize the radio amateur's fondest dreams!

National conducted its great "Dream Receiver" contest month after month, to find out *what hams want most*. The NC-300 combines the most wanted features from all of the thousands of "Dream Receiver" ideas submitted. You can expect prize-winning performance from the NC-300 because it's a real prize-winner. And you'll *get it*—because solidly behind this dream receiver stands National's 41-year reputation.

Hams have dreamed of a receiver like this for years. Soon it will be a dream come true. Watch this magazine for the announcement of NC-300 Day—the date distributors everywhere unveil the receiver with the features most hams want, *at a price most hams are willing to pay*.

**IT'S GOT WHAT MOST HAMS WANT... AT A PRICE MOST HAMS ARE WILLING TO PAY:**

- longest slide rule dial ever—more than a foot long!
- Band Coverage: 160–1¼ meters with 10 separate scales including National's exclusive converter provision for 6, 2 and 1¼ meters.
- No greater sensitivity in any receiver (3–6 db noise figure on all amateur bands.)
- Features greater stability than most receivers costing up to \$695!

● Tuned to tomorrow. Styled to match.

*tuned to tomorrow*

NATIONAL COMPANY, INC.  
61 SHERMAN ST., MALDEN 48, MASS.

**WATCH FOR NC-300 DAY! To be announced SOON**

Final amplifier of the Harvey-Wells  
T-90 Bandmaster Transmitter—  
using the RCA-6146.

## Leading Amateur Designs

## ...USE RCA TUBES

You are looking at the business end of a Harvey-Wells T-90 Transmitter. In this "final" an RCA-6146 beam power tube delivers the signal punch that gives this transmitter its reputation for ability to "get out."

Here's why RCA high-perveance beam power tubes, like the 6146, are preferred by leading designers of amateur and commercial transmitters.

RCA beam power tubes make it practical to use fewer components; fewer tuning controls—*fewer stages*. They lend themselves to bandswitching circuits—take full plate input with smaller drivers (a big help in reducing TVI). RCA beam power tubes give you the power you want *at lower plate voltages*.

RCA High-Perveance Beam Power Tubes are available at your RCA Tube Distributor—for amateur transmitters having input-power ratings up to a "gallon." For technical data on any specific beam power tube type including the 6146, write RCA, Commercial Engineering, Section H37M, Harrison, N. J.

BEAM POWER TUBE RCA-6146

90 watts ICAS input on CW; 67.5  
watts on 'phone. Full input to 60 Mc.  
Reduced input up to 175 Mc.

In This Issue! — AMATEUR COMMUNICATION BY SOLAR POWER

OUR MILLIONTH FILTER SHIPPED THIS YEAR...

# FILTERS

## FOR EVERY APPLICATION

### TELEMETERING FILTERS

UTC manufactures a wide variety of band pass filters for multi-channel telemetering. Illustrated are a group of filters supplied for 400 cycle to 40 KC service. Miniaturized units have been made for many applications. For example a group of 4 cubic inch units which provide 50 channels between 4 KC and 100 KC.

Dimensions:  
(4682A) 1½ x 2 x 4".

Dimensions:  
(3834) 1¼ x 1¾ x 2-3/16".  
(2000, 1) 1¼ x 1¾ x 1¾".

### AIRCRAFT FILTERS

UTC has produced the bulk of filter used in aircraft equipment for over a decade. The curve at the left is that of a miniaturized (1020 cycle) range filter providing high attenuation between voice and range frequencies.

Curves at the right are that of our miniaturized 90 and 150 cycle filter for glide path systems.

### CARRIER FILTERS

A wide variety of carrier filters are available for specific applications. This type of tone channel filter can be supplied in a varied range of band widths and attenuations. The curves shown are typical units.

Dimensions:  
(7364 series) 1½ x 1½ x 2¼".  
(9648) 1½ x 2 x 4".

### DISCRIMINATORS

These high Q discriminators provide exceptional amplification and linearity. Typical characteristics available are illustrated by the low and higher frequency curves shown.

Dimensions:  
(6173) 1-1/16 x 1½ x 3".  
(6174A) 1 x 1¼ x 2¼".

For full data on stock UTC transformers, reactors, filter units, and high Q coils, write for Catalog A.

**UNITED TRANSFORMER CO.**

150 Varick Street, New York 13, N. Y. EXPORT DIVISION: 13 E. 40th St., New York 16, N. Y. CABLES: "AT"

**LAST YEAR'S WINNER.** Benjamin S. Hamilton, W6VFT, is congratulated by Val Peterson, right, Administrator, Federal Civil Defense Administration. J. Milton Lang, general manager of the G-E Tube Department, looks on.

# NOMINATIONS NOW OPEN FOR 1955 EDISON AWARD

The Fourth Annual Edison Radio Amateur Award will give you an opportunity to recommend for high honors an amateur who has rendered important public service.

Handsome trophy, a \$500 check, and coast-to-coast recognition await the 1955 winner. The panel of judges will consider only candidates nominated by letters from you and others.

Start now to make your selection and assemble the facts for your nominating letter. Read the Award Rules at right!

Radio amateurs and their friends are generous in acclaiming accomplishment. No better means for this exists than for you to name . . . soon . . . a candidate for the Edison Award.

Send your letter to *Edison Award Committee, General Electric Company, Tube Department, Schenectady 5, N. Y.*

## RULES OF THE AWARD

**WHO IS ELIGIBLE.** Any man or woman holding a radio amateur's license issued by the F.C.C., Washington, D.C., who in 1955 performed a meritorious public service in behalf of an individual or group. The service must have been performed while the candidate was pursuing his hobby as an amateur within the continental limits of the United States.

**WINNER OF THE AWARD** will receive the Edison trophy in a public ceremony in a centrally located metropolitan city. Expenses of his trip to that city will be paid.

**\$500 GIFT.** Winner will be presented with a check for this amount in recognition of the public service he has rendered.

**WHO CAN NOMINATE.** Any individual, club, or association familiar with the service performed.

**HOW TO NOMINATE.** Include in a letter the candidate's name, address, call letters, and a full description of the service performed. Your letter must be postmarked not later than January 2, 1956.

**BASIS FOR JUDGING.** All entries will be reviewed by a group of distinguished and impartial judges. Their decisions will be based on (1) the greatest benefit to an individual or group, (2) the amount of ingenuity and sacrifice displayed in performing the service. The judges will be:

**E. ROLAND HARRIMAN**, President, The American Red Cross.

**HERBERT HOOVER, JR.**, The Under Secretary, U. S. Department of State.

**EDWARD M. WEBSTER**, Commissioner, Federal Communications Commission.

**GOODWIN L. DOSLAND**, President, American Radio Relay League.

Winner of the Award will be announced on or before Thomas A. Edison's birthday, February 11, 1956.

Employees of the General Electric Company may nominate candidates for the Edison Radio Amateur Award, but are not permitted to receive the Award.

### *Collins*

## KWS-1 TRANSMITTER

the finest kilowatt in Amateur  
SSB history owes its fast-grow-  
ing reputation to features  
such as these—exclusive  
with Collins:

- ADVANCED SAFETY MEASURES include complete interlocking of the high voltage circuits, no exposed high voltage in RF cabinet, and p.a. plate meter in B—lead.
- 1 KC DIAL DIVISION on all bands — 80 through 10 meters.
- SPECIAL SIDEBAND GENERATION utilizing Mechanical Filters provides 60 db sideband suppression.
- PERMEABILITY TUNED CIRCUITS allow effective spurious suppression.
- DUAL CONVERSION, with stability comparable to the famous 75A Receivers, makes the KWS-1 as stable on 10 meters as it is on 80.
- UNPRECEDENTED COMPACTNESS with all controls necessary for tuning and operating in one receiver-size cabinet.
- NO P.A. BANDSWITCH. Network for continuous tuning from 3.5 to 30 mc with constant L/C ratio over entire range.

Write or visit your nearest Collins distributor for complete information on Collins new SSB Amateur line, and ask for your copy of this latest brochure.

**and ready to "scramble" . . . . .**

America's Armed Forces, alert and on guard, are ready to swiftly defend our country or to strike back at the enemy. Hallicrafters is alert to this emergency which requires dependable electronics equipment. Our facilities are *now* developing, perfecting and producing secret equipment for the Air Force and other branches of the service. The unmatched experience of over twenty years in electronics, plus the lessons gained in producing vital communications during World War II and the Korean conflict, make Hallicrafters a "Primary Producer" for the United States Armed Forces.

*World's leading exclusive manufacturers  
of communications radio*

# There's a PR for every Service!

## AMATEUR

### 40, 80 and 160 Meters, PR Type Z-2

Rugged. Low drift, fundamental oscillators. High activity and power output. Stands up under maximum crystal currents. Stable, long-lasting, permanently sealed.....\$2.95 Net

### 20 Meters, PR Type Z-3

Harmonic oscillator. Low drift. High activity. Can be keyed in most circuits. Stable as fundamental oscillators. Fine for doubling to 10 and 11 meters or "straight through" 20 meter operation.....\$3.95 Net

## COMMERCIAL

### COMMERCIAL, PR Type Z-1

Designed for rigors of all types of commercial service. Calibrated .005 per cent of specified frequency. Weight less than 3/4 ounce. Sealed against moisture and contamination. Meets FCC requirements for all types of service.

## SPECIAL TYPES

### Type Z-1, AIRCRAFT

3023.5 Kc., .005%.....\$3.95 Net

### Type Z-1, MARS and CAP

Official assigned transmitter frequencies in the range.  
Calibrated to .005%. 1500 to 10000 Kc. **\$3.95 Net**

### Type Z-6A

#### FREQUENCY STANDARD

To determine band-edge. To keep the VFO and receiver properly calibrated.

100 Kc. . . . . **\$6.95 Net**

### Type 2XP

Suitable for converters, experimental, etc. Same holder dimensions as Type Z-2.

1600 to 12000 Kc.  
(Fund.)  $\pm 5$  Kc.  
... **\$3.95 Net**

12001 to 25000 Kc. (3d Mode)  $\pm 10$  Kc. . . . **4.95 Net**

### VHF Type Z-9A

For Lear, Narco and similar equipment operating in the 121 Mc. region, requiring crystals in 30 Mc. range.

Each . . . . . **\$6.95 Net**

### Type Z-9A RADIO CONTROLLED OBJECTS

27.255 Mc., .04% . . . **\$3.95 Net**

### Type Z-1 TV Marker Crystals

Channels 2 through 13 . . . . . **\$6.95 Net**

4.5 Mc. Inter-carrier, .01% . . . **3.95 Net**

5.0 Mc. Sig. Generator, .01% **3.95 Net**

## Section Communications Managers of the ARRL Communications Department

**Reports Invited.** All amateurs, especially League members, are invited to report station activities on the first of each month (for preceding month) direct to the SCM, the administrative ARRL official elected by members in each Section. Radio club reports are also desired by SCMs for inclusion in *QST*. **ARRL Field Organization station appointments** are available in the areas shown to qualified League members. These include ORS, OES, OPS, OO and OBS. SCMs also desire applications for SEC, EC, RM and PAM where vacancies exist. *All amateurs* in the United States and Canada are invited to join the Amateur Radio Emergency Corps (ask for Form 7).

## SELECTABLE SIDE BAND RECEIVER

### BUILT TO THE SPECIFICATIONS OF 1,000,000 FIELD EXPERTS

See it at Your Jobber—only \$295<sup>00</sup>

Hallicrafters 22 years of production know-how, the engineering experience of developing over 100 different major receiver designs, plus the advice of over 1,000,000 field experts operating Hallicrafters receivers all are combined to bring you this outstanding new receiver—the SX-100! Hallicrafters alone, long recognized as the leading designer and manufacturer of quality communications equipment, can offer you the dependability and performance of this great new SX-100 at the amazingly low price of just \$295.00.

Look at these features you enjoy with the SX-100 . . . before, they were available only on receivers costing a great deal more!

#### 1. SELECTABLE SIDE BAND OPERATION.

2. "TEE-NOTCH" FILTER—This new development provides a stable non-regenerative system for the rejection of unwanted heterodyne. The "Tee-Notch" also produces an effective steepening of the already excellent 50 KC i.f. pass band (made famous in the SX-96) and further increases the effectiveness of the advanced exalted carrier type reception.

3. NOTCH DEPTH CONTROL for maximum null adjustment.

4. ANTENNA TRIMMER.

5. PLUG IN LABORATORY TYPE EVACUATED 100 KC QUARTZ CRYSTAL CALIBRATOR—included in price.

6. LOGGING DIALS FOR BOTH TUNING CONTROLS.

7. FULL PRECISION GEAR DRIVE DIAL SYSTEM.

8. SECOND CONVERSION OSCILLATOR CRYSTAL CONTROLLED—greater stability through crystal control and additional temperature compensation of high frequency oscillator circuits.

#### Controls

Pitch Control  
Reception  
Standby  
Phone Jack  
Response control (upper and lower side band selector)

# THE AMERICAN RADIO RELAY LEAGUE, INC.,

is a noncommercial association of radio amateurs, bonded for the promotion of interest in amateur radio communication and experimentation, for the relaying of messages by radio, for the advancement of the radio art and of the public welfare, for the representation of the radio amateur in legislative matters, and for the maintenance of fraternalism and a high standard of conduct.

It is an incorporated association without capital stock, chartered under the laws of Connecticut. Its affairs are governed by a Board of Directors, elected every two years by the general membership. The officers are elected or appointed by the Directors. The League is noncommercial and no one commercially engaged in the manufacture, sale or rental of radio apparatus is eligible to membership on its board.

"Of, by and for the amateur," it numbers within its ranks practically every worth-while amateur in the nation and has a history of glorious achievement as the standard-bearer in amateur affairs.

Inquiries regarding membership are solicited. A bona fide interest in amateur radio is the only essential qualification; ownership of a transmitting station and knowledge of the code are not prerequisite, although full voting membership is granted only to licensed amateurs.

All general correspondence should be addressed to the administrative headquarters at West Hartford, Connecticut.

## Past Presidents

HIRAM PERCY MAXIM, W1AW, 1914-1936  
EUGENE C. WOODRUFF, W8CMP, 1936-1940  
GEORGE W. BAILEY, W2KH, 1940-1952

## Officers

**President** . . . . . GOODWIN L. DOSLAND, W0TSN  
Moorhead, Minnesota

**First Vice-President** . . . . . WAYLAND M. GROVES, W5NW  
P.O. Box 586, Odessa, Texas

# "It Seems to Us..."

## HELPING NEWCOMERS

Here it is September again — our vacations are over, the ol' swimmin' hole has lost some of its grip on us, the summer QRN has started to fade away. Our thoughts turn once again to active hamming; the local club gets going again in full swing. It seems time for a reminder of a couple of related worth-while projects for the local gang to tackle.

Hams have long held out a helping hand to newcomers on an individual basis. In the past few years, more and more radio clubs have been offering formal courses in amateur radio for beginners, with club members sharing the teaching tasks. Prospective hams have been attracted to the courses by notices in the papers, in schools, and at Scout and civic club meetings. Now is a good time for your club to start laying plans for this year's course. If help is needed, the Communications Department of ARRL offers assistance in the form of code-practice schedules, course outlines, and training aids. Whether or not you ask for aid, however, the Communications Department would like to know about your course so that other newcomers in your area can be steered your way.

A closely-related project is the setting up of a committee to conduct examinations for Novice, Technician and Conditional Class aspirants. As earlier editorials pointed out, it is important that these "mail" examinations be conducted with uniform standards, to ensure that only qualified people obtain licenses, and to ensure that all applicants have equal opportunity. The objective can best be accomplished by appointing mature, qualified amateurs to serve on examination committees in every club throughout the country. This system has an advantage over the use of individual, uncoordinated examiners, however qualified they may be personally, in that prospective amateurs can be notified through the press, radio and other media mentioned above of the time and place of the tests.

FCC has expressed (*QST*, September, 1954, page 9) the hope that all clubs will establish such committees. The District Engineers are anxious to know when these groups go into operation and are always ready to assist in getting them started. It may be possible for committees to keep a supply of application

blanks and test papers on hand, speeding the licensing process considerably for anxious applicants.

Every activity needs new blood, and these two projects will help to assure the continuing flow of eager newcomers into amateur radio. Here's your chance to train new operators the way they should be trained, and build up the club at the same time.

## WHICH CALL TO SIGN?

As we hams are a thoroughly fraternal bunch, it is hardly news that many new licensees quickly take up the pleasant custom of station-visiting. But our correspondence recently indicates a misunderstanding on one aspect — what call does W1AAA sign when he is visiting W1BBB?

There's only one answer. When operating another ham's station, you sign his station call, not your own personal station's call. You can indicate in the course of conversation that your own station is W1AAA, but that's pure conversation and not part of the signing procedure. The call you sign for the station's operation is W1BBB. And of course the data goes into the station's log, not your own back home.

We should perhaps remind you that a station may be operated only within the privileges available to both operator and station license. For example, Novice WN1AAA can visit General Class W1BBB and operate the latter station, but only in the Novice bands, using crystal-control, and 75 watts or less input. The call to be signed is W1BBB. The General Class operator can pay a return visit and operate WN1AAA, of course signing that call, but again only under Novice privileges. It would not be proper for the General Class operator to operate the Novice-licensed station by signing his personal station call in other than Novice bands. Nor can he use VFO or more than 75 watts input at the Novice station on the theory that he is licensed for such operation; surely he is, but the Novice's station isn't.

Keep up the visiting, OMs, but remember that you sign the call of the station being visited, and are limited by the scope of its station license and your operator license, whichever privileges are the lesser.

## A.R.R.L. CONVENTIONS

### SOUTH DAKOTA STATE CONVENTION

*Yankton, So. Dak. — September 3rd and 4th*

The Prairie Dog Amateur Radio Club is sponsoring, and will be host to, the 1955 ARRL South Dakota State Convention to be held in Yankton, So. Dak., September 3rd-4th. It will be held in the Msgr. Link Memorial Auditorium and banquet hall adjoining. Program starts at 1:00 P.M. CST Saturday, Sept. 3rd. Registration begins at 9:00 A.M., continues in afternoon as needed.

The program will include ARRL section net meetings, technical meetings, Novice c.w. QSO contest, informal mixer, musical code contest, "war whoop" breakfast, mobile judging, hidden-transmitter hunt on 75 meters, tours of state hospital and/or Gavans Point dam construction, and banquet with "family-style" meal, at which the Governor of So. Dak. is scheduled to speak.

Ample playground and parking facilities available. Golfing, etc., available for those not participating in convention activities.

Registration, including 1 banquet ticket, \$5.00; additional banquet tickets, \$2.25. Send advance registrations to Neal Edwards, 201 Locust St., Yankton, South Dakota.

### SOUTHWESTERN DIVISION CONVENTION

*San Diego, Calif. — October 1st and 2nd*

The San Diego Council of Amateur Radio Organizations in sponsoring the 1955 ARRL Southwestern Division Convention to be held in San Diego, Calif., on October 1st and 2nd. It will be held in the famous exposition facilities of Balboa Park, commencing with registration at 9:00 A.M. Saturday, October 1st. Preconvention activities will be held at the Manor Hotel during Friday evening, September 30th.

The program will include mobile contests, transmitter hunts, miscellaneous contests, exhibits, ROWH ceremony, ARRL open forum, technical talks, v.h.f. round-up, YLRL activities, DX activities and a host of other events.

The banquet, entertainment and dance will be held on Saturday evening. Registration (including banquet, dance, etc.) is \$6.50 per person. For advance registration and information, write J. Roy Smith, W6WYA, General Chairman, 2052 Venice St., San Diego 7, Calif.

## HAMFEST CALENDAR

**CONNECTICUT** — The Laurel Amateur Radio Assn. is sponsoring the first annual Conn. Hamfest Picnic on September 18th, all day, at MacLean's Grove, Granby, Conn. Admission one dollar for the entire family. Several contests for OMs and XYLs; also awards for best mobile installation. Bring your own food and drink. Guest speakers and other entertainment.

**KENTUCKY** — The Second Annual Lexington Hamfest will be held on Sunday, September 25th, at the Lexington Water Company's Reservoir (same place as last year) on U. S. 25, east, about 2 miles from Lexington. There will be a hidden-transmitter hunt and other activities for young and old. Box lunches will be available on advance notice and remittance of \$1.25 per lunch for either fish or chicken. All remittances for lunches and tickets should be sent to Dr. H. L. Echols, 2000 Nicholasville Rd., Lexington, Ky., on or before Sept. 23rd.

**LOUISIANA** — The Greater New Orleans Amateur Radio Club announces the second annual "Week End in Old New Orleans," Labor Day week end. Dance on Saturday, September 3rd, and ham picnic on Sunday, September 4th. Special events and contests for the ladies and children. Admission to dance, \$2.50; admission fee to picnic, \$1. Come and enjoy Labor Day in old New Orleans. Write "Week End in Old New Orleans," P. O. Box 13003, New Orleans, La.

**NEW YORK** — Saturday, September 24th, at the Masonic Temple Dining Room, 230 Main St., Oneida, N. Y., 11th Annual Hamfest and Ladies Night of the Oneida Area

## COMING A.R.R.L. CONVENTIONS

**September 3rd-4th — South Dakota State, Yankton, S. D.**

**September 30th-October 1st-2nd — Southwestern Division Convention, San Diego, Calif.**

**October 15th-16th — Central Division, South Bend, Ind.**

**October 22nd-23rd — Midwest Division, Omaha, Neb.**

radio amateurs. Admittance at \$3.00 per person is by advance registration only and is limited to 150 persons, the capacity of the dining room. Registration will start at 5:00 P.M., banquet at 7:00 P.M. Make all reservations before September 22nd with Walter L. Babcock, W2RXW, 405 Sayles St., Oneida, N. Y.

**OHIO** — 18th Annual Stag Hamfest, Sunday, September 11th. Biggest bargain hamfest in U. S. A.; over 800 actual amateurs attended last year. Sponsored by the Greater Cincinnati Amateur Radio Association. The location is Kopleng Grove on Winton Road two miles south of Greenhills, Ohio. Registration \$2.50 at the gate — here's what you get: hot dogs all day long, donuts and coffee served till noon, beer and pop served all day, full picnic dinner and supper (all you can eat), rain or shine. Lots of games, radio-controlled model airplane show, etc. For additional information, contact Elmer Schubert, W8ALW, 3965 Hammar Court, Cincinnati 11, Ohio.

## OUR COVER

E. Laird Campbell, W1CUT, shown operating the first solar powered station. The transmitter consists of a 2N76 transistor, while the receiver is the "Little Gem" field-strength meter. For further details see page 11.

## Strays

W7GND has come up with an easier way of modifying the 1625 tetrodes used in the "200-Watt Linear amplifier," June QST.

He found that the cathode and suppressor leads are brought out to the tube pin in the National Union type 1625. By drilling a  $\frac{3}{8}$  inch hole in the side of the tube above the cathode pin and one over an unused pin, the suppressor wire can be unsoldered from the cathode and connected to the unused pin.

In order to determine which lead is the cathode and which is the suppressor, the filament is lighted and the electron flow from each of the unknown wires to the plate is measured. The combination with the larger current determines the cathode lead, while the other is the suppressor.

## ARE YOU LICENSED?

• When joining the League or renewing your membership, it is important that you show whether you have an amateur license, either station or operator. Please state your call and/or the class of operator license held, that we may verify your classification.

# Solarized QSO

## Amateur Communication Using Solar Power

BY E. LAIRD CAMPBELL, WICUT

• Here is something to whet the imagination of the Buck Rogers and Dick Tracy sets: radio communication with the necessary electrical power derived directly from sunlight. We hesitate to predict an immediate switch by everyone to solar power only, but it isn't difficult to visualize a future of ultra-compact stations dependent upon the cloud conditions or even the phase of the moon ("moon power") for their S-meter readings. Imagine calling a rare piece of DX just as the sun goes behind a cloud, and the frantic scrambling for matches and burning material to keep the call going!

"Q RX ol' man, cloud approaching." These words were not unusual at North Granby, Conn., during the 1955 ARRL Field Day activities. Concern over the weather was quite reasonable considering that perhaps the first solar-powered amateur station was in operation. Both the transmitter and receiver incorporated transistors and were powered completely by energy from the sun.

### Power Supply

Power for the transmitter and receiver was obtained from six self-generating selenium photo-electric cells. These were the International Rec-

<sup>1</sup>Campbell, "Transistorized 'Little Gem'", *QST*, Aug., 1955.

Solar-powered amateur station. The solar battery can be seen clamped to the top left of the operating table. The transistor transmitter is in the center with the receiver to the left.

tifier type B2M, and had an output of 0.5 volts at 2 ma. each. The six cells were connected in series and mounted on a piece of lucite. This was then bolted to a bracket on a ball and socket clamp to aid in orienting the battery toward the sun. Under a load of 0.5 ma. the battery produced about 2.8 volts in direct sunlight and would drop to below 2 volts in diffused sunlight.

### Transmitter

A transistor in a crystal-controlled oscillator circuit was used for a transmitter. As can be seen

Fig. 1 — A block diagram of the solar-powered station.

in Fig. 2, a minimum of components is required. The transistor is a General Electric type 2N76 and it oscillated easily at 1800 kc. By placing a carbon microphone or a key in series with the power supply, the transmitter could be operated

Fig. 2 — Transistor transmitter. Tank inductance  $L_1$  is a Vari-Loopstick with a link coil wound around the outside of the coil form.

on 'phone or c.w. A random length wire served as an antenna with good results.

### Receiver

The receiver used was a Transistorized "Little Gem" <sup>1</sup> in the field-strength meter position. The effective circuit can be seen in Fig. 3. The tuned signal is rectified by the crystal diode detector and amplified by the transistor (Hydro-Aire

(Continued on page 110)

# The "2B3" Superheterodyne

*A Simple "Minimum" Receiver for 80 and 40 Meters*

BY BYRON GOODMAN, WIDX

**T**HE title of this article has no more justification than that it identifies a particular design and, if you know the code we just invented, it signifies a "2-band 3-tube" superheterodyne. It is the dull end result of looking around for a title to describe a little superheterodyne that will serve anyone quite well as his first ham-station receiver.

This receiver started out as an attempt to build a practical two-band receiver that would more than hold its own with anything selling for thirty dollars. No attempt was made to make it an "all-band" affair—we figured we were licked from the start in that department. But by confining the tuning range to two amateur bands, we knew it would be possible to build in operating features, such as adequate bandspread and

• The receiver described on these pages is called a "minimum" receiver by the author because, in his opinion, it represents the minimum in receiving equipment that will give a good account of itself under present band conditions. The simple construction makes it an easy matter to duplicate the receiver.

lating) state, hoping that the resultant selectivity would be sufficient for adequate single-signal c.w. reception. It wasn't, and it was also observed that the 6U8 pentode section used as the regenerative detector was a little more microphonic than we care to have such things, so a 6BD6

This two-band superheterodyne receiver uses an autodyne second detector and adjustable antenna coupling. The dial pointer and black trim strips are made of black Scotch Tape. The control marked "Feed-back" is the regeneration control.

good stability, that are quite hard to come by in an inexpensive all-band commercial job. We started out with three dual triodes: one as a mixer-oscillator, one as a detector-b.f.o., and the third as a two-stage audio amplifier. Investigating selenium-rectifier *vs.* tube-rectifier power supplies, it was found that the latter was cheaper. The dual triodes were 6SN7s, because the sockets for these tubes are cheaper than those for the miniature tubes. But the performance of the finished product didn't come up to our expectations—the triode mixer was touchy and the detector-b.f.o. combination didn't behave as had been hoped. The original objective of absolute rock-bottom cost was scrapped, and we turned to the use of miniature tubes. Here a logical choice for mixer-oscillator and detector-b.f.o. seemed to be the 6U8 triode-pentode. A homemade 1700-kc. i.f. transformer was substituted for the commercial unit previously used, but again we weren't satisfied with the detector. We were using it in a regenerative (but nonoscil-

lating) state, hoping that the resultant selectivity would be sufficient for adequate single-signal c.w. reception. It wasn't, and it was also observed that the 6U8 pentode section used as the regenerative detector was a little more microphonic than we care to have such things, so a 6BD6

## The Circuit

While few will argue about the sensitivity of an autodyne detector, anyone who has worked with one knows that the loading is critical, and an antenna swinging in the breeze may "pull" the frequency. Then, too, the regeneration control setting may need changing as one tunes a band. Using an autodyne detector at a low fixed frequency obviates these shortcomings but dictates a superheterodyne type of receiver. By

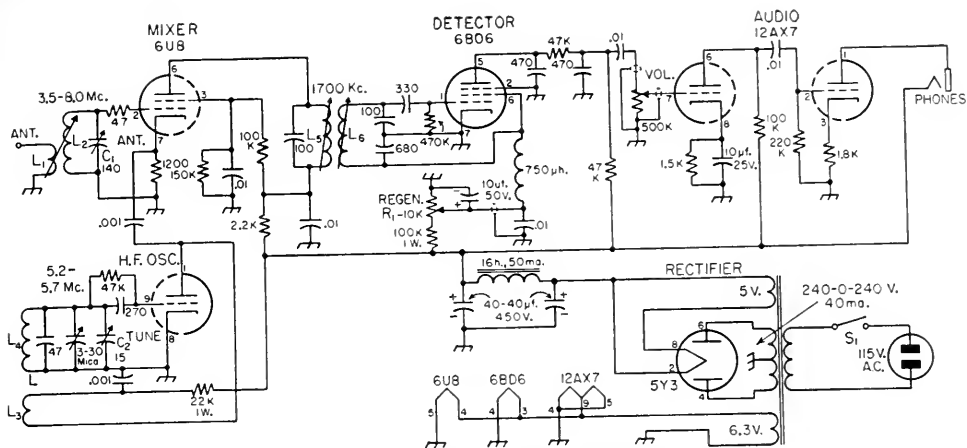

Fig. 1 — Schematic diagram of the two-band superheterodyne.

- C<sub>1</sub> — 140-μf. midget variable (Hammarlund HF-140).  
 C<sub>2</sub> — 15-μf. midget variable (Hammarlund HF-15).  
 R<sub>1</sub> — 10,000-ohm 2-watt wire-wound potentiometer (Clarostat A43-10K).  
 L<sub>1</sub>, L<sub>2</sub>, L<sub>3</sub>, L<sub>4</sub> — B & W No. 3016 Miniductor, 1-inch diam., 32 turns per inch, No. 22 wire.  
 L<sub>1</sub> — 12 turns.  
 L<sub>2</sub> — 26 turns.  
 L<sub>3</sub> — 8 turns.  
 L<sub>4</sub> — 21 turns, separated from L<sub>3</sub> by one (removed) turn.

Adjacent turns on L<sub>3</sub> and L<sub>4</sub> go to 0.001 μf. and chassis respectively.

L<sub>5</sub>, L<sub>6</sub> — Grayburne Vari-Loopstick. (80 μh., approx.)

S<sub>1</sub> — Mounted on 500K volume control.

All resistors 1/2-watt unless specified otherwise. All capacitances in μf. unless otherwise noted. All fixed capacitors except two across L<sub>6</sub>, one across L<sub>4</sub>, and the electrolytics (polarity marked) are ceramic. Fixed capacitors across L<sub>4</sub> and L<sub>6</sub> are silver mica.

Power transformer is Knight (Allied Radio) 62-G-034, filter choke is Knight 62-G-137, filter capacitor is Mallory 2N-537.

limiting the frequency range of the receiver to two consecutive amateur bands and using an i.f. of half the frequency difference between the two bands, it is possible to "change bands" simply by tuning the input circuit to the one band or the other. For example, with the high-frequency oscillator tuned to 5.3 Mc., and the i.f. at 1700 kc., the receiver responds to either a 3.6-Mc. signal (5.3 — 3.6 = 1.7) or a 7.0-Mc. signal (7.0 — 5.3 = 1.7), depending upon the tuning of the mixer grid circuit. It is a convenient arrangement that permits building a bandspread two-band receiver with no bandswitching. To listen on higher frequencies, a crystal-controlled

converter can be used ahead of the set, working into it at 80 meters.

Referring to the circuit in Fig. 1, it can be seen that adjustable input coupling is provided (variable coupling between L<sub>4</sub> and L<sub>2</sub>). While the signal level can be reduced by detuning the 140-μf. ANT capacitor, C<sub>1</sub>, the adjustable coupling is easy to construct and permits reducing the input level without detuning. The high-frequency oscillator output is coupled to the cathode of the pentode mixer, to provide a low-noise mixer and a minimum of "pulling." Changing the setting of the ANT capacitor does not pull the oscillator frequency appreciably unless the

The miniature tubes, from left to right, are 6U8, 6BD6 (in shield) and 12AX7. The left-band variable capacitor tunes the mixer input circuit, and the small one in the center tunes the high-frequency oscillator. Note the phono-jack antenna terminal and headphone output jack on the wall of the chassis. The tuning capacitor at rear center is mounted on an aluminum bracket.

mixer input circuit is tuned close to the oscillator frequency, a condition that is never used.

The 1700-kc. i.f. transformer ( $L_5$  and  $L_6$  and the associated shunt capacitors) uses two of the compact ferrite-cored b.c. antenna coils that have become popular recently. They have the twin virtues of low cost and quite adequate  $Q$  for this job. The regenerative detector uses the Colpitts circuit to eliminate the need for tapping the coil or adding a tickler winding. An electrolytic capacitor across the regeneration control eliminates the noise produced by varying the wire-wound potentiometer. This potentiometer was selected instead of a composition affair because of a personal preference for such controls wherever any significant current is involved.

The two-stage audio amplifier is conventional, except that we started out with no cathode bypass capacitors and found that the one shown on the first stage reduced some a.c. hum. The a.e. switch,  $S_1$ , is mounted on the audio volume control.

### Construction

An  $8 \times 12 \times 3$ -inch aluminum chassis plus a  $7 \times 13$ -inch panel provides enough metal for the receiver, with the single exception of the scrap of aluminum needed for the bracket that supports the 15- $\mu$ f. tuning capacitor,  $C_2$ . The panel is held to the chassis by the two shaft bearings and the regeneration-control potentiometer, as can be seen in one of the photographs. It will pay off to take a little care in the location of the holes for the National type K dial, in the interests of a smooth-tuning receiver. We built the tuning-capacitor bracket first, lined up the capacitor shaft against the panel to mark the dial bushing hole, and then used the template that comes with the dial to locate the drive bushing hole. The small knob that comes with the Type K dial was replaced by a large one, and a couple of drops of oil were used to lubricate the drive bushing.

Practically everything else in the receiver can be located from the photographs, but we will touch on one or two points. The adjustable antenna-coupling coil was mounted on the end of a length of  $\frac{1}{4}$ -inch diameter lucite rod by cutting the end of the rod at 45 degrees and cementing a small scrap of polystyrene sheet to this face. The scrap was then filed to fit inside the coil and secured with a few drops of Duco cement. Four small holes are drilled through the rod: two for the coil ends (which also serve as tie points for the flexible antenna and ground leads), one through which the antenna and ground leads are threaded and cemented, and the fourth through which a piece of No. 20 wire is pushed and bent back around the rod. This last wire serves as a shoulder that bears against a fiber (or metal) washer that in turn bears against a large rubber grommet with a  $\frac{1}{4}$ -inch hole, as shown in Fig. 2. The other side of the grommet has another washer between it and the panel bushing. The rod is pushed through the bushing, two more washers are added, and then the knob is put on. By pushing the rod out

through the panel as the knob is tightened, the rubber grommet is left in compression, and it serves as a simple friction lock for the control. It almost takes longer to describe the gadget than it does to build it.

The two coils  $L_5$  and  $L_6$  are mounted on 1-inch separated centers. The "phones" jack is insulated from the chassis by fiber washers. Both  $C_2$  and  $C_1$  capacitors are insulated from the chassis — the former by mounting it with short bushings on the mounting bracket, and the latter

Fig. 2 — Details of the adjustable antenna coupling coil. Part of the coil has been cut away to show the support.

by fastening it to the chassis with a machine screw through small extruded fiber washers. Clearance holes for leads from both stators and rotors of these capacitors were provided, as can be seen in the photographs. For those who question the author's sanity in going to this trouble to provide for rotor leads that could be made by simply anchoring the rotors to the chassis, we hasten to point out that one of our pet tricks is to provide short and single r.f. paths for circuits that are sometimes left to chance. In several instances it has apparently added considerably to the stability of oscillators, and we now do it as a matter of course.

The only other touch someone might argue with is the shielded leads to and from the volume control. These pass through a grommet in the chassis and make connection to the chassis only at the 12AX7 socket. This is a precaution that reduces hum in some cases where there are heavy a.c. chassis currents. The lead from the arm of the regeneration control was shielded also, in an effort to confine the 1700-kc. energy to the vicinity of the detector.

### Alignment

Assuming that the wiring is correct, that the tube heaters light when you turn on the set, and that the power supply delivers 250 to 300 volts, the first step is to check the detector. This is conveniently done with the 6U8 out of its socket — then if something is wrong in the "front end" it won't confuse the detector checking. With headphones plugged in and the receiver (less 6U8) warmed up, advancing the volume control should give a hissing sound in the headphones. Advancing the regeneration control (increasing the voltage on the 6BD6 screen) you should find a point where the hiss increases appreciably and perhaps a very slight hum is

heard. This is the point where the detector "oscillates" — below this point you won't get a beat note with c.w. signals, and beyond it you will. The detector works — the next step is to get it on 1700 kc. (If it doesn't work, check your wiring and the voltages at the 6BD6 and 12AX7 pins.) If you can beg, borrow or steal a test generator, it is a cinch to put the detector on 1700 kc. by adjusting the slug in  $L_6$  until the 1700-kc. signal is heard. The test signal need only be loosely coupled to  $L_6$  — a wire placed a foot from the coil and connected to the test generator should suffice. Lacking the test generator, you may be able to use a b.c. receiver by tuning it to around 1245 kc. If the receiver has a 455-kc. i.f., the oscillator will be close to 1700 kc., and if the b.c. receiver is placed within a few feet of the receiver under test, there will be enough radiation from the b.c. receiver to act as the test signal. Don't go by the calibration on the b.c. receiver; make a new one from known local stations.

When the autodyne detector is working satisfactorily and you have acquainted yourself a little with its operation, plug in the 6U8 and let it warm up. Trim  $L_5$  until you find a point where it pulls the detector out of oscillation, and detune it slightly until regeneration starts about 10 or 15 degrees farther along on the regeneration control,  $R_1$ , than it did when  $L_5$  was tuned well off the frequency. Check again to make sure that you are still on or close to 1700 kc.

Now connect an antenna (any wire 20 feet long or more) and swing the ANT capacitor,  $C_1$ , across its range. The receiver noise should increase at two points — one near minimum on the capacitor (40 meters) and one around  $\frac{3}{4}$  meshed (80 meters). The 3-30- $\mu\text{f}$ . compression oscillator trimmer should be set at about  $\frac{1}{2}$  turn back from its tightest setting. Leaving the ANT capacitor on 80 or 40 meters, tune around with the TUNE capacitor,  $C_2$ , until you locate some amateur signals. If you lack a frequency standard or the ability to borrow one, you have no alternative but to identify the bands by the limits of 'phone or c.w. signals in the various subbands. In any event, once you have found the signals, you can move the bands on the TUNE scale by changing the setting of the mica compression trimmer. However, unless the i.f. is *exactly* on

1700 kc., the 7.0- and 3.6-Mc. points, 7.1 and 3.7 Mc., etc., won't coincide as they do on the homemade scale shown in the photograph. Observing the error, however, you can bring the i.f. to 1700 kc. easily. Incidentally, the homemade scale is simply a sheet of white paper held down with black Scotch Tape, with a sliver of tape on the dial to serve as a pointer. The pointer laps over the "O" end, and the 0-100 scale of the dial can still be used for logging by referring it to the upper edge of the lower horizontal black strip on the right-hand side.

### Operation

For the reception of c.w. signals, the regeneration control is advanced far enough for the detector to oscillate, as indicated by the sudden increase in hiss. It may be noticed that on strong signals it is impossible to tune in a signal at a low beat note (200 to 300 cycles). This indicates that the signal is too strong and is "pulling" or "blocking" the detector. To overcome this, increase the regeneration control or reduce the antenna coupling. After you have used the receiver for a while, you will get used to the "feel" of it and you will find the settings that work best for various QRM levels.

When receiving a.m. 'phone, the regeneration control is maintained just below the oscillation point. It will soon be noticed that this is the most sensitive point for 'phone reception, since the gain of the detector decreases as you back off the regeneration control still more. The selectivity of the receiver for 'phone reception is not as great as can be expected from a small superheterodyne using several tuned circuits in a 455-kc. i.f. amplifier. However, you can make up a lot of this selectivity by decreasing the antenna coupling and running the detector just under the oscillation point. A strong signal decreases the selectivity of the regenerative detector, hence the need for reducing the signal by decreasing the antenna coupling. S.s.b. 'phone is received the same as a c.w. signal, by advancing the regeneration control past the oscillation point and tuning carefully about the signal until it becomes intelligible. Overload is again your enemy here, so run the antenna coupling at a value consistent with good signal/noise ratio.

The mixer input and high-frequency oscillator coils are mounted on tie points, as shown here. The antenna coil,  $L_1$ , is mounted on the end of a piece of lucite rod, as shown here and in Fig. 2. The leads to it are wrapped several times around the rod, to provide a "pig tail" connection.

# Upper-Air Conditions for Two-Meter DX

## Temperature and Water-Vapor Content Soundings for Some Famous Dates

BY JAMES S. COLLIER,\* W2QBB

THE v.h.f. man is well aware that a "temperature inversion," "steep water vapor gradient" or some such thing is necessary for tropospheric propagation of his signals over extraordinary distances.

W2BAV in his article, "Painless Prediction of Two-Meter Band Openings" (*QST*, October, 1949), pointed out the correlation between surface weather conditions and some good 2-meter openings. Similarly, this article will show the vertical distribution of temperature and moisture for times of good 2-meter DX.

Consider first the variation of temperature and water vapor with height as shown in Fig. 1. There are no temperature inversions (that is, an

Fig. 1 — U. S. Standard Atmosphere temperature curve. The water-vapor curve is one that would result if the relative humidity were 70 per cent from the ground elevation to 12,000 feet. Figures in parentheses in this and following drawings are values of mixing ratio.

increase of temperature with height<sup>1</sup>), and no sharp changes in the water vapor curve — just a steady decrease with altitude from a maximum at the earth's surface.

If a radio wave is to remain near the earth's surface and not be lost to outer space, some downward refraction is necessary. There would be no v.h.f. DX with the average sounding of Fig. 1, but the refraction under such conditions is sufficient to extend the v.h.f. range somewhat beyond the line of sight. A condition known as *superrefraction* (that is, more than ordinary refraction) is needed for real tropospheric DX.

\* 57 Chapel Ave., Buffalo 25, N. Y.

<sup>1</sup> An inversion is sometimes considered to exist if the temperature lapse rate (decline in temperature with altitude) is less than 3 degrees Fahrenheit for 1000 feet of altitude. — Ed.

<sup>2</sup> H. G. Booker, *Compendium of Meteorology*, pages 1290 to 1295, published by the American Meteorological Society, Boston, Mass.

• Most v.h.f. operators develop weather consciousness before they have been in the game very long. They know that the daily weather maps can give indications of possible favorable propagation. Here W2QBB shows the actual upper-air conditions needed for 2-meter DX, and presents some soundings taken in areas where long-distance contacts were made.

Now that we have seen what won't produce 2-meter DX, let's look at a sounding that has a superrefracting layer in it. Fig. 2 is a plot of an actual upper-air sounding obtained at Joliet, Illinois, on September 6, 1950. The data were obtained from a radiosonde instrument released at 2200 EST. The moisture content of the air is shown by plotting the ratio: grams of water vapor per kilogram of dry air. This is called the *mixing ratio*. In this sounding and those to follow, the altitude scale shows the height above sea level of the significant points. Therefore, the first point on a curve is at the elevation above sea level of the station and not necessarily at zero

Fig. 2 — Upper-air sounding made at Joliet, Ill., September 6, 1950, at 2200 EST. Superrefraction resulted from the sharp decrease in water-vapor content (CD). Points marked (MB) indicate motorboating in the radiosonde unit at low relative humidity levels.

altitude. No water vapor scale is shown as it would be different at each altitude. At certain minimum values of relative humidity, the radiosonde instrument transmits only a very low audio frequency. Where this occurs, MB (motorboating) is shown on the water vapor curve.

Superrefraction occurs with either (1) a temperature inversion exceeding 2.8° centigrade per 100 feet or (2) a rate of decrease of water vapor exceeding 0.5 gram per kg. per 100 feet.<sup>2</sup>

Fig. 3 — Upper-air conditions at the eastern end of the W9EQC-W2NLY path are shown by this sounding made at Albany, N. Y., on September 6, 1950, at 2200 EST. Superrefraction at 4000 feet altitude is indicated by the water-vapor curve.

Fig. 4 — Some idea of the upper-air conditions at Collierville, Tenn., can be gained from this upper-air sounding made at Nashville, Tenn., on October 30, 1950, at 2200 EST. The water-vapor gradient at 5000 feet was more than four times that necessary for superrefraction when W4HHK worked W3NKM, Pittsburgh, Penna.

In Fig. 2, the temperature at the inversion *AB* is seen to increase from 13°C to 18°C through an altitude difference of 800 feet. The gradient is therefore  $(18-13)/8 = 0.6^\circ\text{C}$  per 100 feet and is insufficient for superrefraction. At *CD* on the water-vapor curve, there is a decrease from 6.2 grams per kilogram to 1.9 grams per kilogram through an altitude difference of 400 feet. The gradient is  $(6.2-1.9)/4 = 1.1$  grams per kilogram per 100 feet, giving us a level of superrefraction.

Now let's see how some soundings check out with various 2-meter band openings.

On the evening of September 6, 1950, W2NLY, Oak Tree, New Jersey, worked W9EQC, Aurora, Illinois, a distance of nearly 750 miles. The nearest available sounding for the eastern end of this path is one made at Albany, New York. It is shown in Fig. 3. The sounding of Fig. 2, already discussed, is representative of conditions at the western end of the path.

On October 30, 1950, W4HHK, Collierville, Tennessee, contacted W3NKM, Pittsburgh, Pennsylvania, about 650 miles. The Pittsburgh sounding is plotted in Fig. 5, while the Nashville, Tennessee, sounding in Fig. 4 shows the probable conditions at Collierville.

Fig. 5 — Conditions at the eastern end of the W4HHK-W3NKM QSO are shown by this sounding made at Pittsburgh, Penna., on October 30, 1950, at 2200 EST. The rate of decrease of water vapor with height beginning around 2000 feet altitude is about 75 per cent greater than needed for superrefraction.

Fig. 6 — Upper-air sounding made at Toledo, Ohio, on July 23, 1949, at 2200 EST. The water-vapor gradient between 3000 and 4000 feet is more than three times that needed for superrefraction.

Fig. 7 — This sounding made at Charleston, S. C., on July 23, 1949, at 2200 EST shows why a Michigan-South Carolina contact was not made in spite of good conditions in the northern states. Only weak temperature and water-vapor gradients are evident.

In none of these soundings do the temperature inversions meet the criterion for superrefraction, but in every case there is a superrefracting water-vapor gradient.

With only surface weather data available to him, W2BAV expressed the view that a South Carolina-Michigan contact was apparently missed for lack of activity on July 23, 1949. While Michigan conditions were favorable as

shown by the Toledo, Ohio, sounding in Fig. 6, conditions in South Carolina were something different. The Charleston sounding (Fig. 7) does not show any water-vapor gradient steep enough nor any temperature inversion strong enough to produce superrefraction.

From this it may be seen that upper-air sound-

ings are the only reliable source of information as to where and when tropospheric DX may be worked. The isobars (lines of common atmospheric pressure) shown on daily weather maps provide good clues, but they are not infallible, as any experienced and observant v.h.f. man will testify.

## The Little Shack

### *A Neat Installation for the Living Room*

BY LEN H. SMELTZER,\* W4KZF

**P**ROBABLY many XYLS have frowned on having the ham shack in the living room because it doesn't look much like normal home furnishings. We wanted to put a small transmitter and receiver in the living room so we wouldn't spend all our time in the basement, so the question of a suitable enclosure immediately presented

small speaker, and similar gadgets, when closed. Sufficient space (approximately one inch) was left on top and on each side of the transmitter compartment for air circulation, and the backs of both compartments were left open for the same reason. The panel under the transmitter, near the floor, has sufficient room on the rear for mounting

❧

Cabinet fronts drop down to give access to equipment. They double as operating-table space when W4KZF is on the air.

Although simple in construction, the "little shack" fits in with its surroundings and conceals the appurtenances of the ham station.

❧

itself. When the 16-year-old junior operator came up with a design for a modern cabinet that met with the approval of the XYL, he and yours truly went to work with some 3/4-inch plywood, glue, and nails. The result is shown in the photographs.

This cabinet was built to size for a Viking Ranger and BC-342N receiver, with additional space in the receiver compartment for the control panel and Q-5er, plus storage space for mike, key,

\* Box 205, R.R. 2, Ludlow, Ky.

balun coils and an antenna relay out of sight.

Details of construction will not be given here because the sizes of the compartments will vary with each installation to accommodate the equipment in use. Also, the accessory equipment used with the receiver will help to determine the size of that compartment. Our purpose here is just to give an idea of what can be done with a little 3/4-inch plywood. If you can't build it yourself, maybe you have a friend or relative who likes to do a little woodworking.

# The S-FS Indicator

## A Signal/Field-Strength Meter for Mobile Use

BY C. VERNON CHAMBERS, W1JEQ

• The combination is a natural for mobile work. It will be found indispensable in the adjustment and servicing of receiving, transmitting and antenna systems. It is also most useful in transmitter hunting — a mobile activity that is enjoying widespread popularity.

SEPARATE UNITS for measuring signal and field strength were described by W8IWB and W0WLR in an earlier issue of *QST*.<sup>1, 2</sup> Both of these used a 1-ma. meter as the visual indicator, and a 500-ohm potentiometer for adjustment. The S-FS Indicator combines the original circuits in a compact package permitting a single meter and potentiometer to do double duty. The cost of the dual-purpose unit is very little more than that of either instrument alone.

The unit is small enough for mounting either above or under the dashboard of a car, or it may be stored in the glove compartment when not in use. It is housed in a 4 × 5 × 3-inch gray hammertone box and, complete with a new meter, costs approximately \$17.00 to build.

A simple toggle switch changes from one function to the other. Power drawn from the broadcast receiver for the S-meter circuit is less than 2¼ watts. The field-strength circuit requires no external power.

The field-strength meter can be used installed in the car as an antenna-resonance indicator or as an output indicator for transmitter adjustments, as described by Abel, or it can easily be removed for antenna-pattern plotting, adjustment of other mobile installations or even for use in the home station. The sensitivity adjustment makes the indicator useful over a wide range of field strengths.

One handy feature of the S-meter arrangement is the sensitivity control. This control can be adjusted to prevent extremely strong signals from pinning the meter. When working with really weak signals, the sensitivity control may be adjusted to provide a noticeable meter deflection.

Aside from ordinary signal-strength work, the S-meter may be used to advantage when aligning converter or receiver circuits, and it is worth its weight in gold in adjusting antenna trap circuits to suppress QRM from b.c. signal feed-through in converters.<sup>3</sup> Mobiles interested

in transmitter hunting will find the indicator indispensable when used in conjunction with a directional loop.

### Circuit

The circuit of the S-FS Indicator is shown in Fig. 1. A 12AX7 is used in the S-meter section. One grid is returned directly to chassis and the second grid is connected to the sensitivity control,  $R_1$ . The input end of  $R_1$  is returned, via  $J_2$  and a shielded cable, to the a.v.c. line in the b.c. receiver. The plates of the 12AX7 are con-

A front view of the S-FS Indicator. The zero-adjust control is to the right of the toggle switch,  $S_1$ . The meter registers either signal or field strength, depending upon the setting of the toggle switch.

needed in parallel and then, through a single lead, to  $J_2$ . Fig. 1 shows heater wiring for both 6- and 12-volt operation. Pin 9 of the tube is not used in the 12-volt circuit.

For S-meter operation, the meter and  $R_2$  are switched across the cathode terminals of the tube by  $S_1$ . The 500-ohm potentiometer,  $R_2$ , becomes a zero-adjust control. Zero reading is obtained with  $R_2$  adjusted for equal voltage at Pins 3 and 8 of the 12AX7. After an initial zero adjustment, the application of a.v.c. voltage through  $R_1$  will drive the cathode of  $V_{1A}$  negative with respect to the cathode of  $V_{2B}$ , thus upsetting the meter balance and causing an upward deflection. For a given a.v.c. voltage,

<sup>2</sup> Abel, "The 'Hidden Gem,'" *QST*, March, 1955.

<sup>3</sup> Chambers, "Bandswitching a Crystal-Controlled Mobile Converter," *QST*, January, 1955.

The bottom view shows the r.f. choke and the disk capacitors for the field-strength circuit mounted on a 2-terminal tie-point strip at the right side of the unit. The extra terminals on the

the amplitude of the deflection will be controlled by  $R_1$ .

The S-FS Indicator uses a Type 12AX7 in preference to the 6SN7 employed by WØWLL because it draws considerably less plate current. This saving is important if power for the S-meter, as well as the converter, is taken from the b.c. receiver. The 6SN7 and its prototype (12BH7) will work well in the circuit, but only at the expense of increased current drain.

The circuit of the field-strength section is electrically equivalent to the one described previously.<sup>2</sup> It is made active by switching the meter and  $R_2$  into the circuit and by applying r.f. through  $J_1$ . The amount of r.f. fed to the circuit may be controlled by adjusting the length of the pick-up antenna attached to  $J_1$ .  $R_2$  is a shunt to prevent off-scale readings when measuring strong r.f. fields.

### Construction

As shown in the top view, the Triplett model 227-T meter is mounted on the front panel of the utility box. If the meter is centered with its top edge  $1\frac{3}{8}$  inches down from the top of the panel, the barrel of the meter will not strike the folded-over lips at the front of the box when the unit is assembled.  $S_1$  and  $R_2$  are below the meter with a  $1\frac{1}{2}$ -inch space between mounting centers. Each control is centered  $1\frac{3}{8}$  inches up from the bottom of the panel.

The rear and the bottom views show the "U"-shaped chassis made from 1/16-inch thick aluminum stock. The width, depth and height of the chassis are 2 7/8, 3 and 1 11/16 inches, respectively. Panel-mounted controls ( $R_2$  and  $S_1$ ) clamp the chassis against the rear of the front panel as shown in the bottom view. A

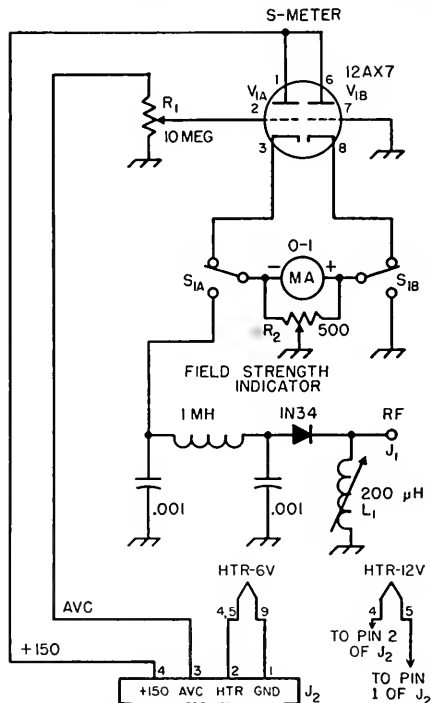

Fig. 1 — Circuit diagram of the S-FS Indicator.

slug-tuned coil are used for mounting the 1N34 crystal diode. Ordinary hook-up wire is used throughout.

### Installation

Heater, plate and a.v.c. voltages for the S-meter are obtained from the car b.c. receiver and should be brought to the indicator through shielded leads. A suitable cable can be made from lengths of Belden No. 8885 shielded wire. The heater lead may be tapped onto the hot side of any receiver tube (it is a good idea to stay clear of the rectifier tube) close to a hole or receptacle provided for the output cable. The plate lead may be connected to the screen pin of an audio output tube socket, to a low-voltage tap on the power supply or to any other point delivering approximately 150 volts (higher voltages merely increase the current drain unnecessarily). A series resistor may also be used to drop the voltage. It should have a value of approximately 285 ohms for each volt in excess of 150.

Finding the a.v.c. line in a car b.c. receiver is not always an easy job unless you are lucky enough to have a circuit diagram and a layout plan. It is frequently possible to spot the line by tracing back from the control grid of either the r.f. amplifier tube or the converter. The grid of each tube is usually returned to the a.v.c. bus through a  $\frac{1}{2}$ - to 1-megohm resistor. If you test a junction for a.v.c. voltage, just connect a high-resistance d.c. voltmeter between the point and ground and watch for a negative reading that increases with increased signal input. Local b.c. stations can supply the test signals.

After the interunit cabling has been completed, the receiver may be returned to the dash of the car. The performance of the S-meter may now be checked by tuning in signals — either amateur or b.c. — and observing the deflection of the meter. If b.c. station signals cause only a small

deflection, it indicates that  $R_1$  is adjusted toward minimum sensitivity. In that case, readjust  $R_1$ , zero the meter by means of  $R_2$ , and try again. It is necessary to reset the zero-adjust control each time that the sensitivity control setting is altered. Of course, if signals tend to pin the meter, the sensitivity can be reduced by adjustment of  $R_1$ .

With 150 volts applied to the plates of the 12AX7, with the grid of  $V_{1A}$  grounded ( $R_1$  at minimum sensitivity position), and with the meter adjusted to zero, the tube should draw about 3.5 ma. The voltage at the two cathode terminals, Pins 3 and 8, should be 0.4 volts.

The field-strength meter can be most quickly tested by using the mobile transmitter as the source of signal. Either a short length of wire, the b.c. antenna, or an insulated fender guide<sup>2</sup> may be used as the r.f. pick-up. Just terminate the pick-up antenna at  $J_1$ , throw  $S_1$  to the proper position, adjust  $R_2$  for maximum resistance across the milliammeter, turn on the transmitter and watch the needle. Lengthen the pick-up antenna if the meter deflection is not great enough, or regulate the shunt,  $R_2$ , if the reading is too high. It is just as well to shorten the pick-up antenna a bit if the shunt resistance has to be lowered appreciably. Try and end up with an antenna length that serves the purpose as far as your own installation is concerned and also provides enough pick-up to permit making measurements of a more sensitive nature. The latter would include measuring the field strength from the mobile transmitter of a fellow ham who is parked alongside of your vehicle.

$L_1$  should ordinarily require adjustment only if the indicator is used for checking at 75 meters. In that case, it is advisable to increase the sensitivity to maximum by resonating the coil. Abel has explained why a tuned circuit is not required at the higher frequencies.

◆

The function switch is to the left of the zero-adjust control in this bottom view of the S-FS Indicator.  $R_1$  is at the rear of the unit, just below the 1-mh. r.f. choke.  $J_1$ , on the rear wall of the chassis, is a miniature nylon tip jack. The back cover for the metal box that normally encloses the meter is punched to clear the components mounted on the rear wall of the chassis.

◆

# A Low-Cost Code-Practice Oscillator

## A.C. Power with Safety Features

BY ROBERT E. FOLTZ,\* W9GBT

**I**N looking for a good design for a code-practice oscillator, certain requirements were established: The unit must be powered from the a.c. line yet provide complete isolation for safety; there should be no shock hazard in the keying circuit; and in addition, speaker operation was desired without added cost or circuit complication.

Units have been described using a filament transformer for the tube heaters, with the plate voltage obtained from batteries or a rectifier supply. A study of transformers available disclosed a type used in TV boosters having a plate winding of 110 to 150 volts at 15 to 25 ma., in addition to a filament winding, at a cost of only fifteen cents more than a single filament transformer.

A selenium rectifier was first considered for ob-

• Using a TV horizontal-oscillator coil in the oscillator circuit makes it possible to drive a speaker voice coil without a matching transformer. Combined with a "booster" transformer, the result is an inexpensive self-contained code-practice oscillator.

taining the necessary d.c. plate voltage, but further study indicated that a dual-triode tube would be more economical in both cost and space, by using one section as a half-wave rectifier and the other as the audio oscillator.

The ordinary audio-oscillator circuit calls for an audio interstage transformer, which accounts for a good portion of the total parts cost. In this design, a horizontal-oscillator coil, as employed in TV receivers, is used in the feed-back circuit. In addition to economy, the adjustable ferrite core provides the means for adjustment of tone without the added cost of the usual potentiometer.

The number of components in the circuit of Fig. 1 is small, as all frills were eliminated in the interests of simplicity and low cost. New parts as checked in a catalog total under \$6.00, not including the speaker or cabinet. Many of the parts can be found in special sale catalogs or at bargain counters at most of the larger supply houses. The parts for this particular unit, bargain-purchased, amounted to only \$4.03. An additional \$1.05 provided a 2-inch speaker.

### The Circuit

Referring to the circuit, it will be noted one triode section of the 12AU7 functions with grid and plate tied together as a half-wave rectifier. The 270-ohm resistor in the cathode lead limits

The author's oscillator is built in a plastic cabinet taken from a surplus electric-blanket control. The knob on the left is the a.c. switch; the key plug is inserted through the hole at the right.

# A 28-Mc. Civil Defense Package

*Three-Channel Fixed-Portable-Mobile Station for Emergency Use*

BY PHILIP S. RAND,\* WIDBM

• The three basic units — transmitter, receiver, power supply — of an emergency station have to be coordinated electrically as a matter of practical operation. Here's a "package" that carries the coordination still further, putting three identical-size units into a compact station that can be picked up and carried anywhere in one piece, yet which can readily be separated into components for separate use or servicing. Utility and appearance are combined without excessive cost.

THE EQUIPMENT to be described is the result of the efforts of three amateurs who joined together to solve a civil defense communications problem in a small Connecticut town. This same problem probably exists in hundreds of other small communities all over the country.

Redding, a rural community with a population of only about 2500, is situated in the hills of Connecticut about sixty miles northeast of New York City and about twenty miles northwest of Bridgeport, Connecticut. The people live in a number of small villages scattered throughout the town limits. Redding is one of the twenty-two towns and cities which constitute "Area One" of the State of Connecticut Civil Defense system. Area One is one of the most active civil defense areas of Connecticut. Unfortunately for Redding there are only three amateurs in the town, two of whom are already up to their ears in c.d. work at Area Headquarters.

One of the problems was how to organize an

efficient RACES program with only one ham available locally. Another problem was that of obtaining appropriate station equipment without any funds, because it was found that although Redding had the nucleus of a c.d. organization it was not active and there was no money for radio gear. The third problem was how to make the c.d. organization in Redding more active so it would take part in the weekly training exercises. It was sort of like the old question of which came first, the chicken or the egg: No c.d. activity, no communications; no communications with the rest of the area, no activity locally. Past experience with other towns in Area One had shown conclusively that if radio communications could be set up and maintained between an inactive town and Area Headquarters, interest in all branches of the local c.d. set-up was stimulated enough to spark the whole operation into life.

WIDBM, W1KGT and W1ODW held a meeting, procured an egg, and hatched out the following:

1) They formed a bona fide radio club with themselves and their XYLS as members and applied to FCC for a club radio station license. This station was to be the local c.d. station for contact with Area Headquarters and was to be located at c.d. headquarters in the Town Hall. FCC issued a station license, W1DUL.

2) Through notices in the newspapers, at the school and by word of mouth, they were able to get about ten new members for the radio club. All of the non-amateur members are obtaining Restricted Radiotelephone Permits from FCC, are being trained in RACES operating procedure, and will be used as operators.

3) W1ODW was appointed Redding Radio Officer by the local c.d. director, and he imme-

\* Redding Ridge, Conn.

(Left): The three units assembled in their carrier. Transmitter, receiver, and power supply are included in the "package." The outfit can run either on regular a.c. or on a 6-volt battery supply. The carrier is made from a cut-down ½-inch aluminum relay rack panel as a base, with aluminum uprights and crosspiece supporting the handle. Individual units are fastened to the base with screws. (Right): Rear view of the assembled station shows the converter mounted in place on the back of the receiver.

diately made out the necessary RACES application forms tying Redding into the Area and State RACES plan. These forms were forwarded to the State Radio Officer.

4) Redding had previously been assigned to the Area ten-meter net. W1DBM, W1KGT and W1ODW pooled ideas and parts and divided up the actual work in designing, constructing and installing a complete ten-meter c.d. station for the town. The station will, of course, be owned and operated by the Redding Radio Club, with one of the amateur members as Trustee.

When planning a RACES station like this, it must be kept in mind that it will take more than just one radio operator to man it. A typical c.d. set-up would require:

- a) one Communications Officer with three assistants or alternates (in charge of all types of communications);
- b) one Radio Officer with three alternates (in charge of all radio communications);
- c) three dispatchers;
- d) one chief operator in charge of all operators;
- e) one technician in charge of all equipment;
- f) four radio operators for each transmitter in use;
- g) at least four messengers for delivering messages.

This makes a total of twenty-four people for a one-transmitter station, a rather imposing list; however, all RACES stations should be organ-

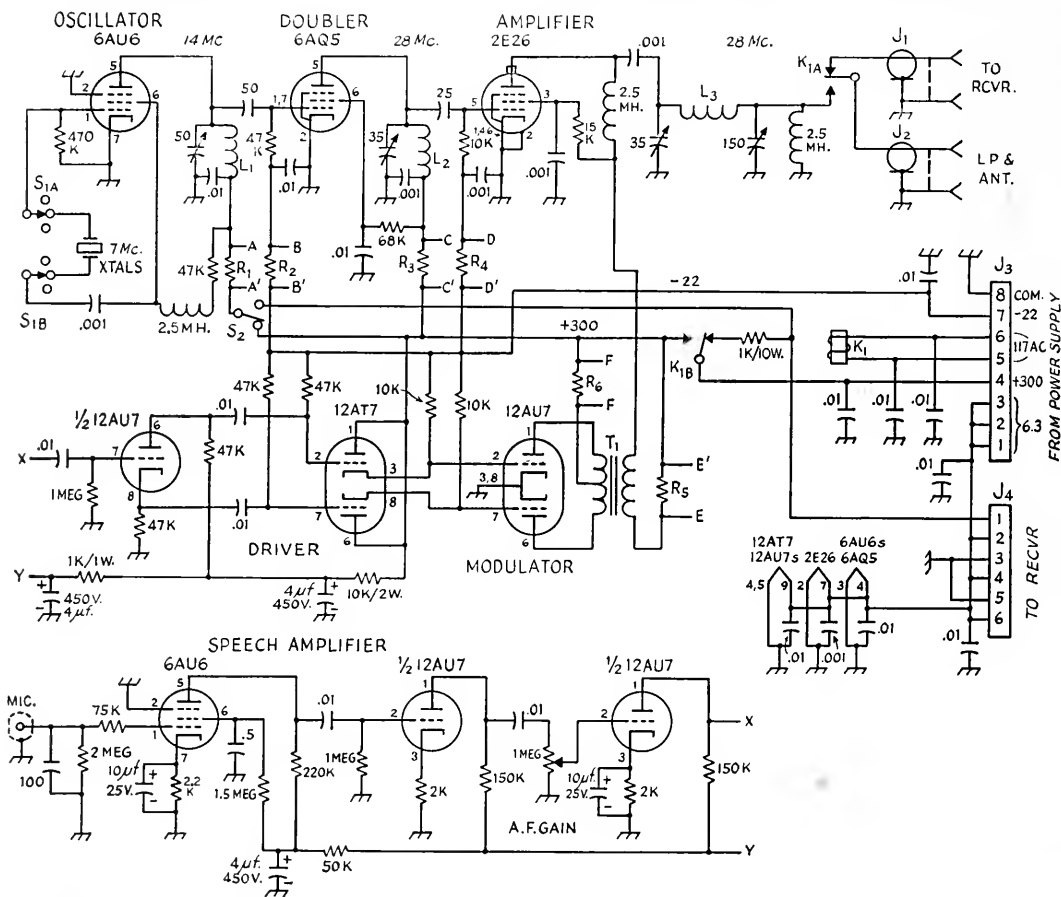

Fig. 1 — Circuit diagram of the transmitter and modulator. Capacitances below 0.001  $\mu$ f. are in  $\mu$ f. Fixed capacitors up to and including 0.01 are ceramic. Resistors are  $\frac{1}{2}$  watt unless otherwise indicated.

R<sub>1</sub>, R<sub>3</sub>, R<sub>5</sub>, R<sub>6</sub> — Meter shunt, for 100-ma. full scale (approximately 0.16 ohm, or approx. 5 ft. No. 24 enam. wound on 1-watt resistor).\*

R<sub>2</sub>, R<sub>4</sub> — Meter shunt, for 5-ma. full scale (25 ohms).\* L<sub>1</sub> — 4  $\mu$ h.; 20 turns No. 26 on  $\frac{1}{2}$ -inch diam. form, winding length 1 inch, slug-tuned.

L<sub>2</sub> — 1.5  $\mu$ h.; 14 turns No. 20 on  $\frac{3}{8}$ -inch diam. form, winding length 1 inch, slug-tuned.

L<sub>3</sub> — 1.3  $\mu$ h.; 9 turns No. 12, diameter  $1\frac{1}{8}$  inches, length  $1\frac{1}{4}$  inches, self-supporting.

J<sub>1</sub>, J<sub>2</sub> — Coaxial connectors, chassis type.

J<sub>3</sub> — 8-contact connector, chassis-mounting (octal).

J<sub>4</sub> — 6-contact connector, chassis-mounting (Jones).

K<sub>1</sub> — D.p.d.t. relay, 117-volt a.c. coil (Advance type AM/2C/115VA).

S<sub>1</sub> — Rotary switch, 2 poles, 3 positions.

S<sub>2</sub> — S.p.d.t. toggle.

T<sub>1</sub> — Modulation transformer, 10,000 ohms to 3000, 5000, or 8000 ohms (Triad type M-3X).

\* These values for a surplus meter taken from the r.f. indicator of ARC-5 equipment. Values should be adjusted to fit when other types of meters are used.

NOTE: Connections indicated by A-F and A'-F' inclusive go to corresponding letters on meter switch (in power-supply unit) through a 12-wire cable. Plug-and-socket wiring for the meter cable is omitted from these diagrams for simplification.

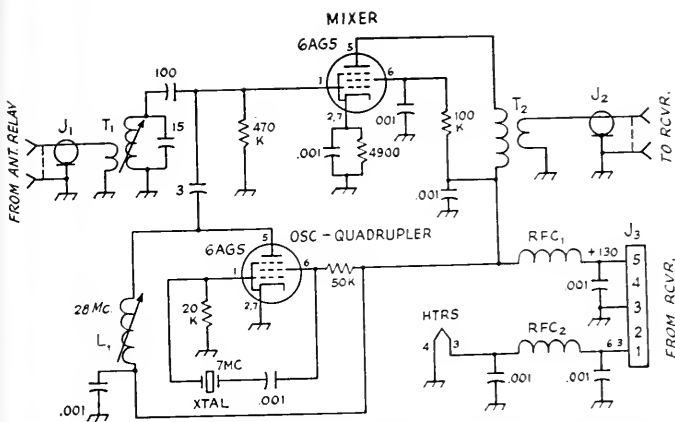

Fig. 2 — Crystal-controlled 28-Mc. converter. The 0.001- $\mu$ f. capacitors are disk ceramic; others may be either mica or ceramic. Capacitances below 0.001  $\mu$ f. are in  $\mu$ f. Resistors are  $\frac{1}{2}$  watt, carbon.

- L<sub>1</sub> — 16 turns No. 24 enam. close-wound on  $\frac{1}{2}$ -inch diam. slug-tuned form (National XR-50). Inductance adjusted to resonate with tube and stray capacitances at 4th harmonic of crystal.
- J<sub>1</sub>, J<sub>2</sub> — Coaxial connectors, chassis-mounting type.
- J<sub>3</sub> — 5-contact connector, male, chassis-mounting (5-prong plug).
- RFC<sub>1</sub> — 21  $\mu$ h. (Ohmite Z-28).
- RFC<sub>2</sub> — 7  $\mu$ h. (Ohmite Z-50 or 2-watt resistor wound full with No. 20 enam.).
- T<sub>1</sub> — Grid coil approx. 1.5  $\mu$ h.: 13 turns No. 24 enam. close-wound on  $\frac{1}{2}$ -inch diam. slug-tuned form (National XR-50). Antenna coil 4 turns wound at ground end of grid coil.
- T<sub>2</sub> — Untuned b.c.-band r.f. transformer (Miller 472-UA). Leads at ground ends of coils must be unsoldered and separated for making the connections shown above. See text for further modifications.

ized on this basis so they will be adequately staffed for continuous twenty-four-hour operation day after day. Also, bear in mind that if the time ever comes when c.d. communications are vitally needed, half of your personnel may be knocked out or otherwise unavailable, so you need plenty to start with. (Incidentally, all amateur stations not in RACES will be definitely off the air in the event of a national emergency resulting from enemy action.)

Fortunately for small towns with only a few hams, only the Radio Officer, his alternates and the technician need be licensed amateurs. The rest need only hold Restricted Radiotelephone Permits. RACES mobiles can be owned and operated by Restricted Permit holders, if need be.

### Transmitter

In the actual design of the equipment, it was first determined by a mobile test that a 15-watt transmitter with a 10-meter ground-plane antenna would be adequate to span the twelve airline miles from the Redding Town Hall to Area One Control. With this as a basis, it was possible to build a rig with a combination 120-volt a.c./6-volt d.c. power supply so that the transmitter could be independent of power failures. By the addition of a carrying handle, it could also be used as a portable or a mobile if need be.

Going on from this point, a simple yet effective r.f. unit was built and tested using a 6AU6 crystal oscillator followed by a 6AQ5 doubler and a 2E26

final amplifier. The circuit is shown in Fig. 1, along with the 12AU7 Class B modulator. There are three crystal frequencies available, one for the Area channel, one for the local channel and one for the statewide mobile support frequency. In the interests of good audio quality (which cuts down on repeats and fills in handling messages), a crystal microphone was selected and the necessary audio amplification was built in. The 12AU7 Class B modulator was chosen because of its low static plate current. The use of a cathode follower for a driver eliminated the need for a Class B driver transformer.

For simplicity in tuning and antenna loading, a pi network was used in the final plate circuit. The plate tuning and antenna loading controls are the only ones brought out to the front panel. The crystal-oscillator plate and doubler plate are tuned with a screwdriver through suitable holes in the top of the cabinet.

In addition to the crystal switch and the audio gain control, there is a s.p.d.t. toggle switch on the front panel for turning on the crystal oscillator alone so that the transmitter can be spotted on the receiver. This is a big help to inexperienced operators in locating the net frequency.

A small d.p.d.t. 120-volt a.c. relay shifts both the antenna and B-plus from the receiver to the transmitter when the send-receive switch is thrown. This relay is connected to the 120-volt winding on the transformer so that it works regardless of whether a.c. or battery is being used for primary power.

### Receiver

Many ideas on receivers were discussed and rejected, including using a BC-348, a 312, or an ARC-5 with a tunable converter, or rebuilding a junked ham receiver. The amount of work involved in designing and building a complete 10-meter receiver with a good noise limiter, adequate stability, sensitivity, bandspread, and so on, was a little frightening. A good solution finally came when some 144-Mc. technique was borrowed, resulting in a simple crystal-controlled converter ahead of a homemade broadcast receiver. Fig. 2 shows the circuit of the converter, which uses a 7-Mc. crystal and a pair of 6AG5s. Fig. 3 gives the circuit of the tunable i.f. amplifier (540 kc. to 1750 kc.). This has the useful feature that the homemade dial can be calibrated in both 10-meter frequencies and b.c.-band frequencies, and if the

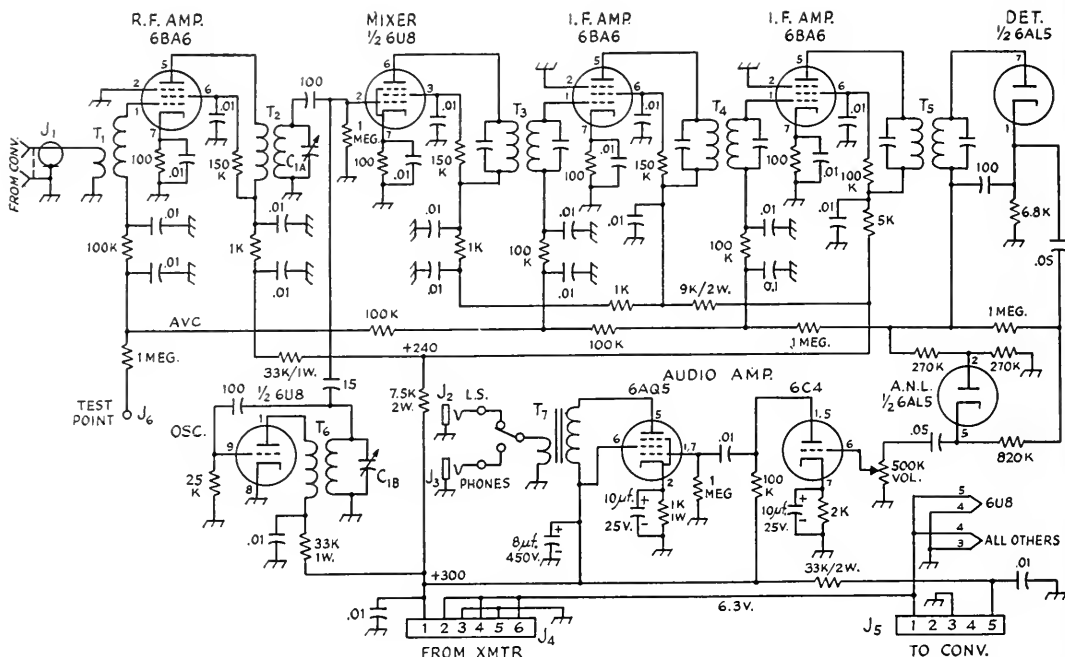

Fig. 3 — Circuit of b.c.-band receiver used with crystal-controlled 28-Mc. converter. Capacitances below 0.001  $\mu$ f. are in  $\mu$ f. Fixed capacitors to 0.01  $\mu$ f. are ceramic. Resistors  $\frac{1}{2}$  watt unless specified otherwise.

C<sub>1</sub> — Two-gang b.c.-receiver tuning capacitor.

J<sub>1</sub> — Coaxial connector, chassis-mounting type.

J<sub>2</sub>, J<sub>3</sub> — Single-circuit 'phone jack.

J<sub>4</sub> — 6-contact connector, chassis-mounting (Jones).

J<sub>5</sub> — 5-contact connector, chassis-mounting (5-prong socket).

J<sub>6</sub> — Pin jack.

T<sub>1</sub> — B.c. antenna coil, untuned (Miller 472-UA modified as described in text).

T<sub>2</sub> — B.c. r.f. coil assembly (Miller 242-RF).

T<sub>3</sub> — 455-kc. i.f. transformer, input type (Miller 012-C1).

T<sub>4</sub> — 455-kc. i.f. transformer, interstage type (Miller 012-C2).

T<sub>5</sub> — 455-kc. i.f. transformer, diode type (Miller 012-C4).

T<sub>6</sub> — B.c. oscillator coil assembly (Meissner 14-4243).

T<sub>7</sub> — Audio output, 4-watt universal type (Stancor A-3856).

NOTE: I.f. transformers, T<sub>3</sub>–T<sub>5</sub>, inclusive, tuned to following frequencies:

Trans.	Pri.	Sec.
T <sub>3</sub>	460 kc.	450 kc.
T <sub>4</sub>	445	465
T <sub>5</sub>	460	455

need arises the converter can be unplugged and the Conelrad channels, 640 kc. and 1240 kc., can be received. These are both marked on the paper dial. Also, other crystal converters, such as for 144 or 50 Mc., can be plugged in either for regular use or for monitoring purposes. The tuning range is about 1210 kc., or from approximately 28.5 to 29.7 Mc. This same range would apply on either 6 or 2 meters, so an appropriate crystal would have to be used in these converters to cover the desired 1.2-Mc. portion of the band.

The untuned r.f. stage used in the broadcast tuner was found necessary to prevent birdies resulting from the two oscillators beating together in the mixer grid circuit. It is recommended that anyone building a similar receiver use a tuned stage of r.f. with a three-gang capacitor instead of the two-gang unit we used. When we discovered the birdies it was too late to install the three-gang condenser, so we did the next best thing and isolated the two oscillators with the untuned stage.

A 6U8 was used as an oscillator-mixer because one was available. A 6BE6, or another type of converter, could have been used just as well.

Two stages of 455-kc. i.f. were used to provide enough gain so that the i.f. transformers could be stagger tuned for a broader passband, making tuning easier for inexperienced operators.

The second detector, a 6AL5, also provides a.v.c. and noise limiting. The audio is conventional, except that a s.p.d.t. toggle switch allows switching from 'phones to loudspeaker when needed. Normally all reception is with 'phones in c.d. work.

### Power Supply

A schematic of the power supply is shown in Fig. 4. A combination a.c./vibrator transformer is used so that primary power can be either regular a.c. or 6 volts d.c. By using 12-contact power plugs, the selection between a.c. and d.c. is made simply by plugging in the proper plug. When the d.c. cable is plugged in the vibrator is automatically connected in the circuit.

The circuit is straightforward, except perhaps for the use of selenium rectifiers. These were used in order to save 2 amp. that would have been needed for heating the rectifier filaments if tube rectifiers had been used. Four 200-ma. selenium

units were used in each stack because they were available; three 75-ma. units could have been used just as well.

The fixed bias, -22 volts, for the r.f. and modulator is obtained from the drop across a 200-ohm 25-watt adjustable resistor in the transformer center tap. This robs 22 volts from the high voltage; however, the drop in plate voltage is not missed, and the system is better than replacing "C" batteries.

### Construction

As can be seen from the photographs, the entire station is made up of three small units. This was done for ease of construction and servicing. In use, these units are all bolted to a common bottom or base plate which is equipped with a carrying handle. In the front-view photograph the transmitter unit is on the left, the receiver is in the center, and the power supply is on the right. The crystal-controlled 28-Mc. converter is attached to the rear of the main receiver and the low-pass filter is tucked in back of the transmitter.

In actual use in the Town Hall, the complete set-up is housed in a plywood cabinet with a hinged door that can be either locked when not in use or can be dropped down for use as an operating table. There are shelves and compartments for the microphone, headsets, logbook, message pads, and similar accessories.

The crystal converter is built in a  $3 \times 4 \times 5$ -

inch utility box with the components mounted on one of the covers. This box is attached with small aluminum brackets to the top rear of the main receiver.

The transmitter, receiver and power supply are each constructed on a standard  $3 \times 5 \times 10$ -inch aluminum chassis equipped with homemade front and rear panels 8 inches high. The panels have  $\frac{1}{2}$ -inch lips folded over so that the perforated aluminum sheet (Reynolds "do-it-yourself" material now available in most hardware stores) for the shielding can be secured with sheet metal screws. In our case we completed all three cabinets (all holes drilled and punched) and then, after assembling them, sprayed them with grey wrinkle enamel. Baking under some infrared heat lamps finished the paint job. Next, Tekni-Label decals were applied and the result was a professional-looking job.

On the transmitter chassis the speech amplifier tubes are across the rear, separated by the modulation transformer from the r.f. The crystal oscillator is in the center of the chassis and the final amplifier is toward the front panel. The antenna relay is just behind the antenna loading condenser.

The two coax cables from the connectors on the rear panel run to a bracket just behind the relay. One of these goes to the antenna and one to the converter.

Because of lack of space in the r.f. unit, the

E1—Vibrator (Mallory type 294).

meter and the meter switch are both located in the power supply and a 12-wire cable interconnects these two units. The meter shunts, however, are in the transmitter. These must be tailored to fit the particular meter.

The vibrator and the filter condenser can be mounted along the rear edge of the power supply chassis. The power transformer occupies most of the space in the middle. The selenium rectifiers are mounted on two 5-inch 6-32 threaded rods between two aluminum end brackets, toward the front just behind the 2-inch milliammeter. The filter choke is mounted under the chassis in the center while the r.f. choke for the battery lead is just to the rear.

Note that all terminals of the output cable sockets are by-passed with 0.001 disk ceramic capacitors. In the transmitter unit this keeps TV harmonics from escaping, while in the power supply it keeps vibrator hash in its place. In the receiver it helps to keep the two oscillators from beating together. This by-passing also helps to keep broadcast signals from entering the receiver via the power leads. These precautions may not be needed in every installation, but since it was easier to put the by-passes on before installing the sockets we put them on "just in case." All 0.001 and 0.01 capacitors are of the disk ceramic type, including the audio coupling units. This makes for a very neat and compact wiring job.

In laying out the receiver chassis, the tuning capacitor had to be mounted slightly off center to allow room for the shield cans of the r.f., mixer and oscillator coils which line up on the left. The i.f. transformers and tubes are along the right side, with the two audio tubes on the rear edge. Miscellaneous components are grouped on terminal boards on either side under the chassis. The volume control is mounted on a small bracket toward the rear so as to be near the first audio stage. The audio output transformer is mounted near the output tube, with shielded leads running to the 'phones-speaker switch up front and thence back to the two jacks.

The dial was made by cutting and filing an

aluminum frame to mount over white cardboard on which the frequencies were lettered in India ink. The knob itself is one from the junk box with a celluloid pointer attached. A vernier action dial would be more suitable, if available.

The i.f. output coil of the converter is a broadcast-band untuned antenna coil hooked up in reverse. If the builder should use this same coil, it will be necessary to separate the two windings, the ground ends of which are both soldered to the same lug on the coil form, and connect the antenna-winding lead to the spare lug. This prevents B-plus from appearing on the output winding. It was found that this particular coil resonated near 600 kc., so about half the turns were removed from the "grid" winding and the output was much more uniform across the 10-meter band. These same modifications were made to the untuned r.f. stage in the receiver proper, to make the coil tune better and to avoid shorting out the a.v.c. Before removing turns it is well to check the receiver response to see if such modification will be necessary.

The interconnecting power and coax cables all connect to the rear of the chassis and are about 24 inches long so that the various units may be readily separated and turned upside down for testing and servicing.

### Testing

After all four units are assembled and wired, the power supply should be tested first. Check the circuit over before turning on the power, to be sure there are no mistakes or shorts. Remember that the negative side of the filter capacitors goes to the -22 volts, not to ground; there will be a bad a.c. hum in the audio if the capacitors are grounded. With no load the B-plus voltage will run around 400 or higher, but with full load on transmitting it is down to about 300 volts.

The voltage during receiving runs about 350 volts but is reduced in the receiver by the rather high values of decoupling resistors used in addition to a series resistor in the transmitter unit.

Alignment of the receiver follows usual prac-

Top view of the three units with covers off; transmitter at right, receiver in center, and power supply at left. Layout details are discussed in the text.

The perforation pattern on the bent-over edges of the front and rear panels results from spray-painting the cases with the covers in place. This avoids necessity for subsequent scraping of paint to make good electrical contact with the perforated shields.

\* Without speech input.

The receiver section has too much gain with the i.f. transformers tuned on the nose and the full power supply voltage applied, so some trouble from oscillation may result if one attempts to operate it in that fashion. As pointed out earlier, large decoupling resistors were intentionally used to drop the plate voltage, and the i.f. transformers were stagger-tuned to increase the i.f. bandpass for easier tuning.

The two oscillators, one in the converter and one in the receiver, should both be operated at as low a value of plate voltage as is consistent with good mixing. This keeps the amplitude of any beats or birdies as low as possible, birdies always being a problem in double-conversion receivers. A final check should be made, after the unit is operating, to

tice. Feed a signal from a signal generator at 455 kc. into the last i.f. grid and align  $T_5$  first, then work toward the mixer one stage at a time, reducing the output of the signal generator each time so that nothing overloads. A vacuum-tube voltmeter plugged into the a.v.c. test jack makes both a good S-meter and an alignment indicator. The i.f. should be stagger-tuned according to the frequencies given in the caption for Fig. 3.

After aligning the i.f., proceed with the r.f. and mixer stages. When the receiver proper is lined up so that it works well on the broadcast band, the converter may be tested. Check the two r.f. coils with a grid-dip meter after they are wired, but with the tube filaments turned off. The crystal-oscillator plate coil should dip at around 28 Mc. while the mixer coil should show resonance at about 29 Mc.

make sure that the voltages at each tube socket are near those given in Table I. If they differ appreciably, the appropriate resistors should be changed accordingly.

The transmitter coils should be checked with a grid-dip meter to be sure they tune to the right frequencies — the oscillator coil to 14.5 Mc., and the doubler and final coils to 29 Mc. — with their condensers about one-half capacitance. If the transmitter is tuned up on 29.5 Mc., 7-Mc. crystals giving output frequencies from 29.4 to 29.6 may be switched in without any retuning. If you plan to use widely separated frequencies it will be necessary to retune all stages when switching crystals.

No trouble was experienced in getting the transmitter on the air. However, there was a

(Continued on page 112)

Cable connections all terminate at the rear of the chassis (bottom in this underside view). Audio controls are equipped with extension shafts so they can be mounted near the associated tubes and thus avoid undue hum pick-up on leads. If normal wiring and layout practices are observed, there are no critical points other than those mentioned in the text.

# A 500-Watt 144-Mc. Amplifier

*High Efficiency at Moderate Cost with War-Surplus Triodes*

BY LEONARD F. GARRETT,\* W7JIP

THE idea of running high power is attractive to many 2-meter men, but the cost of the tubes and other components often proves to be a stumbling block. The amplifier described here doesn't quite make the kilowatt level, but it will handle 500 watts with ease, and with good efficiency. It is built around surplus HK-54s that were purchased for two dollars each, so the total cost is far below that for a tetrode amplifier of similar power level using new tubes.

Much of the "low-drive" advantage of tetrodes fades when they are used at frequencies near the maximum at which they are capable of operating with reasonable efficiency. A 9903 or an 829-B

is customarily used to drive high-powered tetrode amplifiers on 144 Mc., and this triode amplifier will get along nicely with the same. The 9903 driver here runs at 105 watts input (700 volts at 150 ma.) and this furnishes 50 ma. grid current and 270 volts bias. The final stage will operate satisfactorily with grid current as low as 35 ma., so an 829-B should handle the job without exceeding its normal c.w. ratings.

## Design Considerations

In laying out a high-powered amplifier that requires conventional cross-over neutralization, symmetry and short leads are mandatory. The top-view photograph shows how these ends are

served. Standard components were used wherever possible, the only handmade items being the grid coil, the plate line, and the blower trough. The last item doubles as a submount for the tube sockets and furnishes a low-inductance return for the filament by-passes.

Considerable time was spent experimenting with various filament by-pass arrangements, with the result as shown in the view of the blower trough and the filament wiring. Silver-mica button by-passes were mounted close to each filament pin, and the leads to the filament transformer were wound up into r.f. chokes. Using a grid-dip meter as an r.f. indicator, very little r.f. can be found in the filament circuit, and achieving this end helped considerably with the grid-drive problem. With ineffective filament by-passing the final stage was harder to drive; that is, more driver output was needed for a given final stage grid current.

Similar thought was given to plate by-passing. Checks on all available high-voltage by-passes showed series resonance at 30 to

60 Mc., so their effectiveness at 144 Mc. is rather doubtful. The amplifier is operated without apparent r.f. return in the plate circuit, as the rotor of the tank capacitor is floating and there is an r.f. choke at the mid-point of the plate line. This is a satisfactory arrangement with push-pull amplifiers and  $RFC_4$  does an adequate job of keeping r.f. energy out of the power leads.

### Mechanical Work

Details of the parts of the amplifier that must be made are best explained by the drawings and photographs. It will be seen that the cooling fan is mounted on the rear wall of the chassis. Its flow of air is directed around the tube bases by the copper trough, Fig. 2, the opposite end of which is closed off. Eight quarter-inch holes are drilled in the chassis around each tube, and a small baffle plate is inserted in the trough midway between the two sockets to equalize the flow of air to each tube. The fan is a Dayton type 1C180, supplying approximately 50 cubic feet per minute.

In making the plate tank circuit no soldering is done. The entire assembly is bolted together, and all components are silver-plated. The line is somewhat longer than necessary, and a shorting bar is provided so that its electrical length can be adjusted. Details of the shorting bar, the supports for the end of the line, and the contact straps that connect to the tuning capacitor are given in Fig. 3 (page 116).

The brass end fittings are mounted on ceramic stand-offs  $3\frac{1}{2}$  inches high (Millen 31004). The output coupling link is supported on 3-inch lengths of polystyrene rod,  $\frac{5}{8}$  inch in diameter. Tank capacitor supports are 3-inch ceramic standoffs. The neutralizing capacitors are held  $\frac{3}{4}$

inch above the chassis on ceramic cone insulators. The chassis is 11 by 17 by 3 inches.

#### Operation

Neutralization of the amplifier is completely conventional, following procedure used on lower frequencies. It was found simpler to neutralize the rig when the lead from the high-voltage power supply was disconnected completely. Otherwise, self-rectification takes place in the tubes when grid drive is applied, and plate current will flow

in the final due to the d.c. return path through the power supply.

All the customary checks on neutralizing apply. If the layout is symmetrical, the gap in the neutralizing capacitors will be the same. Grid current dip, when the plate is tuned to resonance, will be one milliamperere or less. With plate voltage applied, plate and grid current will drop to zero if drive is removed, regardless of the setting of the grid or plate tuning capacitors. In operating

# A Miniature Mobile Antenna

*Using the B.C. Whip for Ham Work*

BY ROBERT J. BONEBRAKE,\* W9GCCQ

THE reason often given for using an arrangement such as the one about to be described — “The XYL won’t allow holes drilled in the car” — would probably be sufficient in this case also. However, in this instance there were additional considerations. Originally, a permanent mobile rig was not installed in the family automobile because we contemplated buying a new one in the not-too-distant future. A few months ago we were building a small self-contained all-band battery- or a.c./d.c.-powered receiver and transmitter for portable use. Having always had the desire to operate mobile, the idea was conceived that it should be possible to use the portable rig in the car, using either its self-contained batteries or an inverter to produce 115 volts a.c. from the 6-volt car battery. This would make possible the use of the small rig as both a portable and mobile rig, except for one problem — what to use for a mobile antenna. Since the rig would not be in the car permanently, it did not seem worth while to mount a permanent center- or base-loaded antenna on the car. Yet to get any power into the antenna it must be resonant, and

\* 3027 Memphis Street, El Paso, Texas.

• If there are objections to the mounting of the conventional 8-ft. transmitting antenna on the family car, W9GCCQ tells here how to make use of the standard b.c. antenna for mobile operation.

the ordinary auto antenna is not long enough to resonate at any frequency lower than the 50-Mc. band.

Thus it was decided to use the existing auto antenna, fully collapsed, as the bottom section of a center-loaded whip. The rest of the antenna consists of a center insulated section on which are mounted banana jacks for plug-in loading coils, and a top section made of a standard auto antenna. The center section is connected to the top and bottom antenna sections by two  $\frac{5}{16}$ - to  $\frac{1}{4}$ -inch copper-tubing reducer fittings. Thus the center insulated section and the top section can be quickly attached to or removed from the car antenna.

It might be pointed out at this time that in any mobile installation where it is desired to use the existing auto antenna on the converter, this loading-coil arrangement can be used to advantage. On 40 meters and 20 meters, signals which are unreadable using the standard auto antenna become S9-plus when the extension is attached and the proper loading coil plugged in. In our case, since the portable transmitter has a very low-power output, separate loading coils were made for each band in the interest of highest possible efficiency. However, if the antenna were to be used only for receiving, the coil could be made sufficiently large for use on the lowest-frequency band to be used, and tapped down for the higher-frequency bands.

## Construction

The construction of the center insulated section is shown in the drawing and photographs. It was made entirely from readily available parts, since

The miniature mobile antenna with the loading coil in place.

The center loading section connected to the b.c. antenna, with the 40-meter coil in place. At the risk of somewhat lower efficiency, this single coil could be tapped for use on the higher-frequency bands.

we did not have tools or materials to do any machining of connectors, tapping of polystyrene, etc. Undoubtedly, anyone with proper equipment could produce a better center section from a mechanical standpoint.

The bottom section of ordinary automobile antennas is approximately  $\frac{5}{16}$ -inch in diameter, and makes a fairly close fit into the  $\frac{5}{16}$ -inch end of the reducer fitting. The outside diameter of the  $\frac{1}{4}$ -inch end of the fittings is smaller, thus providing a larger shoulder to bear against the end plate when the retaining nut is tightened.

In normal use of the copper-tubing fittings, the nut is tightened until the copper compression ring is compressed tightly against the tubing, thus producing a leakproof seal. In our application, the ring cannot be compressed enough because the antenna tubing is slightly smaller than ordinary  $\frac{3}{16}$ -inch copper tubing. Even if it could be,

it would be impossible to remove it easily when taking the extension piece from the car antenna. Therefore, since the joint does not have to be leakproof, the compression rings can be split lengthwise on one side with a hacksaw. Then, when the nut is tightened, the ring can compress around the antenna, closing the slot made with the hacksaw, and clamping tightly to the antenna. The copper compression rings should not be used in the ends of the reducer fittings that fasten permanently to the end plates.

To provide more rigidity where the insulated center section clamps to the bottom antenna section, a 1/4-inch brass shaft coupling is soldered or brazed to the nut on the 1/4-inch side of the bottom reducer fitting. When connecting the insulated section to the auto antenna, the center section of the auto antenna is allowed to extend up through the shaft coupling, and the set screws are tightened down on it.

The side pieces are made from  $\frac{1}{4}$ -inch polystyrene. Polystyrene makes a good insulator at radio frequencies, but it has a tendency to discolor when exposed to sunlight for long periods of time, and also may crack when subjected to high pressures. Therefore, it is suggested that other types of insulating materials may be better for this application. However, we have used this antenna for several months and no serious ill effects have been noted. We have found that if the polystyrene is heated slightly at the points where pressure is applied to it, the cracking will be minimized. For example, after the polystyrene pieces have been bolted to the end plates, the bolts can be heated slightly with a soldering iron. Too much heat, of course, will cause excessive melting of the polystyrene.

The end plates on which the reducer fittings are mounted are made of 16-gauge cadmium-plated sheet metal. Sheet brass, if available, would be better due to its increased conductivity and resistance to corrosion. If the dimensions given in the drawing are followed, the unit must be assembled in the following sequence after all holes have been drilled: First, solder the banana jacks to the end plates and bolt the polystyrene to that side of each plate. Then put the reducer fittings on and bolt the other piece of polystyrene in.

The top section of the antenna is a standard

Fig. 1 — Sketch showing details of the loading-coil plug-in mounting.

64-inch 3-section telescoping side-cowl-mounting type auto antenna, available at most auto parts stores.

Loading Coils

To date, we have made loading coils for 40, 20, and 10 meters. (A small coil is necessary for 10 because the total length of the antenna is not quite  $\frac{1}{4}$  wavelength.) The coils are made from B & W inductors, as shown in the table. After determining the proper number of turns for each coil, the coil was cut and mounted on a  $3\frac{3}{4} \times \frac{3}{4}$ -inch piece of  $\frac{3}{16}$ -inch polystyrene, using Polyweld 912 coil dope, and banana plugs. The type of construction can be seen in the photographs. The coils were adjusted by starting with too much inductance, and decreasing the size one turn at a time, tapping the coil with a small alligator clip. Indication of the proper inductance was obtained by observing the S meter of a receiver each time the tap was changed. The receiver was located

The loading coils are mounted on polystyrene strips fitted with banana plugs.

about 100 feet away, with the antenna terminals grounded. The size of the coils given in the table should be fairly accurate for any installation, provided the length of the two antenna sections is the same as ours — 64 inches above the coil, and 20 inches below. The length of antenna above the coil has the most effect on the required inductance, longer lengths requiring less inductance. The antenna in our installation is fed through  $5\frac{1}{2}$  feet of coaxial cable by a link on the final tank coil. The cable consists of the regular auto antenna lead-in, plus a 3-foot extension made of RG-59/U.

Results

The over-all efficiency of the antenna seems to be quite good. Two-way checks have been made with a fixed station using a nondirectional an-

tenna, and distances of 4 miles have been covered using  $\frac{1}{2}$ -watt input to the final amplifier in the mobile rig.

Although it may seem that the added weight of the loading coil and antenna extension might cause undue strain on the auto antenna and its mount, we have used this arrangement for several months with no apparent damage. Since it takes but a matter of seconds to remove the extension from the auto antenna, or to telescope the top section down, it can easily be lowered when putting the car in a low garage or driving through low wooded areas. For even greater flexibility, if desired, the top extension could be connected to the center insulated section by means of a flexible mounting spring, similar to the type that is now on the market for that purpose.

# Simple Single-Band Preamplifiers

*More Gain for the Receiver*

BY W. W. DEANE, \* W6RET

• The author found that this little fixed-tuned preamplifier helped a lot in pulling in State-side signals on his 75A-1 while he was in the South Pacific. It can be duplicated with a handful of parts and a couple of spare hours.

**O**CCASIONALLY we all wish we could get a little more gain out of the receiver, particularly one not employing an r.f. stage. A very satisfactory way to improve the gain is to add an r.f. preamplifier ahead of the receiver. The ultimate, of course, would be a bandswitching unit to cover all bands. However, the majority of hams seem to confine their operations to one or two bands, and the cost and complexity of constructing a switchable unit makes it desirable to utilize a simple preamplifier confined to a single band. Fig. 1 illustrates a preamplifier for any one band from 80 to 10 meters. It requires a minimum of parts, expenditure, or labor, and will pay big dividends in bringing in a lot of heretofore unheard signals.

## Construction

In the model illustrated, a 6AK5 tube was used, but there are several different tubes that could be substituted, such as the 6AG5, 6CB6, 6BC5, 6BH6, or 6AU6. It should be noted that all of the above tubes are not direct replacements for the 6AK5, and a tube manual should be consulted

\* 4524 Fountain Ave., Los Angeles, Calif.

for proper pin connections.

The unit is constructed in a  $2\frac{1}{4} \times 1\frac{1}{2} \times 1\frac{3}{8}$ -inch Minibox. Provisions are made to switch the preamplifier in or out of the circuit with a d.p.d.t. slide switch. A phono jack is placed at either end of the box for the antenna input, and the output to the receiver. All coils are wound on  $\frac{3}{8}$ -inch Cambridge LS-3 type coil forms which have iron slugs. A small shield may be placed

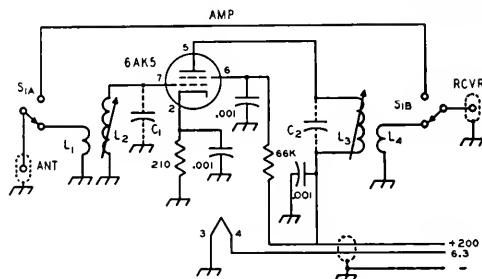

Fig. 1—Circuit of the miniature preamplifier. All 0.001- $\mu$ f. capacitors are disk ceramic.  $C_1$  and  $C_2$ , when used, are 20- $\mu$ f. low temp. mica or ceramic (see table).

across the tube socket to eliminate any interaction between the grid and plate coils. In the model illustrated the shield has been removed to allow better presentation of the parts lay-out.

A power source of 150 to 200 volts d.c. at 10 ma. and 6.3 volts at 0.3 amperes is required to

Fig. 2—Circuit of a simple power supply for the miniature preamplifier.  $T_1$  is a small TV booster transformer delivering 125 volts at 15 ma., and 6.3 volts at 0.6 amp. (Stancor PS8415)

operate the unit. This can normally be taken from the receiver, except in cases where the tube filaments are wired in series to operate directly from 115 volts. In the latter case, a small power supply, similar to Fig. 2, may be constructed. If the d.c. voltage is in excess of 200 v., a resistor should be placed in series with the B-plus lead.

## Alignment

After the unit has been assembled and wired, the coils may first be set to approximate fre-

# 807s in a 150-Watt Bandswitching Rig

*Operating Convenience with Medium Power*

BY GEORGE G. SYMES, JR.,\* W3WXP/Ø

• This 150-watt transmitter has a number of attractive features. Provision is made for both crystal and VFO operation. The VFO and multiplier stages are gang-tuned, and a multiband tuner requiring no switching is used in the parallel 807 final. Other features include a metering system, excitation control, and a built-in power supply for the driver stages. The only external unit required is the power supply for the final.

Not long ago, after a shutdown of some 12 years, I moved into quarters that permitted resumption of ham activities. The old 6L6-807 band-switching rig, quite modern when it was built 15 years ago, was dusted off, fired up and put on the air. After replacing a few small parts (casualties of a 5-year storage in sea air), and refreshing my memory on its peculiarities, it gave a good account of itself. However, passage of time showed up two serious drawbacks. The yield of QSOs in proportion to the number of calls using crystal control was very disappointing, and TVI restricted operation to almost impossible hours.

The quickest solution seemed at first to lie in an alteration of the old rig. But the more I thought about adding an external VFO, fitting shielding, installing by-passes, v.h.f. filters and shielded wiring in already restricted space, the more it seemed desirable to rebuild completely so that many ideas accumulated over later years could be included. Consequently, the rig shown in the photographs was born.

The circuit, shown in Fig. 1, is a result of browsing through the ARRL *Handbook* and issues of *QST* for the last few years. Either a 6AG7

\*% A. G. T. Eng. Dept., Personnel and Planning Sec., Westinghouse Elec. Corp., Kansas City, Mo.

The 150-watt band-switching transmitter and its high-voltage supply. The standard rack panel is 8¾ inches high (see text). Grouped to the left are  $MA_2$ ,  $S_5$  (see text), the National AM dial for  $C_{16}$ , and controls for  $C_{17}$  and  $S_3$ . Below the National ACN dial for the exciter gang are controls for  $R_1$ ,  $S_2$ , and  $S_1$ . To the right are  $MA_1$ ,  $S_4$ , and the two low-voltage power-supply switches.

Clapp VFO covering 1.6 to 2 Mc. (to include the 11-meter band), or an 80-meter Pierce crystal oscillator may be switched ( $S_{1A}$ ) to feed a 6AG7 buffer doubler followed by a string of 6AQ5 frequency multipliers covering 80 through 10 meters. Each stage (excepting the one covering 14 and 21 Mc.) covers only one band and therefore is more easily stabilized and adjusted for optimum performance than a stage required to cover several bands.  $S_{1B}$  and  $S_{1C}$  remove screen and plate voltages from the idle oscillator. These voltages are held constant by VR tubes in the low-voltage power supply included in the assembly.

The output of any multiplier stage may be switched ( $S_{2A}$ — $S_{2D}$ ) to feed a final using a pair of 807s in parallel. (6146s could be substituted with a saving in space, although some details might have to be altered.)  $S_{2E}$  removes plate and screen voltages from the idle multiplier stages. The multiplier stages are tuned simultaneously with the VFO by ganging their tuning capacitors ( $C_{1A}$ — $C_{1E}$ ) to the VFO frequency control. Thus, the tuning controls are reduced to three, including the output coupling control.

The 6AG7 amplifier-doubler doubles frequency only when working from the 1.6–2-Mc. VFO. Crystals in the 3.5-Mc. region are used in the crystal oscillator, although 160-meter crystals may be used if they are on hand. The 6AQ5 doubler-tripler is shifted from 14 to 21 Mc. by switching  $L_5$  in parallel with the 14-Mc. inductor,  $L_4$ , thus reducing the effective inductance for the higher-frequency band.

$C_2$ ,  $C_6$ ,  $C_8$ ,  $C_{10}$ ,  $C_{12}$ , and the adjustable slugs in the multiplier plate inductors provide convenience in adjusting the tracking of the multiplier circuits.  $C_7$ ,  $C_9$  and  $C_{11}$  are included so that the circuit capacitances will remain the same whether a multiplier stage is working into the final amplifier or into the following multiplier

stage. This is necessary to preserve tracking.<sup>1</sup> The potentiometer  $R_1$  in the screen circuit of the 6AG7 buffer-doubler is used to adjust excitation and is a convenience no rig should be without.

When the rig was first fired up, the 6AG7 buffer-doubler oscillated. This instability was eliminated by connecting a second by-pass,  $C_6$ , shown in dotted lines, at the cathode, and experimentally grounding it at various points on the chassis until the right spot was found. Slight differences in wiring or layout may make this unnecessary. Another oscillation showed up in the 40-meter 6AQ5 stage. This was cured by a 1-turn neutralizing link, also shown in dotted lines. This link may or may not be required in every case.

<sup>1</sup> At 10 meters, the reactance of the parasitic chokes used (1  $\mu$ h.) becomes appreciable relative to the reactance of  $C_{13}$  and  $C_{14}$  plus the tube input capacitance. This tends to increase considerably the apparent capacitance across the circuit, and this is probably the reason that the 50- $\mu$ mf. variable capacitor was found necessary to cover the 10-meter band. It should be possible to eliminate v.h.f. parasitic oscillation without the use of the grid chokes (see recent editions of *The Radio Amateur's Handbook*). With the chokes removed, capacitor values the same as those used in the 40- and 20-meter stages should be adequate with an appropriate increase in tank inductance. — Ed.

<sup>2</sup> See QST, July, 1954.

<sup>3</sup> It is advisable to use a rotary switch at this point, since the switch must stand the full 807 plate voltage. — Ed.

To avoid switching in the final amplifier, a multiband tuner<sup>2</sup> is used in the output tank circuit.  $S_3$  selects a proper proportion of the output coupling inductor,  $L_{12}$ , depending on the output frequency.  $C_{17}$  is the output coupling control.  $L_7$ ,  $L_8$ ,  $L_9$ ,  $C_{13}$  and  $C_{14}$  were installed to suppress parasitic oscillation. The two capacitors are also an aid in reducing TVI. The 807s are protected by a 6L6 screen clamper.  $S_5$ <sup>3</sup> grounds the screens while tuning up the exciter.

Two milliammeters are included. A 10-ma. unit,  $MA_1$ , may be switched to read either final grid current or total exciter current. The resistor  $R_2$  is a 20-times shunt to increase the full-scale reading to 200 ma. The shunt was made from copper wire as described in the measurements chapter of the ARRL *Handbook*. The second meter, a 300-ma. unit, reads combined plate and screen currents to the 807s.

All power leads are of shielded wire, and have filters for the operating frequency as well as for v.h.f. The low-frequency filtering may not be strictly necessary, but it does help to keep fundamental r.f. out of the power supply and off the a.c. line where rectification might take place, resulting in the generation of TVI.

### Construction

A system of permanent yet flexible construction was found in building the exciter, final amplifier and low-voltage power supply as separate units. Any of these may be quickly removed from the assembly for replacement, rebuilding or use elsewhere. A pair of 5  $\times$  13  $\times$  3-inch chassis takes care of the low-voltage power supply and the final amplifier. The exciter is assembled in a 12  $\times$  7  $\times$  4-inch ICA "Flexi-mount" box.

In the exciter unit, the VFO occupies the front end, with the tuning capacitor  $C_{1A}$  enclosed in an aluminum box on top, and the inductor  $L_1$  mounted underneath on a small stand-off insulator fastened against the front wall. In the rear/top view, the crystal and crystal-oscillator tube are to the right of the tuning-capacitor box, and the VFO tube is to the left, followed by the string of multiplier tubes. The 10-meter stage is at the rear of the chassis.

Underneath, the four remaining units of the tuning gang,  $C_{1B}$ - $C_{1C}$ , are lined up at the center of the chassis. They are driven by a brass gear

Bottom view showing components underneath the three chassis. In the exciter chassis at the center, the low-frequency circuits are toward the panel and the 10-meter circuit is at the rear of the chassis. Coils and trimmer capacitors are in groups around the associated bandswitch wafer.

Looking down into the final-amplifier box. The amplifier tubes are submounted. Also shown is the 6L6 clamper tube.

attached to the tail shaft of the VFO tuning capacitor,  $C_{1A}$  above, and another gear on the shaft of the first multiplier tuning capacitor,  $C_{1B}$ , below. The gears engage through a slot cut in the chassis. (I may say that this arrangement is not as satisfactory as it might be and if I were going to do the job again, I would mount the entire gang on top of the chassis, cover it with a long narrow box of aluminum, and feed the stator leads through holes to the switch sections below.)

The bandswitch, with the wafers spaced approximately according to the tube spacing, is mounted between a partition that shields the VFO from the rest of the exciter, and the rear wall of the box. The last wafer,  $S_{2E}$ , is mounted on the outside of the box. The partition shielding the VFO also serves as a mounting for the crystal-VFO switch,  $S_1$ , and the excitation control,  $R_1$ .

In the bottom view, the inductors for the multiplier stages and the padder capacitors,  $C_6$ ,  $C_8$ ,  $C_{10}$  and  $C_{12}$ , are to the right of the band-switch. The tube sockets and the grid trimmer capacitors,  $C_7$ ,  $C_9$ , and  $C_{11}$ , are to the left. The VFO trimmer,  $C_2$ , is to the right, close to the front wall of the chassis. (Its control shaft is behind the crystal-oscillator tube in the rear view.)

A 1-inch extension of aluminum is attached to the rear of the exciter box to make its over-all length 13 inches to match the adjacent chassis. The r.f. filter components and the 6AQ5 screen

resistors (as well as the last section of the band-switch,  $S_{2E}$ ), are placed inside the enclosure, and the compartment is fitted with a cover plate of aluminum. A terminal strip is set in the upper edge.

### Capacitor Gang

In building this unit, I made use of components on hand whenever possible. The condenser gang,  $C_1$ , is made up of individual capacitors connected together with shaft couplers. Care must be used in selecting capacitors that will fit into the length of the "Flexi-mount" box. One inch must be allowed for the hub of the National ACN dial, leaving only 11 inches for the tuning gang. A suitable gang can be made up of Bud "Tiny-Mite" dual capacitors. A dual 25- $\mu\text{f}$ . unit (LC-1661) with its sections connected in parallel will serve for  $C_{1A}$ . A dual 50- $\mu\text{f}$ . unit (LC-1662) can be used for  $C_{1B}$  and  $C_{1C}$ . Five plates (3 rotor and 2 stator) should be removed from the  $C_{1C}$  section. Another dual 50- $\mu\text{f}$ . unit can be used for  $C_{1D}$  and  $C_{1E}$ , removing plates, as above, for  $C_{1D}$ .

### Amplifier

The amplifier is enclosed in a homemade aluminum box fastened to the top of the 5  $\times$  13  $\times$  3-inch chassis. The box is 4½ inches high (limited by the height of the 8¾-inch panel), the same width as the chassis, and long enough to include the 807s and the multi-band tank-circuit components, yet leave sufficient room for the 6L6 clamper tube in front and a terminal strip at the rear. The sides and top are perforated to provide ventilation. The tuning capacitor  $C_{14}$  and the output inductors  $L_{10}$ ,  $L_{11}$  and  $L_{12}$ , are placed centrally in the box, and as far toward the front as possible. The capacitor is mounted directly on the front wall of the box, and rests against the chassis. In an effort to reduce the length of the path between the rotor of the capacitor and the 807 cathodes, short leads from each end of the rotor were brought through holes and fastened to the under side of the chassis. To allow room for the 300-ma. meter, which has a 2½-inch-diameter flange, the dial

#### Inductor Dimensions

- $L_1$  — 30 turns No. 30, close-wound.<sup>1</sup>
- $L_2$  — 35 turns No. 26, close-wound.<sup>2</sup>
- $L_3$  — 18 turns No. 26, ⅝ inch long.<sup>2</sup>
- $L_4$  — 8 turns No. 26, ½ inch long.<sup>2</sup>
- $L_5$  — 5 turns No. 26, ½ inch long.<sup>2</sup>
- $L_6$  — 3 turns No. 26, ¼ inch long.<sup>2</sup>
- $L_7, L_8$  — 1  $\mu\text{h}$ . (National R-33). See text.
- $L_9$  — 5 turns No. 14, ¼-inch diam., ⅝ inch long.
- $L_{10}$  — 12 turns No. 16, 2-inch diam., 1¼ inches long (B & W 3907 strip inductor).
- $L_{11}$  — 6 turns No. 14, 1¼-inch diam., ¾ inch long (see text).
- $L_{12}$  — 8 turns No. 16, 2-inch diam., ¾ inch long (B & W 3908 strip inductor).

<sup>1</sup> Wound on Millen or National 1-inch diam. phenolic form.

<sup>2</sup> Wound on National XR-50 iron-slug form, ⅝-inch diameter.

Fig. 2 — Circuit of the low-voltage power supply.

T<sub>1</sub> — UTC R-109.

T<sub>2</sub> — UTC FT-8.

must be set so low on an 8 $\frac{3}{4}$ -inch panel that it is necessary to use a flexible shaft between the dial and the tuning-capacitor shaft. With a 10 $\frac{3}{4}$ -inch panel this would not be a problem, of course.

Holes to clear the bases of the 807s are cut in the top of the chassis, and the sockets are sub-mounted, on a U-shaped strip of aluminum, to a depth that brings the caps of the 807s clear of the top cover of the box. Here again, a 10 $\frac{3}{4}$ -inch panel might provide greater freedom in the method of mounting. Millen shield cans are used with the tubes.

### Inductors

The inductors were originally all made from B & W 3907 strip inductor stock as shown in the top view, simply opening up the winding where necessary to provide the proper terminals. However, the high-frequency section, L<sub>11</sub>, ran warm enough to soften the plastic supporting strips. This difficulty was solved later by making L<sub>11</sub> a separate section, wound on a ceramic form. Similar forms may be hard to come by, but it should not be too difficult to make a self-supporting coil of the same inductance, since the dimensions are small. The output coupling inductor, L<sub>12</sub>, should be placed between L<sub>10</sub> and L<sub>11</sub>.

The output-link switch, S<sub>3</sub>, and the link tuning capacitor, C<sub>17</sub>, are mounted under the chassis, as shown in the bottom-view photograph.

Shielded phonograph jacks are mounted near the rear ends of the exciter and amplifier chassis

and are connected with a short length of RG-59/U coax fitted with phonograph plugs.

### Power Supply

The low-voltage power supply is built on the second 5 × 13 × 3-inch chassis. The circuit is shown in Fig. 2. The arrangement of components is not critical so long as they are accommodated in the available space. This section includes the 10-ma. meter and its switch, indicator lights for filament and plate voltage, and a pair of toggle switches to control these supplies. The high-voltage supply is conventional, using choke input and a transformer rated at 600 or 750 v. d.c., 200 to 300 ma.

### Adjustment

After checking the crystal oscillator to make sure that it is functioning properly, the VFO should be checked and its tuning range adjusted to cover the desired range of frequencies. Setting C<sub>1</sub> to minimum capacitance, C<sub>2</sub> should be adjusted until the oscillator is heard at 4000 kc., or a few kc. higher. Then, with the bandswitch in the 80-meter position, and the milliammeter reading grid current to the 807s, C<sub>6</sub> should be set at midscale (C<sub>1</sub> still at minimum capacitance) and the slug in L<sub>2</sub> adjusted for maximum 807 grid current. Then C<sub>1</sub> should be adjusted until the oscillator signal is heard at 3200 kc., and C<sub>6</sub> readjusted for maximum grid current. If this last adjustment requires an increase in the capacitance of C<sub>6</sub>, the tuning range of the 80-

### Ripple on the S.S.B. 'Scope Pattern

IT is well known that a perfect single-tone single-sideband signal consists of but a single radio frequency. When such a signal is displayed on the face of a 'scope being swept horizontally at an audio-frequency rate, the pattern is a horizontal band having perfectly smooth and straight upper and lower edges. It is identical with the pattern of any unmodulated carrier.

If the suppression of the other sideband or the carrier is not complete, the edges of the pattern show a ripple. Assuming that the carrier is completely suppressed, the relationship between the desired and undesired side frequencies can be represented by the phasor<sup>1</sup> diagram shown in Fig. 1. *AB* represents the amplitude

Fig. 1 — The mechanism by which the undesired side frequency makes a "ripple" on the desired side frequency of an s.s.b. signal. Other possible spurious components are neglected in this drawing, but can be included if their relative amplitudes, phases, and frequency separation from the desired side frequency are known.

of the desired side frequency and *BC* the amplitude of the undesired side frequency. The latter rotates with respect to *AB*, with *C* describing the dashed circle. The rate of rotation is equal to twice the audio modulation frequency since the two frequencies are separated in the spectrum by that number of cycles. At some instant during each such period of rotation point *C* will reach *X* and the total instantaneous amplitude will be the distance *AX*. A half-period later *C* will coincide with *Y* and the total instantaneous amplitude will be *AY*. As displayed on the face of the 'scope, this time variation is transformed into a ripple along the horizontal edges of the pattern, the maximum vertical excursions lying between *AY* and *AX*.

Since the relative amplitudes of the desired and undesired are *AB* and *BC*, respectively, the ratio of desired to undesired is *AB/BC*. This amplitude ratio is also equal to twice the length *AB* divided by the distance *XY*. In terms of the

'scope pattern, this means that the average height of the pattern divided by the vertical distance between a peak and valley of the ripple gives the ratio by which the undesired side frequency is suppressed.

Fig. 2 shows these quantities as they appear on the tube face, together with typical patterns for various ratios of spurious suppression. The latter are drawn as closely to scale as possible, and therefore can serve as a guide to estimating spurious suppression without actual measurement and calculation.

In examining such a pattern, it is necessary that the horizontal sweep in the 'scope be synchronized at some submultiple of the modulation frequency in order to get a stationary picture. Without such synchronization the ripple becomes merely a blur. Since the edge of the blur is a straight line, the unwary operator can lead himself to believe he has a "perfect" s.s.b. transmitter when in actuality it may be pretty poor.

It is also necessary, although it should not be, to emphasize that the audio gain must be kept below the point where any stage in the transmitter tends to saturate. Saturation of an amplifier gives a beautiful pattern, but unfortunately, the actual output contains all sorts of spurious that the 'scope can't show.

#### Total Spurious

The actual situation in a practical transmitter is not quite so simple as it has been outlined above. The assumption that the transmitter output consists only of the desired side frequency and its undesired "image" can seldom be justified in practice. There are always other components present in the transmitted signal even when the audio input is ostensibly a single tone. These are (1) the residual carrier, if it is not balanced out to considerably better than 40 db. below the desired side frequency; (2) components resulting from harmonic distortion either in the audio input signal or added to the signal in the speech amplifier and modulator; (3) intermodulation components generated in r.f. stages.

These components have a definite frequency spacing in the spectrum, always appearing at some multiple of the audio modulation frequency on one side or the other — or on both sides — of the carrier frequency. The amplitudes of the last two, at least, can easily exceed the amplitude of the undesired side frequency in a well-designed single-sideband transmitter. What the 'scope shows, consequently, is the composite of all the spurious components present.

As a result, the actual shape of the ripple

<sup>1</sup> The term "phasor" is not used in an attempt to confuse the reader, but to conform with a recommendation of I.R.E. "Phasor" is preferred to "vector" because while the vector representation is convenient for showing relative phase and amplitude of a.c. currents and/or voltages, these quantities are not actually vectors — that is, there is no spatial direction associated with them.

$$\frac{\text{DESIRED}}{\text{SPURIOUS}} = 20 \text{ LOG } \frac{X+Y}{2(X-Y)} \text{ DB}$$

FOR 40 DB	$\frac{X+Y}{2(X-Y)} = 100$
35 DB	$= 56$
30 DB	$= 32$
25 DB	$= 18$
20 DB	$= 10$

Fig. 2 — Examples of 'scope patterns for various desired/undesired ratios, and the method of calculating suppression of composite spurious from measurement of the 'scope pattern.

along the edge of the pattern is seldom as conventionally sinusoidal as the ripple in the drawings of Fig. 2. The ripple peaks are a measure of the total effect in about the same way that the corresponding peak-to-peak variations are a measure of the total effect of an ordinary a.m. signal displayed on a 'scope. That is, when the a.m. signal is tuned in in the normal way, with the beat oscillator off, using a receiving bandwidth large enough to accept the entire transmitted spectrum, the audio output is the total effect of the variations seen in the 'scope pattern. If the s.s.b. signal is tuned in similarly (using the desired side frequency as the carrier) the audio output from the signal is the total effect of the ripple.

No one component of the several always present in an actual signal can be separated readily from the others in the 'scope pattern. To do this requires a "spectrum analyzer" such as a receiver having sufficient selectivity for the purpose. Also, the peak-to-peak ripple as shown by the 'scope is usually less than the arithmetic sum of the individual components that make up the composite signal because of the non-uniform phase relationship between components. However, it is not likely that any *single* component would have an amplitude greater than that of the composite ripple. Hence the latter would appear to offer a reasonable basis for rating the desired/spurious ratio of the transmitter. As compared with other methods of rating that might be chosen, it has the advantage of being readily measured with the conventional 'scope set-up.

A desired/spurious ratio not exceeding 30 db. at any audio frequency within the nominal

a.f. band of the transmitter can be achieved if the transmitter is adjusted and operated with reasonable intelligence. On a pattern having an average height of 2 inches (typical of a 5-inch 'scope) the peak-to-peak ripple height is  $\frac{1}{6}$  inch for a 30-db. ratio.

—G.G.

## Silent Keys

IT is with deep regret that we record the passing of these amateurs:

- W1AII, Richard E. Osgood, Windsor, Vt.
- W1QIT, Paul P. Simeone, Andover, Mass.
- W2GAU, Frederick H. Atkinson, New York, N. Y.
- W2OCI, Roy O. Woods, Brooklyn, N. Y.

## The T-90 Transmitter

**A**LTHOUGH the T-90 transmitter can be used in mobile, portable or fixed locations, it is apparent that mobile considerations were paramount when it was designed. The packaging and shape are such that it should fit easily under any dashboard, and the scheduled companion

The T-90 covers 80 through 10 meters with VFO or crystal control, 'phone or c.w. Here it is out of its case — the audio section is in the foreground and the 6146 output stage is at the upper left, behind the shield. The switch mounted above the chassis (upper center) selects the fixed capacitors in the output of the pi-tank circuit. The antenna relay can be seen right next to it.

receiver in the same sized package further confirms the viewpoint. However, it isn't fair to label this a "mobile" transmitter and give the impression that home-station operation has thus in some way been compromised, because the T-90 is a full station within its tube capabilities. A built-in antenna relay and the aforementioned packaging simply means that you don't have to add extra gadgets when you put this home station in your car.

The transmitter falls just under the 100-watt class, since the rated d.c. input to the output-stage 6146 is 90 watts on c.w. and 75 watts on 'phone. A glance at the block diagram in Fig. 1 will show a lot more than a mess of words, and you can see that the tube line-up is similar to other transmitters in this class. A 6AQ5 clamp tube is included to protect the 6146 by holding the screen voltage down when there is no excitation, and 6AQ5s are used in the two fixed-tuned amplifier/multiplier stages as well. The oscillator job (VFO or crystal) is delegated to a 6CL6, and its voltages are regulated by the 0B2 to minimize frequency changes with changes in line voltage. The r.f. section can be keyed in either the oscillator and first amplifier/multiplier stage cathodes or in the cathode of the first amplifier/multiplier alone, depending upon your preference and the setting of a function switch on the panel that also cuts in the modulator for 'phone work.

The audio portion starts with a 6AU6 speech amplifier, with a chassis-mounted switch that permits either carbon or high-impedance crystal or dynamic microphone to be used. This is followed by a 6AQ5 driver and a pair of 6AV5 modulators. A negative feed-back loop around

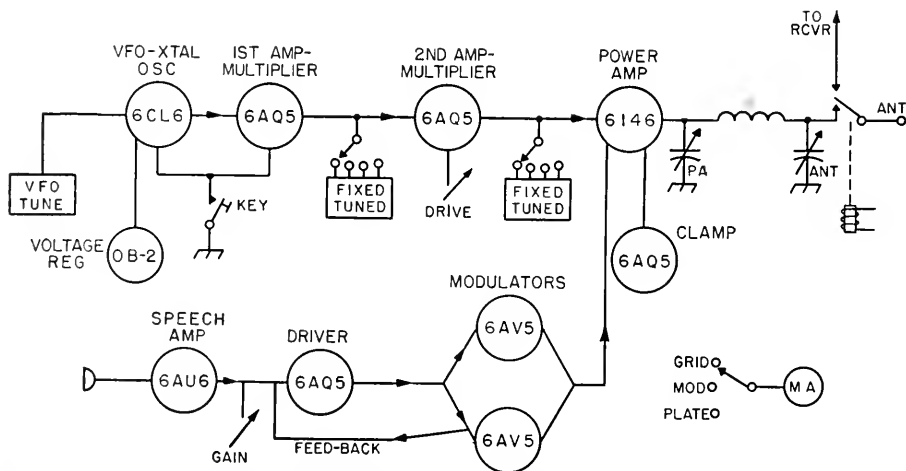

Fig. 1 — Block diagram of the T-90 transmitter. The antenna relay has another circuit (not shown) that turns on the transmitter. The relay is actuated by a panel switch or a push-to-talk switch on the microphone.

the driver stage is included, and it may account for the good quality we observed when the unit was checked on 'phone.

The front panel of this compact ( $12\frac{3}{8}$  wide by  $10\frac{1}{2}$  deep by  $6\frac{3}{4}$  inches high) unit has a couple of departures from usual practice. The first that hits your eye is the apparent lack of a VFO tuning knob! You stop worrying about this when you discover that the VFO tuning and the bandswitch are concentric controls (à la TV), a dodge that makes for an uncrowded panel. The audio gain control, instead of a large knob matching the others in size, is a small knurled shaft that can hardly be seen. And why not? — the audio volume control on a transmitter doesn't get the steady handling that a receiver volume control does. The rest of the controls are what you would expect on a transmitter of this type: a meter switch for the r.f. grid and plate current and the modulator cathode current, a TUNE-CW-HET-PHONE switch (TUNE reduces power to the output stage and disables the modulator, and HET turns on the VFO for frequency spotting or amplifier-only keying), a DRIVE switch for varying excitation

This close-up view of the 6146 output stage shows the plate tuning capacitor and the three sections of the output inductor.

Fig. 2 — Simplified oscillator circuit of the T-90. When using VFO, the crystal socket requires a shorting plug. When crystal control is used, the VFO tuned circuit can be used to "pull" the crystal frequency slightly and thus "zero in" on a net frequency.

by changing the screen voltage to the driver stage, and PLATE and ANT tuning.

The ANT tuning control is more than meets the eye. Since a pi-network output circuit is used, there is the normal need for a wide variation in output capacitance. In the T-90, the control turns the rotor of a 150-μf. variable capacitor. On the far end of the rotor shaft there is a pin that engages a spoke on a switch shaft

An additional shield cover has been removed to show the VFO compartment (lower center). The hub and spokes at the center left drive the output-capacitor switch shown in another photograph. The spokes are driven by an arm on the shaft of the output tuning capacitor at the lower left.

once every revolution. Thus each time the capacitor shaft makes a full revolution, more or less fixed capacitance is also thrown into the circuit via the switch. This tricky little device can be seen in one of the photographs.

When crystal-controlled operation is desired, the crystals can be changed from the front panel by removing the crystal access door on the panel and plugging in the desired crystal. When VFO operation is used, a shorting plug is required in the crystal socket. The oscillator circuit is shown in Fig. 2 — it is a little unusual in that the VFO tuned circuit is used to "rubber" the crystal and permit its frequency to be pulled slightly.

Two power supplies are available for use with the T-90. The APS-90 is for use in fixed-station operation and works from the 115-volt 60-cycle line, and the VPS-90 vibrator supply is designed to furnish the necessary power from either a 6.3- or 12.6-volt d.c. source.

The T-90 is a product of Harvey-Wells Electronics, Inc.

— B. G.

# Happenings of the Month

## ELECTION NOTICE

**To All Full Members of the American Radio Relay League Residing in the Atlantic, Canadian, Dakota, Delta, Great Lakes, Midwest, Pacific and Southeastern Divisions.**

An election is about to be held in each of the above-mentioned divisions to choose both a director and a vice-director for the 1956-1957 term. These elections constitute an important part of the machinery of self-government of ARRL. They provide the constitutional opportunity for members to put the direction of their association in the hands of representatives of their own choosing. The election procedures are specified in the By-Laws. A copy of the Articles of Association and By-Laws will be mailed to any member upon request.

Nomination is by petition, which must reach the Headquarters by noon of September 20th. Nominating petitions are hereby solicited. Ten or more Full Members of the League residing in any one of the above-named divisions may join in nominating any eligible Full Member residing in that division as a candidate for director therefrom, or as a candidate for vice-director therefrom. No person may simultaneously be a candidate for both offices; if petitions are received naming the same candidate for both offices, his nomination will be deemed for director only and his nomination for vice-director will be void. Inasmuch as all the powers of the director are transferred to the vice-director in the event of the director's resignation or death or inability to perform his duties, it is of as great importance to name a candidate for vice-director as it is for director. The following form for nomination is suggested:

### Executive Committee

*The American Radio Relay League  
West Hartford 7, Conn.*

*We, the undersigned Full Members of the ARRL residing in the ..... Division, hereby nominate ..... of ..... as a candidate for director; and we also nominate ..... of ..... as a candidate for vice-director; from this division for the 1956-1957 term.*

*(Signatures and addresses)*

The signers must be Full Members in good standing. The nominee must be a Full Member and the holder of an amateur license, and must have been a member of the League for a continuous term of at least four years at the time of his election. No person is eligible who is commercially engaged in the manufacture, sale or rental of radio apparatus capable of being used in radio communications, or is commercially engaged in the publication of radio literature intended in whole or in part for consumption by radio amateurs.

All such petitions must be filed at the headquarters office of the League in West Hartford, Conn., by noon EDST of the 20th day of September, 1955. There is no limit to the

number of petitions that may be filed on behalf of a given candidate but no member shall append his signature to more than one petition for the office of director and one petition for the office of vice-director. To be valid, a petition must have the signature of at least ten Full Members in good standing; that is to say, ten or more Full Members must join in executing a single document; a candidate is not nominated by one petition bearing six valid signatures and another bearing four. Petitioners are urged to have an ample number of signatures, since nominators are occasionally found not to be Full Members in good standing. It is not necessary that a petition name candidates both for director and for vice-director but members are urged to interest themselves equally in the two offices.

League members are classified as Full Members and Associate Members. Only those possessing Full Membership may nominate candidates or stand as candidates; members holding Associate Membership are not eligible to either function.

Voting by ballots mailed to each Full Member will take place between October 1st and November 20th, except that if on September 20th only one eligible candidate has been nominated, he will be declared elected.

Present directors and vice-directors for these divisions are as follows: *Atlantic:* Gilbert L. Crossley, W3YA, and Charles O. Badgett, W3LVF. *Canadian:* Alex Reid, VE2BE, and Reginald K. Town, VE7AC. *Dakota:* Alfred M. Gowan, W0PHR, and Forrest Bryant, W0FDS. *Delta:* George H. Steed, W5BUX, and George S. Acton, W5BMM. *Great Lakes:* John H. Brabb, W8SPF, and Robert L. Davis, W8EYE. *Midwest:* William J. Schmidt, W0OZN, and James E. McKim, W0MVG. *Pacific:* Harry M. Engwicht, W6HC, and (no vice-director). *Southeastern:* James P. Born, jr., W4ZD, and Randall E. Smith, W4DQA.

Full Members are urged to take the initiative and to file nomination petitions immediately.

For the Board of Directors:

A. L. BUDLONG  
Secretary

July 1, 1955

## F.C.C. NOTES

Richard A. Mack, for some years a member of the Florida Railroad & Public Utilities Commission, has been appointed to the Federal Communications Commission. He replaces Miss Frieda Henneck, whose term expired June 30th; she is returning to law practice.

Edwin L. White, W4AS, since its establishment in 1950 the Chief of FCC's Safety & Special Radio Services Bureau (parent bureau for the amateur service) retired July 31st from many years of government service. His successor is Curtis B. Plummer (ex-W3KRK), former head of the Broadcast Bureau.

## "WT" PREFIX DENIED

A Texas amateur recently petitioned the Commission to include the letter "T" in the prefix of call signs issued to Technician Class amateurs "for the purpose of distinguishing this class of amateur radio station from other classes of amateur radio stations and discouraging unauthorized operation by Technician Class stations in frequency bands allocated for the exclusive use of higher class amateur radio stations."

FCC has denied it, saying that adoption "would require the modification of approximately 12,207 Technician Class Amateur Radio Stations, and with the ever increasing work load in the Commission and with the limited personnel available, the administrative difficulties created by the adoption thereof would not be justified by the benefits, if any, derived therefrom."

### F.C.C. APPLICATIONS

Amateur applicants commonly suffer nervousness in taking the code test; they apparently are similarly afflicted when filling out application forms. FCC's licensing branch has recently had more trouble than usual with errors in application blanks, including renewals. Many applicants, undoubtedly through oversight or carelessness, fail to answer the question, "Are you a representative of an alien or of a foreign government?" Many fail to notarize. Many, in the case of renewals, omit necessary data such as place and date of birth, apparently figuring FCC already has this information (it does, but the info is usually required for positive identification of the application). And you'd be surprised how many fellows fill out "date of birth" with the proper month and date — but with the year 1955!

We can all help ourselves by helping FCC — be careful that *your* application is completely and accurately filled out so that processing will not be delayed.

### LAOS OFF BANNED LIST

In mid-July FCC announced that the government of Laos has withdrawn its objection, earlier filed with the International Telecommunications Union, to communication between its amateurs and the rest of the world. The prefix is XWS, and work with these stations is now permissible.

### THIRD-PARTY TRAFFIC

In the handling of third-party traffic internationally, aside from countries where special agreements exist (Canada, Chile, Cuba, Ecuador, Liberia, Peru) we have had a convenient rule-of-thumb that traffic is permissible with any amateur station possessing a one- or two-letter W or K prefix. There is now an exception: KA. The Japanese government has indicated that it wishes privileges available to all amateur stations in its country to be uniform; inasmuch as JAs of course have no third-party privileges, the KAs in Japan are now also restricted from such activity. Other prefixes, even in the same area, are not affected; e.g., Okinawa, with the prefix KR6, is still okay for traffic.

### RTTY SHIFT

The ARRL Board of Directors at its May meeting instructed the General Manager to file, subject to an investigation as to its feasibility, a request with the Federal Communications Commission to amend the amateur rules so as to permit frequency shifts of less than the present

(Continued on page 128)

### WHAT BANDS AVAILABLE?

Below is a summary of the U. S. amateur bands on which operation is permitted as of August 1st. Changes will, as usual, be announced by W1AW bulletins. Figures are megacycles. A0 means an unmodulated carrier; A1 means c.w. telegraphy; A2 is m.c.w.; A3 is a.m. 'phone; A4 is facsimile; A5 is television; F1 is frequency-shift keying; n.f.m. designates narrow-band frequency- or phase-modulated radiotelephony; and f.m. means frequency modulation, 'phone (including n.f.m.) or telegraphy.

3.500-4.000	— A1
3.500-3.800	— F1
3.800-4.000	— A3 and n.f.m.
7.000-7.300	— A1
7.000-7.200	— F1
7.200-7.300	— A3 and n.f.m.
14.000-14.350	— A1
14.000-14.200	— F1
14.200-14.300	— A3 and n.f.m.
14.300-14.350	— F1
21.000-21.450	— A1

Texas, Okla., Kansas	1800-1825	200	75
	1875-1900		

\* Except in State of Washington where daytime power limited to 200 watts and nighttime power to 50 watts.

**Novice** licensees may use the following frequencies, transmitters to be crystal-controlled with a maximum power input of 75 watts.

3.700-3.750	A1	21.100-21.250	A1
7.150-7.200	A1	145-147	A1, A3

**Technician** licensees are permitted all amateur privileges in 50-54 Mc. and in the bands 220 Mc. and above.

# Hints and Kinks

## For the Experimenter

### DEBURRING TOOLS

**J**AGGED BURRS around screw, ventilation, bezel and socket holes are not only unsightly indicators of poor workmanship but also constitute a considerable hazard, as the burrs have and retain razor-sharp edges.

Deburring is an irritating and time-consuming job under most conditions because of lack of suitable tools. With soft metals, a knife blade is partially satisfactory, but may slip out of the hole being deburred, cutting a deep gouge in the panel, or a gash in the hand. Small hand grinders are somewhat more satisfactory, at a cost of about \$25.00 each, plus about one cent per hole for wheel replacement. Metal countersinks have been used, but these, having a 55- or 60-degree included angle, ream the hole almost as fast as they remove the burr.

Quite satisfactory deburring can be done with a carpenter's wood countersink having an included angle of approximately 90 degrees. These, which come in all sizes up to about  $\frac{3}{4}$  inch in diameter, are supplied with a square shank. To convert a carpenter's wood countersink into a deburring tool, grind off the corners of the shank and drive the shank into a plastic screwdriver handle from which the blade has been pulled.

Performance will be most satisfactory if the axes of the handle and of the countersink coincide. Length of the finished tool should be approximately six inches, with a tolerance of about plus or minus one inch to suit the materials available and the user's personal taste.

Larger holes are easily deburred by use of an automotive valve-seat reamer. These come with four, five, and six blades and cost from \$2.00 up. No changes are needed in this tool, and those with a large number of blades, such as six, are preferable to the four-bladed type. When only steel is to be used, an abrasive valve seater, which is merely a conical grindstone with a large included angle, such as 105 degrees, is very effective. This cannot be used with soft metals, such as aluminum, as the abrasive will plug up after deburring only a few holes.

— Ronald L. Ives

### STAND-BY SWITCH FOR THE HQ-129X

**D**URING week ends it was desired to leave my recently acquired HQ-129X on stand-by for long periods and this made desirable the removal of B+ from all tubes of the receiver. This meant the addition of a switch in the ground side of the plate-supply circuit, but the thought of any panel drilling that might adversely affect the resale

value of the receiver was deemed objectionable.

The solution arrived at was to remove the existing 5000-ohm sensitivity potentiometer and replace it with a type having an on-off switch mounted on the rear cover. The switch is, of course, used to break the negative plate-supply lead. With the revision, the receiver is turned on or off with the sensitivity control, the front panel remains intact, and the "relay control" function of the original stand-by switch ( $S_6$  of the circuit for the HQ-129X) is not impaired.

— Edwin A. Gilcher, W8NFW

### MORE ABOUT THE NOVEL VENTILATING SYSTEM FOR MOBILE UNITS

**W**HEN using the ventilating suggested by W9JX in *QST* for June, 1955, it is advisable to avoid connection to the vacuum line from the intake system. Otherwise, you may run into valve trouble caused by an improper air-gas mixture from the carburetor.

— Bill Norman, W5TXM

### PERIODIC INSPECTION FOR COPPERCLAD WIRE ANTENNAS

**H**ERE is a tip, learned from bitter experience, that should benefit any of the gang who use surplus copperclad wire for their sky hooks. Antennas made from this material require inspection once a year or so if deterioration in advance of actual breakdown is to be detected. In my own case, I had a nifty 340-footer about 50 feet high that was made with surplus aircraft-trail wire obtained from a bargain 3000-foot reel. After about four years of service — without inspection — trouble started. Wherever the wire came in contact with stand-offs, strain insulators or other supports, and at points where bends were necessary, the copper coating had worn through and rust had eaten into the core, thus creating about half a dozen high-resistance joints that finally broke down.

— Wm. Plimpton, W2IXH

### SCORING ALUMINUM WITH A GLASS CUTTER

**A**N ordinary dime-store glass cutter (disk roller type) makes an excellent tool for cutting aluminum sheet. Just score each side of the sheet and then flex the aluminum until it parts at the score. If the sheet being worked with is fairly large, it pays to clamp the metal along the score lines by one means or another.

— Kenneth Cary, K2CAK

## YOU'RE COVERED

705 Ninth Avenue  
Brookings, So. Dak.

Editor, *QST*:

I have read with interest your article "Lightning Protection for the Transmitting Antenna (July *QST*). Inasmuch as I am in accord with the article and endorse all the ideas involved there is one thing that should be straightened out. There is no condition in any of the fire forms used for insurance purposes on a private dwelling that would invalidate an insurance policy insuring such private dwelling whether that antenna is a TV antenna or a 5-element beam for 10 meters.

There are too many people now who believe that insurance is a necessary evil and one of those articles that have to be paid for because of a loan on their dwelling. If you can find any of the so-called fine print excluding coverage in a private dwelling fire form because of an improperly-installed antenna, please send it out to this ham. It would be very interesting, I can assure you.

For further information I would suggest that you contact two of the best insurance companies in the world for further information, The Hartford Fire and The Travelers, both of whom we represent.

— Robert T. Bates, WØUDI

[Error's Note: Hartford Fire confirms nothing in the fine print invalidates a policy specifically because of an antenna installation.]

## ET REPLY

P. O. Box 1636  
Addis Ababa, Ethiopia

Editor, *QST*:

Many thanks to WØPDN for his understanding letter in the May issue. He is correct in his assumption that air mail stamps for every QSO is completely out for most Ethiopians. Especially those in the Armed Forces have an allowance not at all comparable with that of the U. S. Forces, and the civilian standard could be regarded much in the same way.

One of the most active ham stations is that of the Imperial Ethiopian Air Force, ET3Q and ET3R, which is worked entirely by A. F. personnel. I will admit that the promised QSLs from here, in many cases, have not been sent in the past. I enclose a QSL card from ET3Q which has been released for use only some weeks ago by His Imperial Majesty. I now hope the QSL cards from here will drop in more regularly at the stations of U. S. hams. Please, don't ask for air mail.

— Gunnar Ensjo, SM5AES/ET3Q  
Imperial Ethiopian Air Force

## SEVENTY-FIVE

P. O. Box 3093  
Rochester 14, N. Y.

Editor, *QST*:

... Recently I came back to 75 because a fellow ham friend of mine vacationing in Canada asked me to keep morning skeds with him. ...

I listened around and I found new voices and recognized some old ones. But what surprised me very much was a new mode of calling which must be peculiar to 75 because I have not heard that stuff on other bands. For example: "Calling CQ class A," and "Calling CQ no lids." Then I heard guys talking about guys and mentioning names and call letters openly. Intentional QRM galore. Traffic nets in bunches, where real traffic just is not it. I asked one old timer "How?" and he said "Oh, that's been going on for

years, where've ya been?" In that period of time I was absent from 75 I think I've come back a couple of times before, but did not stay as long as this time. I listened some more and I got disgusted with it.

My opinion of that particular brand of ham radio is that it is not genuine ham radio at all; one of the guys I heard is suffering from such an inferiority complex that he is making his friends and others who bother with it, act like foolish kids. As soon as my friend returns from his vacation, I'll go back to DX-c.w. for that band, 75, is for the birds as far as I'm concerned.

— Charles I. Otero, W2UPH

503 Sunset Road  
W. Reading, Penna.

Editor, *QST*:

I am secretary of the Reading Radio Club, members of which have participated in many of the activities mentioned in your July editorial, "Public Relations." ... Our latest effort was the Powder Puff Derby; we were asked to relay between the Reading Airport and the terminus of the Derby, Springfield, Mass. ... Most of the boys on 75 are swell fellows; many of them cooperated with us 100%; however, two or three gave us a rough time. ...

We fully realize that all amateur frequencies are open to everyone, and we also realize that the public in general resents being pushed around. ... But when we politely requested W3 — to keep this particular channel clear he resented the request, called us Space Cadets, and flatly refused to stay off the frequency. ... Several other stations also resented our request. For instance, W2 —; every time we would sign he'd come on the frequency calling another station. We doubt that he actually was in contact with anyone because of the fact that whoever he might have been talking to surely could not have stopped transmitting at the exact time we did, so many times in succession. This same W2 — would hook up with a powerful station elsewhere in the band, tell him he had QRM and that he should change frequency and move down on the frequency we were using. Then both would carry on a QSO.

What would the Old Man think about such tactics? What would happen in an emergency? Why can't we look at it in this way and realize that here are a bunch of hams doing something to publicize ham radio, giving of their time, gratis, trying to live up to the concept of your editorial, and give us a hand instead of a fist.

Before I close, we of the Reading Radio Club wish to thank again the fellows who cooperated with us in this venture.

— Stanton L. Bast, W3CCH

## EXTRA CLASS PRIVILEGES

446 N. W. 8th St.  
Homestead, Fla.

Editor, *QST*:

I've been thinking over the situation of the Amateur Extra Class license and have come up with an idea which might provide a little incentive for getting a ticket.

Some of the little used portions of the ham bands could be set aside exclusively for Amateur Extra ops. For example, 14,300-14,350 kc. could be used.

Another thing, which would probably bring a lot of argument, would be to allow only Amateur Extra operators to employ such advanced techniques as RTTY and s.s.b.

Let's hear from the fellows on this subject.

(Incidentally, I'm not Amateur Extra, but General Class, although I do intend to get it just as soon as I have had my ticket long enough.)

— Bob Payne, W4CWZ

# Amateurs in Operation Alert, 1955

## *A Summary of Reports of Amateur/RACES Participation in FCDA's Nation-wide Civil Defense Test*

BY GEORGE HART, WINJM

ON June 15th, at 1600 GMT, Civil Defense organizations throughout the country swung into action to put to the test our nation-wide c.d. establishment. The entire nation was subjected to a thorough simulated plastering by nuclear weapons, from twenty kiloton (1x) to five megaton (250x) in size. As far as nuclear attack is concerned, FCDA was assuming the worst, except that all concerned were notified in advance.

Under date of June 1st, ARRL notified its entire contingent of Emergency Coordinators (some 1700 of them) of the coming exercise, urging them to activate their RACES or pending RACES plans in this exercise. Instead of requesting them to fill out another questionnaire form, we this time asked for a simple narrative of activities in their area. This report is a summary of such narratives, condensed or reduced as necessary to fit into available *QST* space. If the report of activities in your area is not, perchance, included, it is because up to copy time nothing was received indicating that you were active.

### **Arizona**

In Tucson, the civil defense council dispersed to a fringe area (Marana Air Base) and depended on Al Steinbrecher, W7LVR (SCM), to maintain

contact with elements not present at this control center. Al did a good job and was relied on heavily.

### **California**

The Lennox District of the Los Angeles County Disaster-Civil Defense Authority (RACES) operated as the Lennox Disaster-Civil Defense Net (AREC) extensively. Prepared messages were distributed by the ten-meter mobile stations, who reported the locations of messages left and the party to see the NCS. This was posted on a map. Then 2-meter stations were dispatched to pick up the messages and transmit them to the 2-meter NCS, where they were answered and relayed back to the originating station. RACES tactical calls were used by all authorized stations. RO and EC W6NHP states that there are now 52 members of the Lennox C.D. Net with RACES certifications. Forty-eight amateurs participated.

### **British Columbia**

SEC VE7DH summarizes the operation in British Columbia. Nineteen stations participated, with sixteen monitoring and ready to help. A total of 322 messages were handled, including 87 by VE7QC, 118 by VE7KL (NCS) and 47 by VE7NO. VE7ASR acted as mobile net control. VE7AHJ monitored Alaska alert KL7TI. Frequencies used were 3505, 3740, 3755, 3995 and 147.33 Mc. VE7DH says only one thing bothers him: how did controls keep on operating at ground zero after a fifty kiloton bomb exploded?

### **Colorado**

W0TVB, EC for Mutual Aid Area No. 10 in Northwestern Colorado, reports operation from the Moffat County Courthouse in Craig, using his transmitting equipment and call. Activity commenced at 0900 MST, with total operation of 15 hours before the test terminated. Contact was maintained sporadically with state control at Denver, handling nine outgoing and ten incoming messages. W0SJJ was active from Steamboat Springs, Colo. All amateurs taking part were AREC members. Operation was completely on auxiliary power for one hour. The EC gives full credit to members of the Yampa Valley Radio Club, all AREC members, for all equipment and improvements, including the installation of the civil defense director himself. He says, "We are proud of the accomplishments we have made — so far."

### **Connecticut**

In Manchester, 18 operators were asked for but 24 signed up to keep the control station open for

W4CDA, Kentucky SEC, hands a message to Judge Gilbert White, Deputy Director of Kentucky Department of Civil Defense during Operation Alert. At left is Col. Thomas J. Quinn, Coordinator of State Mobile Support Groups. The Boy Scout runner in the center is Jimmy Richardson. Photo courtesy *The State Journal*, Frankfort, Ky.

A partial shot of Connecticut's Area I RACES Control Station, located at the State Police Barracks in Ridgefield. At this location, six nets were manned by sixteen operators working in two shifts, six hours on and six hours off, during Operation Alert.

the full twenty-six hour period of the drill. Traffic was handled both for the local area and relayed for stations not in good contact with Area Control in Rocky Hill. Civil defense officials were greatly pleased with the amateurs' response.

Connecticut's Area I RACES organization, consisting of 22 towns in Fairfield County, was active to the extent of 180 operators manning 65 stations throughout the 26 hours of the test. The message total was 2700. This is a considerable increase over the 2156 total for 1954, indicating both the increased efficiency and expansion of the organization. Traffic was handled at the rate of 104-per-hour or 1.7-per-minute throughout the entire test period. Area I Radio Officer W1DBM spent most of the time traveling from one local control to another to visit, inspect and take pictures. Many of the control centers had a full staff of service chiefs on duty, while others had only skeleton crews. W1DBM opines that although the performance in Area I was outstanding, it would be inadequate in the event of a real bombing, the 2700 messages being but a drop in the bucket compared with the actual need.

#### **Delaware**

For the first time, the Communications Division of Delaware Civil Defense functioned as expected and desired, reports W3DB, Deputy Chief of Communications. RACES operated on 3507.5 kc. and 3580, with local work on 10, 6 and 2 meters. The State control station at Delaware City, New Castle County control at New Castle, Kent County control at Dover and Sussex County control at Georgetown were all alerted and ready to go at the appointed time. The state control station alone handled more than 250 messages during the test. Over fifty amateurs took part.

#### **Illinois**

From DeKalb, Ill., we have a clipping quoting the DeKalb c.d. director as saying that "the mobile communications system set up by the Kishwaukee Radio Club made an excellent showing." Mobiles were organized to patrol various sections of the city, reporting conditions to a central location. W9WTF is the spark-plug.

#### **Indiana**

The Evansville gang was active. A rig on 147.3 Mc. f.m. was used at the control center, Dress Memorial Airport, to control a similar unit located in the "devastated" area. A unit on 29.6 Mc. was used to handle traffic to 20 mobiles be-

longing to RACES members. Ten-meter set-ups were also located at the National Guard Armory and the local taxicab dispatcher's office so that medical units and taxicabs could be dispatched as needed from the control point within the affected area. State-wide communication was conducted on 3910 kc.

#### **Kentucky**

SEC W4CDA reports that Kentucky civil defense was provided with c.w.- and 'phone-net communications for their five Mobile Support Group cities. W4CDA operated the c.w. net on 3600 kc., using equipment set up by State Radio Officer W4MGT. W4TFK, Frankfort EC, operated his own 'phone station. Each station handled approximately 30 test messages.

W4JSH, EC for Lexington, reported on Operation Alert for the Fifth Mobile Support Group. This group handled 65 messages, participation by nineteen stations on 3600, 3945 and 3960 kc. Operating time was from 1815 to 2215 EST. Representation was thus provided for seven of the 25 counties making up the Fifth Mobile Support Group.

#### **Louisiana**

SEC W5IUG reports that eight ECs reported participation, plus the SEC and SCM, and that 69 amateurs took part throughout the state.

#### **Maryland**

In Baltimore, 165 amateurs participated. Radio Officer W3NNX and his assistant, W3YYB, quickly alerted and activated all stations with such good effect that Col. Milani, c.d. director for the city, said, "This group, following amateur tradition, fulfilling a most important function, seriously, calmly and expeditiously carried out their duties in a professional manner."

St. Mary's County amateurs also report participation. W3BUD moved his 75-meter station to county c.d. headquarters at Leonardtown, maintaining a circuit to W3CBW at state c.d. headquarters during the alert. In addition, a county net of six stations on another frequency was established. W3AVL's kilowatt proved effective in relaying to state Hq. on occasions. W3ZZK/m located and delivered traffic to a c.d.

(Continued on page 130)

# YL NEWS and VIEWS

BY ELEANOR WILSON,\* W1QON

## Young Ladies' Radio League First International Convention

Judging from reports received, the YLs who attended the Young Ladies' Radio League's First International Convention will long remember the precedent-setting affair. The convention is reported here in considerable detail so that those YLs who were not able to be there in person may catch the spirit of the affair. Thanks are due to Mary Brandvig, W6LBO, Convention Publicity Co-Chairman, for furnishing most of the information.

On Friday afternoon, June 24th, the three-room suite engaged by the YLRL at the Miramar Hotel in Santa Monica, Calif., bulged with registrants. The club photograph albums and scrapbooks were on display and continuous rag-chewing was in order.

At the business meeting Saturday morning, Mildred Griffin, W6PJU, past-president of the Los Angeles YLRC, presided as official hostess. Each YL was given a bracelet of copper coiled links with YLRL insignia, on which Martha Edwards, W6QYL, and her committee — K6s EJE and GMX, and W6s DXI, PJU, and QGX — had worked since fall. Souvenir program booklets in the official club colors — silver and blue — were distributed.

General Convention Chairman Maxine Willis, W6UHA, opened the meeting with a welcome and introduction of

\*YL Editor, QST. Please send all news notes to W1QON's home address: 318 Fisher St., Walpole, Mass.

\*All officers were in office at the time of the convention, which occurred only a few days before a new term began (July 1st). A new slate of officers now rules.

Seated at the banquet table with General Chairman of the Convention, Maxine Willis, W6UHA, and YLRL President, Vada Letcher, W6CEE (first two seated on left) are several honored guests. (Standing, l. to r.): Jeanne Collins, KL7RN, of Minchumina, Alaska; Walter Joos, W6EKM, ARRL Director of the Southwestern Division; John Reinartz, K6BJ, guest speaker; Bernard Linden of the Los Angeles office of the FCC; and veteran YL Elizabeth Zandonini, W3CDQ. (Seated, l. to r.): W6UHA; W6CEE; Mildred Griffin, W6PJU, past-president of the Los Angeles YLRC; Grace Dunlap, KZ5DG, visitor from the Canal Zone; and Gilda Shoblo, W6KER, YLRL Vice-President.

YLs from the following areas: W3, 5, 6, 7, 8, and 0, KZ5 and KL7.

The importance of communication in today's world was stressed in an address by the Mayor of Santa Monica, the Honorable Ben Benard.

## Business Meeting

President of the YLRL, Vada Letcher, W6CEE,\* conducted a brief business meeting, which included the reading of reports from her officers. The report of Publicity Chairman, Gloria Matuska, W9YBC, was read in absentia by W6LBO. W3PVH, Betty Frederick, delegate from W3UUG, Miriam Blackburn, Secy.-Treas., read the financial report, which revealed a treasury balance on June 1, 1955, of \$964.35. Vice-President Gilda Shoblo, W6KER, reported on contest activity during the year and requested that suggestions regarding the conducting of contests and activities be forwarded to the new Vice-President, W9YBC. W6CEE thanked each member and officer for the coöperation extended to her and expressed the hope that the new President, Cris Bowlin, W9LOY, and all of the other officers would receive the same consideration.

The First and Second Vice-Presidents of the YLRL, Carol Witte, W6WSV, and Enid Aldwell, W6UXF, spoke of the history and development of the organization, from its beginnings in 1939 to the present day. Greetings were given by W5RZJ, W6NZP, W6MWU, and W1QON (the last a written message read by W6KER).

Honorary membership for life in the YLRL was conferred on Ethel Smith, W3MSU, YLRL founder and first President. An acoustic, composed and hand-worked by Vi Grossman, W2JZX, was to be sent to Ethel.

The YLRL song, with words by Dorothy Willett, W8UDA, was sung in unison and led by Betty Wilson, W6REF. Betty also sang a new YLRL Convention song, with words and music by W6UHA.

Three convention tickets were awarded — one to W5RZJ, who won the Membership Contest, one to W6WSV, who was the member with the highest individual score in the Los Angeles YLRC, the club which had the greatest number of new members. The third ticket was awarded to KZ5DG, Grace Dunlap, as a representative of the area which had the greatest percentage of membership increase during the past year.

Five special gilt-trimmed YLRL certificates were awarded to W4JCR, Anita Bien, for outstanding work in revising the club Constitution and By-laws (see W4 YL photo elsewhere in this department); to W6NAZ, Lenore Conn, for her excellent work in editing and publishing the YLRL

Directory; to W6UHA for her efficient organization of the convention; and to W6LBO and W9YBR for their nationwide campaign of publicity for the YLRL.

### Reception

After the business meeting, the group adjourned to the Palm Room of the hotel, where anthurium, orchids and ti leaves, flown from Hawaii by W6SHR's OM, provided a tropical background for the miniature ceramic ham shacks made by W6MFP, Agnes Langevin, Decorations Chairman. Jayne Dynes, K6GMX, had assembled and soldered a variety of antenna arrays which stood over the little ham shacks. One of the little shacks, with a three element 20 meter beam, duplicate of W6UHA's station beam, was wired for a lamp as a gift to Maxine from the Los Angeles YLRL.

Presentation of leis from members of the Honolulu YL club, flown from that city by arrangement of KH6AFN and W6SHR, was done in the Hawaiian manner with 88s from W6KER to W6CEE, W6UHA, and to each new district chairman or her proxy.

Fashions from a near-by clothing salon were modeled. While Martha Edwards, W6QYL, modeled the wedding gown she made of the silk brocade her recent bridegroom, W6RDQ, brought from Japan, Lenore Conn, W6NAZ, narrated the story of their courtship and wedding.

Elizabeth Zandonini, W3CDQ, and Evelyn Scott, W6NZP, recounted meetings with overseas YLs during recent travels abroad. KL7RN and KZ5DG spoke on YL activities in Alaska and in the Canal Zone.

### Banquet

Hundreds of Hawaiian orchids, tall green tapers, and giner leis decorated the tables for the evening banquet. W6UHA was mistress of ceremonies. Each YL banquet guest was presented with a certificate designed by W6KER and W6MFP, making the recipient a charter member of all future YLRL Conventions.

A talk on the early days of amateur radio by John Reinartz, K6BBJ, was one of the features of the evening. Mr. Reinartz declared that he was especially happy to speak on the occasion, for after thirty-five years of married life, his wife had recently become Novice KN6MJH.

Enid Aldwell, W6UXF, and her Bavarian Dance Group, entertained with colorful and authentic dances of Bavaria.

Bernard Linden, Engineer-in-Charge of the Los Angeles area office of the FCC, brought a message of congratulations and clippings of early-day YLs from his personal scrapbook.

Although many YLs had to leave after the main convention events on Saturday, a number remained in the area and visited the homes of Los Angeles YLs and attended a mobile caravan to CBS-TV City on Monday, arranged by Mary Kay, W6JMC.

And thus the first international convention of the YLRL came to an end.

The convention is significant not only of the progress of the YLRL—it reflects the increase in numbers and activity of YLs in general. A few years ago a convention of this sort could not have occurred. Now the question is when and where is the next one going to be? With the example of hard work and enthusiasm displayed by the YLs of the Los Angeles YLRL, the way points to bigger and better YL get-togethers in the future.

### Yls in Attendance

A list of the eighty YLs who registered at the Convention follows:

W3s CDQ, PVH; W5s CGE, RZJ, SYL, WUE; JN7VWU, W7s GXI, KOY, LCS, PUV, SBX, SNP, ULK; W8UAP, WN8TAU K0VTY, ex-W3LSX; W0s ERR, PIK, TYB; KL7RN; KZ5DG.

K6s ACF, ANG, AYJ, BUS, BXX, CYZ, DRS, EIA, EJE, EIA, EXV, GQW, HMP, JCL, KCI; KN6s HIW, HRW, JHD, JRL, KEK, LPM, MJH; W6s AKE, AVF, BDE, CEE, DPB, DXI, EHA, FEA, GAI, GMX, HEG, IWG, JCA, JMC, JZA, KER, KYZ, LBO, MFP, MWU, NAZ, NZP, PJU, QBK, QGX, QMO, QOG, QOO, QYL, REF, SGL, SHR, UHA, UXF, WRT, WSV.

Total attendance, which included YLs, OMs, and invited guests, was one hundred forty-seven.

### Convention Committee

Convention Chairman: Maxine Willis, W6UHA.

Official Hostess: Mildred Griffin, W6PU.

Business Manager: Evelyn Scott, W6NZP; Helene Leonard, W6QOG.

Decoration: Agnes Langevin, W6MFP; Jayne Dynes, K6GMX, Lorraine Joslin, W6SIIR.

Favors: Bracelets: Martha Edwards, W6QYL; Harryette Barker, W6QGX; Frances Staben, K6EJE; Jayne Dynes, K6GMX; Gladys Eastman, W6DXI.

Certificates: Gilda Shoblo, W6KER; Agnes Langevin, W6MFP.

OMs' Entertainment: Maxine Willis, W6UHA; Lenore Conn, W6NAZ; OM Lee Eastman; OM Ralph Blakesley.

Prizes: Ann Joyce, W6KYZ.

Program: Harryette Barker, W6QGX; Gladys Eastman, W6DXI; Vada Letcher, W6CEE.

Publicity: Mary Brandvig, W6LBO; Gloria Matuska, W9YBC.

Reception Transportation: Lorraine Freeberg, W6AKE.

Reservations: Elsa Wheeler, W6JZA; Billie Blakesley, K6ANG.

### Keeping Up with the Girls

W1VXC, June, has formed a ten-meter net to facilitate delivery of traffic in Rhode Island. . . . Along with her election as W4 YLRL chairman, W4BLR, Kay, made A-I Operator Club and gave birth to her fourth child (she complained when she fell short of traffic totals required for her third straight BPL). . . . W1VOS, Marge, noted W1s UQA, UBMI, VVS, KN1EIW, and KN2KFB at the New London hamfest. . . . W1SVN, Millie, has joined the ranks of a number of YLs who are policewomen. . . . Four of the girls in W2IQP's training class have passed the Novice exam and are awaiting calls. . . . K2s AHG, DJN, IYP and W2NAI are regular members of the Second Regional 'Phone and Interstate 'Phone Nets. . . . The new address of the YLRL Sixth District chairman, Gertrude Cassady, W6FEA, is 121 Altana St., San Rafael, Calif.

Twenty-three YLs registered at the first YLRL convention in the Fourth District, held in conjunction with the ARRL Southeastern Division Convention. This YLRL meeting was sponsored by the SPARCYS (St. Petersburg Amateur Radio Club YLs). ARRL President Dosland, W0TSN, presented W4JCR, Anita, with a Certificate of Merit, sent to her from YLRL President W6CEE in recognition of outstanding work on the club constitution and her long years of service to the YLRL. Here are the 14 YLs who attended the YLRL breakfast: (standing, l. to r.): KN4CUY, W4s BAV, GNZ, AVA, Minnie Smith, W4s BIL and WPD. (Seated, l. to r.): W4s GJU, UNO, RLG, JCR, TDK, ZVW, HRC.

# • On the TVI Front

## TVI IN GREAT BRITAIN

The Engineering Department of the GPO (Government Post Office) of Great Britain has released recent figures on TVI and BCI in that country. The GPO is the British equivalent of our FCC. Figures shown were extracted mainly from an editorial appearing in the *R.S.G.B. Bulletin* and partly from *The Short Wave Magazine*, British amateur publications.

Interference Caused by Transmitters	
Amateur	Others
BCI — 125	BCI — 142
TVI — 303	TVI — 476

Other TVI offenders were:

- 8956 sewing machines
- 7056 commutator-type motors
- 6954 hair dryers
- 1064 TV receiver local oscillators

The GPO classified 21,877 TVI cases under the all-embracing category "unknown." Also, 6805 instances of BCI were recorded as caused by TV receiver time-base circuits.

## INTERFERENCE COMMITTEE DIRECTORY

The Southern California Electronics Interference Committee publishes "Coöperative Interference Committee Directory." This pamphlet, compiled under the supervision of Ray E. Myers, W6MLZ, contains valuable information for TVI committee members as well as other groups.

To be found in this booklet are three lists. The first is an index of those participating in the program. It gives addresses and also home and office telephone numbers where authorization to do so was received. The second shows the geographic location of the participants. The last is a compilation of the various interests of those taking part.

Also included is an investigation report form. Its purpose is to show sufficient data so as to indicate quickly causes and corrective measures on future reports called to the committee's attention.

## LATEST TVI COMMITTEE LIST

The following is the latest FCC roster of TVI committees. It is interesting to note that since March 1, 1954, 95 new committees have been organized, bringing the total to 437. These committees now serve 412 cities as compared to 328 as of March 1, 1954. Such progress is indeed gratifying and statistics indicate that much credit should be given to those responsible for this accomplishment.

- Alaska:* Anchorage, Fairbanks.
- Alabama:* Anniston, Birmingham, Huntsville, Mobile, Montgomery.
- Arizona:* Phoenix, Tucson.
- Arkansas:* Fayetteville, Ft. Smith, Little Rock.
- California:* Alhambra, Arcadia (2), Bakersfield, Baldwin

Park, Burbank (2), Camarillo, Coronado, Covina, Downey, Dunsmuir, East Bay, Edwards Air Force Base, Encino, Fresno, Fullerton, Glendale, Hayward/San Leandro, Hemet, Inglewood, Lakewood, Lancaster, Long Beach, Manhattan Beach, Marin County, Marysville/Yuba City, Merced, Modesto, Monrovia, Monterey Bay, Mt. Diablo, North Bay, North Hollywood, North Peninsula, Norwalk, Oakland, Orange County, Oxnard, Palo Alto, Pomona/Ontario, Richmond, Sacramento, San Bernardino, San Diego, San Fernando, San Francisco (5), San Mateo, San Pedro, Santa Ana, Santa Clara County, Sonoma County, South Pasadena, Stockton, Taft, Turlock, Ventura, Westchester (in City of Los Angeles), Whittier, Woodland.

*Connecticut:* Darien, New Haven, Norwalk, Norwich, Waterbury.

*Colorado:* Alamosa, Boulder, Colorado Springs, Denver, Grand Junction, Greeley, Pueblo.

*Delaware:* Wilmington.

*District of Columbia:* Washington.

*Florida:* Bradenton, Clearwater, Daytona Beach, Ft. Lauderdale, Ft. Walton Beach, Jacksonville, Key West, Lakeland, Miami, Orlando, Pensacola, Sarasota, St. Petersburg, Tampa, West Palm Beach.

*Georgia:* Albany, Atlanta, Augusta, Hapeville, Macon, Marietta, Savannah, Warner Robins.

*Hawaii:* Honolulu, Hilo, Lihue, Kauai, Wailuku, Maui.

*Idaho:* Boise, Kellogg, Nampa, Twin Falls.

*Illinois:* Alton, Belleville, Berwyn, Broadview, Chicago, Creve Coeur, Decatur, Des Plaines, East Moline, East Peoria, East St. Louis, Freeport, Galesburg, Granite City, Hollywood, Maywood, Moline, Morton, North Riverside, Pekin, Peoria, Princeton, Rock Island, Silvis, Villa Park, Western Springs, Wheaton.

# Results—Armed Forces Day 1955

**A**N Armed Forces Day message to amateur radio operators signed by the Honorable Charles E. Wilson, Secretary of Defense, was transmitted at 25 w.p.m. by military stations AIR, Air Force Radio Washington, D. C., NSS, Navy Radio Washington, D. C., and WAR, Army Radio Washington, D. C., at 1900 EST on May 21st. There were 305 individuals participating in this phase of the special activities of which 233 operators have been mailed certificates of merit in recognition of their making perfect copy.

## Message from the Secretary of Defense

ARMED FORCES DAY IS THE ONE SPECIAL DAY OF THE YEAR DEVOTED TO PUBLIC DISPLAYS AND DEMONSTRATIONS OF THE TEAMWORK AND TECHNOLOGICAL ADVANCEMENTS OF THE ARMED FORCES OF THE UNITED STATES COMMA INCLUDING NOT ONLY THE ARMY COMMA NAVY COMMA AIR FORCE COMMA MARINE CORPS AND COAST GUARD COMMA BUT ALSO THE RESERVE COMPONENTS AND AUXILIARY SERVICES PERIOD AMATEUR RADIO OPERATORS COMMA WHO HAVE WORKED TOGETHER SO EFFECTIVELY IN PROVIDING AUXILIARY COMMUNICATIONS FOR DISASTER RELIEF AND IN OTHER EMERGENCY SITUATIONS COMMA HAVE A PLACE IN OUR NATIONAL DEFENSE SYSTEM PERIOD ACCORDINGLY COMMA ON BEHALF OF THE ARMED FORCES OF THE UNITED STATES COMMA I CORDIALLY INVITE AMATEUR RADIO OPERATORS TO PARTICIPATE IN THE 1955 ARMED FORCES DAY PROGRAM PERIOD SIGNED C E WILSON

Entries were also received from radio operators aboard two ships at sea, French Morocco, Hawaii, Guam and Alaska. Certificate winners are as follows:

W1s OIG BIH AXZ RFC YGV AIJ MIJE JVZ ONP UNC TUI BJP DWO IKE SDO UTH, W2s ALZ JOA MZB JRS WZO NYB DRV CDG JCA FXA ALD TUK QDY LYH CLQ LRW SSC SWC UAP VPH WFL ZMK, K2s WAS ECL DRY GTZ, W3s YWO ADE TSG ZTW JPW ID ZJ OKS QCB JEI BKE AXS ECP FFN PMG QLQ QOJ, W4s IYT KSW SDR KJ MPA RHZ ZPR OFM OXX YTT AQM HRD DEQ PVW CVO LYV PHL SR, K4s BTA/3 ASU, W5s NIY NW NDV HUC LB OFX YOK WNU GPB JPC TGV YMX BI CYE HBD JQU UPM, K5FFR, W6s MBW ZLF DVD MWR OWP QIL CGJ MCY BXL FYW FYN CRT RYR AXV DTY AXQ NAZ ULL YY, K6s CME DSK CFC HSO EJZ NAA, W7s EBS FOS CZY NZP FIX WOK WHE BJY BVZ RML MCU PKX, WN7WYP, W8s ETB RLE QIJ KXN SZU DGI FLA HSW PYB, W9s ANB BA STZ UBW HAC AKP FAM DHJ BP CXY DPL HVP JUJ, W0s TKX CGY FEO EOT QVA UAT PIV WYV NHZ UQM NIY, KG6AFT, KH6s DG FX, KL6JJ, WL7BHC, VE3IA, A2QNND, A7KBV, A9VYD, N3s NCF EAC.

Also C. P. Alexander, M. W. Anderson, Charles A. Armbrust, Wm. J. Beetham, Charles Blake, Richard B. Bradley, Earl L. Brouillette, James R. Burns, Cmdr. C. J. Corrigan, Richard G. Edwards, Maj. Allan C. Forbes, Thomas Galbreath, Lars Giertz, Jim Gilbreath, L. W. Guertin, Gaither M. Hilton, Robert C. Holland, Jack Howell, Dwane O. Howington, Wayne D. Hudson, June

Olson, Edward V. Phillips, George E. Reynolds, Reinman, Stanley E. Rivett, R. L. Simpson, Frederick W. Staff, I. I. Stokes, E. L. Stough, James G. Tibbetts, G. R. Turner, L. M. Vane, G. R. Walter, George F. Wanish, C. E. Watson, Bernard Weeks, Robert Wixon.

## Military-to-Amateur Test

Operating on military frequencies, AIR, NSS and WAR worked amateurs on the 80-, 75-, 40-, and 20-meter bands. The three military stations made a total of 564 QSOs with amateurs during the six-hour test. Special Armed Forces Day QSL cards have been mailed to all stations worked. It was possible to receive three cards by working all three stations.

## Radioteletypewriter Receiving Competition

There were fifty-two participants in radioteletypewriter competition this year and 27 of this number made perfect copy. A letter of acknowledgment has been mailed to each participant. All suggestions received for improving and creating interest in this phase of Armed Forces Day will be taken into consideration during the forthcoming year.

The Army, Navy and Air Force look forward to your participation in these activities next year on Armed Forces Day.

## STAFF OPENING

We have a permanent opening for a young man to do general editorial and production work on the *QST* staff. Here is a chance to make amateur radio your career. The work requires the ability to express yourself both orally and on paper, and will later involve a modest amount of travel. Any applicant should be one with initiative and should be able to assume administrative responsibility readily.

We'd like someone about 25, preferably single, of pleasing personality, with at least a couple of years of ham experience under his belt; mostly someone who has had some publishing or writing experience. Salary will be commensurate with ability and background.

If you are interested, write to Box 80, ARRL Hq., West Hartford, Conn. State your age and marital status, and give a résumé of your educational and employment or military background; also your amateur experience.

# June V.H.F. Party Summary

## *Scores and Activity Set Many New Records*

PICK any category in which v.h.f. contests can be compared, and the chances are good that the June V.H.F. Party of 1955 will rate a record. The festivities of June 11th and 12th resulted in a new high in participation, with 455 valid entries, compared to a previous record of 370 for any of the spring-fall contests. There were many more portable and multiple-operator stations, as clubs more and more make use of the June Party as a test of Field Day facilities. The advent of Technician licensees on 50 Mc. brought a new surge of life to that band, and the number of operators using 6 was up 60 per cent over last June. More ARRL sections (55) were heard from than in any previous v.h.f. activity, and the scores of both individual operators and groups broke all records.

The highest total ever posted in a v.h.f. contest was turned in by the Waltham Amateur Radio Association, W1MHL/1. Operating from Pack Monadnock Mountain, near Peterboro, N. H., as they have in every party for years, the Watch City club made 97 contacts on 50 Mc., 243 on 144 Mc., 15 on 220 Mc., and 10 on 420 Mc. Their section multiplier, a staggering 43, netted them 16,770 points. Taking their single-band totals, we find them leading the country on 50, 220 and 420 Mc. The 2-meter job of W1PYM, who ran the 2-meter position throughout the contest, was second in the country for 2-meter work. His 3157 points (figured on the basis of 2-meter operation only) was exceeded in that category only by W3IBH.

The top single-operator score was made by W2FBZ, Montclair, N. J. Lee won the Northern New Jersey Section Award again with 233 contacts on 4 bands. Her section multiplier of 34 brought this to 8534 points, another record. Right behind Lee in the home-station category was W1RFU, Wilbraham, Mass., with 211 con-

tacts on 50, 144 and 220 Mc., for 7548 points. W3KKN, Willow Grove, Pa., made the most contacts of any single-operator station, 251 on 6 and 2 meters, for 5522 points. His neighbor, W3IBH, Philadelphia, worked 220 stations in 15 ARRL sections for 3300 points, the country's high one-band effort.

The San Bernardino Microwave Society, W6VIX/6, hung up three marks for groups to shoot at in future contests. Operating from Sierra Peak, near Corona, Calif., they made an even 400 contacts, 306 of which were on 144 Mc., for a new Western record of 6165 points. They used 50, 144, 220, 420, 2400 and 3300 Mc., but they say that this is only the beginning. Their u.h.f. and microwave gear is going to be much more effective for the September Party. Congratulations to operators W6VIX, W6JMY, K6GMV, and K6HXM for demonstrating that a West Coast station can be right up among the leaders, despite the handicap of geographically immense ARRL sections.

Dozens of other portable stations contributed mightily to the fun. K2CMB/2, Paterson, N. J., posted the next to the highest single-operator score, 7714 points, on 50, 144, and 220 Mc. with his trailer station. W3KX/3, the Electric City Radio Club, maintained their customary leadership in the Eastern Pennsylvania Section with 8103 points made on four bands. W1UIZ/1, Mt. Equinox, Vermont, put that hard-to-get section within the reach of many, working 50, 144, 220, 420, and 3300 Mc. His sole contact on 3300 was with W1IUN/1, who used gear built in 1947, with which he made what may have been the first amateur contacts on that band.

Scores of Technicians, using 50 Mc. for the first time in a contest, kept that band jumping with activity. Oddly enough, no Technician qualified for an award, however, as there were no

Members of the San Bernardino Microwave Society operating W6VIX/6 in the June V.H.F. Party made an even 400 contacts on 50, 144, 220, 420, 2400 and 3300 Mc. K6GMV, left, runs the 420-Mc. gear, while K6HXM supervises the 2400-Mc. tests being made by W6JMY. The W6VIX/6 score, 6165 points, was an all-time high for a station outside the small-section East, and their contact total was the highest in v.h.f. contest history.

instances where the necessary three entrants in that category were received from any one section. Note to Technicians: Be sure to show your class of license on future contest reports, and bear down on 6 in the September Party. W1ZW/1, Paxton, Mass., was the country's leading Technician, and the top 50-Mc. operator, as well, with 90 contacts in 13 sections, for 1170 points. This was done without benefit of sporadic-E skip, as the band remained closed throughout the contest, as far as the W1s were concerned.

The 50-Mc. band opened in other areas, however, and some nice scores were turned in as a result. W7OAY/7 knocked off 36 W6s in a 3-hour  $E_s$  session Saturday. Their 1703-point total is believed to be the first 4-digit v.h.f. score ever turned in by a station in the Northwest. They made 129 contacts on 50, 144, and 420 Mc.

A study of the pile of logs brings out many facets of the contest that don't show in the score tabulation. W6OHQ/6, Mt. San Benito, 210 miles northwest of Los Angeles, worked all eight California sections on 144 Mc. K6GVB, Ukiah, Cal., worked 29 stations in four sections, all of which are more than 50 miles distant. Ukiah is in the northern part of California, with mountains in all directions. W2TKO handled emergency traffic for an hour following a CAP crash and breakdown of CAP communications facilities. W3TDF soldered the last connection on antenna systems on his new tower minutes before the start of the contest, and went on to make 203 contacts in 22 sections, for 4466 points. W2UK, taking his last fling at the 2-meter band before dismantling his station for shipment to the Hawaiian Islands, worked 127 stations in 19 sections on 144 Mc. We reported this last month, tentatively, as the best section total made on 144 Mc., but now we find that W2CXY was giving a new 50-element array the acid test in the party and duplicated Tommy's section total.

## SCORES

In the following tabulation, scores are listed by ARRL Divisions and Sections. Unless otherwise noted, the top scorer in each section receives a certificate award. Columns indicate the final score, the number of contacts, the section multiplier, and the bands used. A represents 50 Mc.; B, 144 Mc.; C, 220 Mc.; D, 420 Mc.; E, 1215 Mc. and above. Multiple-operator stations are shown at the end of each section tabulation.

# V.H.F. QSO Party

September 17th-18th

Another V.H.F. QSO Party, open to amateurs who can work any band or bands above 50 Mc., will be held from 2:00 P.M. Local Standard Time, Saturday, September 17th, to 11:00 P.M. Local Standard Time, September 18th.

Call "CQ Contest" or "CQ V.H.F. QSO Party" to get in touch with other contestants. During contact, operators must exchange names of their ARRL sections for full credit.

Work as many stations on as many v.h.f. bands as you can. Count 1 point for successfully confirmed exchanges of section information on 2 or 6 meters, 2 points for such QSOs on 220 or 420 Mc., and 3 points on 1215 Mc. or higher bands. To determine your final score, multiply this sum of contact points by your section multiplier, which increases by one when the same section is reworked on another band. A station may also be reworked for credit on additional v.h.f. bands.

A certificate will be awarded to the top scorer in each ARRL section. In addition, a certificate will go to the high-scoring Novice, Technician, and multioperator station in each section from which three or more valid entries in these three special categories are received.

Submit your results as soon as the competition is over. A simple tabulation of stations and sections worked, as shown on page 60 of June, 1953, *QST*, is all that is required. Convenient reporting forms are now available from ARRL.

## Rules

1) The contest starts at 2:00 P.M. Local Standard Time, Saturday, September 17th, and ends at 11:00 P.M. Local Standard Time, Sunday, September 18th. All claimed contacts must fall within this period and must be on authorized amateur frequencies above 50 Mc., using permitted modes of operation.

2) Name-of-section exchanges must be acknowledged by both operators before either may claim contact point(s). A one-way exchange, confirmed, does not count; there is no fractional breakdown of the 1-, 2- or 3-point units.

3) Fixed-, portable- or mobile-station operation under one call, from one location only, is permitted. A transmitter used to contact one or more stations may not be used subsequently under more than one other call during the contest period.

4) Scoring: 1 point for completed two-way section exchanges on 50 or 144 Mc.; 2 points for such exchanges on 220 or 420 Mc.; 3 points for such exchanges on the higher v.h.f. bands. The sum of these points will be multiplied by the number of different ARRL sections worked per band; i.e., those with which at least one point has been earned. Reworking sections on additional bands for extra section credits is permitted. Cross-band work does not count. Contacts with aircraft mobile stations cannot be counted for section multipliers.

5) A contact per band may be counted for each station worked. Example: W2GLV (S.N.J.) works W1DBM (Conn.) on 50, 144 and 220 Mc. for complete exchanges. This gives W2GLV 4 points (1 + 1 + 2) and also 3 section-multiplier credits. (If W2GLV contacts other Connecticut stations on these bands, they do not add to his section multiplier but they do pay off in additional contact points.)

6) Each section multiplier requires completed exchanges with at least one station. The same section can provide another multiplier point only when contacted on a new v.h.f. band.

7) Awards: A certificate will be awarded to the high-scoring single-operator station in each ARRL section. In

addition, the high-scoring multiple-operator station will receive a certificate in each section from which three or more valid multiple-operator entries are received. Certificates will also be given to the top Novice and Technician in each section where three or more such licensees submit logs. Award Committee decisions will be final.

8) Reports must be postmarked no later than October 5, 1955, to be eligible for awards. See the box on page 60, June, 1953, *QST*, for correct form, or a message to Headquarters will bring a lithographed blank for your contest report.

# W/VE Contest

September 24th-25th

The annual W/VE Contest, sponsored by the Montreal Amateur Radio Club, will be held from 6 P.M. EST, September 24th, to 11:59 P.M. EST, September 25th. The rules are the same as those of last year. Amateurs in the U. S. A. will be trying to trade contest exchanges with as many Canadians in as many provinces and territories as possible; VE/VO stations will

"Forwarded annually to the highest point scorer (in the W/VE Contest) to foster and promote increased radio communication activity between amateurs in the United States and Canada," is the inscription on this handsome trophy donated each year by Emerson Radio of Canada, Ltd. Winner in 1954 was VE6VK.

be searching for amateurs in the ARRL sections in the U. S. A. A sample message, as originated by a W6 in Los Angeles section, might appear as follows: NR 1 W6XXX 579 LA. VE2BB, MARC contest chairman, urges participants to read the rules carefully and maintain neat logs so that the results can be presented quickly and accurately.

## Rules

1) Any station located in any ARRL section as listed in *QST* (page 6) is eligible to enter.

2) All contacts must be made during the contest period from 6:00 P.M. EST, September 24th, to 11:59 P.M. EST, September 25th, with a total of no more than 20 hours operating time for each entry. Times on and off the air must be clearly shown in the contest log.

3) Exchanges such as the following must be exchanged and be fully recorded in the log entered: (1) number of

(Continued on page 114)

CONDUCTED BY EDWARD P. TILTON, WIHQ

WHEN 2-meter DX beyond 1000 miles or so is worked, a discussion usually follows as to the mode of propagation. Was there a reflection from an ionospheric layer, 50 miles or more above the earth, or did the signal follow earth curvature throughout the route as the result of favorable conditions in the lower atmosphere? There seems little doubt that both modes have produced DX on 144 Mc., but the distances over which they make communication possible overlap to some extent.

For a time the possibility of ionospheric DX on 144 Mc. was questioned, but several examples of long-distance work seem to have been of this nature. One of the first was the 1200-mile contact between W8WXV and W5VY, in June, 1950. This came at a time when the 50-Mc. band was boiling with sporadic-E skip, and weather conditions along the path were not such as to encourage tropospheric propagation. In June a year later a whole string of Texas-California contacts were made. W6ZL and W5QNL set the 1400-mile record that still stands, but several other stations worked similar hops only a few miles shorter. Here again, the 6-meter band was going strong, and there was extensive thunderstorm turbulence along the route that would appear to rule out tropospheric propagation.

On the other hand, just about every September we have one or more 2-meter openings of major proportions when there is no evidence of sporadic-E skip on lower frequencies. The W2BAV-W0DSR contact of September, 1950, was in the 1200-mile range, and W2BAV was heard out to more than 1400 miles on that occasion. There have been contacts beyond 1000 miles under similar conditions every fall since. The question then arises, how to tell when favorable conditions for 2-meter DX exist, whether for  $E_s$  or tropospheric propagation?

Often during the early summer DX season on 50 Mc. we hear 6-meter stations arranging checks on 2. Practically all of these fail, but once in a blue moon one pays off. Such a check by W5AJG, Dallas, Texas, started the 1951 session with

stations in the Los Angeles area. Leroy did it again on July 3rd of this year; this time with W7LEE, Parker, Ariz. They worked on 6 and then changed to 2 at 1242 CST, continuing the contact successfully on c.w. on the higher band. The 144-Mc. c.w. signal of W5AJG was heard by W7JU, Boulder City, Nev., at this time. W5AJG made similar checks with W5LFH, Sandia Park, N. Mex., and W4CVQ, Raleigh, N. C., without success. The following day W7LEE heard unidentified 2-meter signals from the East again.

The W5AJG-W7LEE path is about 1020 miles, which we suspect is near the minimum over which  $E_s$  work is likely to be done on 144 Mc. W5LFH, under 600 miles, was undoubtedly too close. W4CVQ is about the same distance as W7LEE, but ionization density was probably greater on the western path. W5LFH and W5SFW, Amarillo, Texas, worked on 50 Mc. that day, with both beams aimed west. As they are only 220 miles apart, a high-density cloud to the west is indicated.

In looking for 2-meter DX prospects on 6, we should not be fooled by extremely strong signals on the lower band at 500 to 1000 miles. A wavy signal on 6 at 1200 miles might be a

◆  
New array on the way up at VE3DIR, Toronto. Two years of planning went into this "nest" of 20-element arrays for 144, 220 and 420 Mc. The steeplejack is W2ALR.  
◆

W2QCY/7 in operation on 50 Mc.  
near Wendover, Utah.

much better bet, especially if signals much closer in are heard at the same time. If 50-Mc. stations under 300 miles away are heard by the ionospheric route (that is, during a hot opening, with signals showing  $E_s$  characteristics) there may be a chance of 2-meter work over much longer hauls. But don't waste much time making tests with some big-signal 6-meter man 700 miles away under such circumstances; your best prospects will most likely be beyond 1100 miles distant. And they will be south of Winston-Salem, Nashville, Tulsa, the Grand Canyon, and San Francisco, if past experience in this department means anything.

The chances for sporadic-E DX on 144 Mc. will be slim until early next summer, but the fall tropospheric DX season will be just getting under way by the time this issue is mailed. This kind of DX knows no geographical bounds, in the early fall, at least. A close watch of nationwide weather conditions and frequent monitoring of TV Channels 7 to 13 (with a good receiver and high-gain antenna system) will provide the best indications of the possibility of DX on 144, 220 and 420 Mc. during this season. The lower TV channels and the amateur 50- and 28-Mc. bands are of little help in establishing one's chances for v.h.f. DX during the fall months.

### 50-Mc. Expeditions Pay Off

A 6-meter bull session last February resulted in one of the most pretentious expeditions ever organized for the purpose of providing v.h.f. DX contacts. The laments of New Jersey 50-Mc. operators over the lack of Utah and Nevada contacts on 6 gave W2QCY an idea for a 1955 vacation trip. At least one East Coast 50-Mc. WAS resulted, and scores of calls all over the country were moved one or two more rungs up the WAS ladder.

Planning of the expedition began at once, and from February to June, W2QCY did little else but build and test equipment and scout prospects for driving and operating assistants for the 5000-mile jaunt. A new 50-Mc. home rig was in the planning stages, so the expedition set-up was built in de luxe form, to serve as a permanent home station later on. The result was a transmitter delivering 50 watts output on either c.w. or a.m. 'phone, equipped with gang-

tuned VFO and following stages, speech clipping and filtering, and all metering and operating features necessary for convenient and effective use; yet built in compact enough form to permit installation in Roy's panel truck.

A recruiting program that included mention of the advance plans for the trip in these pages, and much on-the-air talk, was launched early in the spring. It was not easy to find two men who could take the time to make a trip of this sort, though scores of fellows felt the urge. The first likely prospect turned up was Erret "Reb" Allen. His license had lapsed some time ago, but his interest in ham radio was rekindled by talk of the trip. In three weeks he had passed his General Class exam, and as K2ODA became a definite member of the Project Utah staff. The third member, George Whattam, W2CZE, was signed up almost at the last moment.

The cab of the 1949 Dodge panel truck was equipped with reflective-type insulation, and the roof given two coats of chrome paint, in anticipation of desert heat. An operating table was installed in the truck compartment, and all gear readied for use. Luggage carriers on the roof took care of the nine 10-foot TV mast sections and the Telrex 6-element array. Gear for use on 7, 14 and 21 Mc. was installed. Test runs were made, with all gear and operators, to determine their suitability for the job coming up. Letters had been written to several W7s for advice and assistance, and the approximate location was selected for the Nevada-Utah operating.

The expedition left Morristown, N. J., the night of July 17th, and by the morning of the 20th they were ready for a rendezvous with Andy Norgaard, W7UPS, Wendover, Utah! Sites were surveyed and Three-Mile Hill, a mountain just over the state line in Nevada, was selected for the first work. Between then and June 26th, 59 different stations were worked, winding up the Nevada stay with a fine double-hop opening Sunday, the 26th. Eastern stations worked included W3s PCB, MQU, HFY, FPH, W2s MEU, ZKE, KNQ, 1DZ, WCM, UQQ, and K2s BDF and JNS. Contacts were made at the rate of one every 90 seconds through terrific QRN.

The scene of operation was shifted to a saddle between two peaks NNE of Wendover, Utah, on the 27th, from which point 26 stations were raised. Conditions were never so favorable during the three days left for Utah work, and only two eastern stations were worked: W1VNH and W2IDZ. The latter made possible the first 50-Mc. WAS award to a W2. W2IDZ's Certificate No. 11 is the second to be issued to an operator located east of W9. Special QSLs are being prepared and will be sent to all stations worked.

While W2QCY/7 was busy in Nevada, another Nevada expedition very similarly equipped was making hay in Las Vegas. The night of June 26th, W6ABN/7 worked some of the same stations as W2QCY/7, but in addition, many W1s, most of whom had never heard a Nevada signal before. Stan used 100 watts input to an 829B, and a 4-element array mounted about 10 feet above his panel truck. Though he spent most of a three-week vacation in Las Vegas, it was only between June 24th and July 4th that many contacts were made. In this time W6ABN/7 worked 115 different stations in 27 states, all call areas, and VE3. VE3AET, the sole Canadian worked by W6ABN/7, reports that he also worked W6COH/7, near Jean, Nev., on June 25th.

The work of these stations demonstrates that only activity is needed to make any state in the country available to any other on 50 Mc. This is supported by the work of W7JPN, Salt Lake City, and W7QDJ, Clearfield, Utah, who worked many stations throughout the East during July openings. These two are the first Utah home stations to work double-hop sporadic-E DX, and as such they pro-

Calls in bold face are holders of special 50-Mc. WAS certificates listed in order of award numbers. Others are based on unverified reports.

vided many operators with their first Utah contacts. Among the beneficiaries was W1LLL, Windsor, Conn., who worked both for No. 48 on July 16th. One of the country's most consistent 50-Mc. DX hounds, Brownie had been watching for Nevada and Utah constantly for several years. He now holds 50-Mc. WAS Award No. 12.

## Here and There on the V.H.F. Bands

As frequently happens in peak v.h.f. months, a tremendous volume of mail reached your conductor's desk during July. We'll sift it carefully and report interesting tidbits in briefest possible form.

Miles-per-watt record on 50 Mc? On July 10th W2IDZ asked a W4 to look for his transistor oscillator rig, announcing the frequency. The station with whom the test was made did not hear the flea-power signal, but W4QN, Orlando, and W4AYV, Umatilla, Fla., did. Both called Ed to let him know that the 3.6 milliwatts of output had produced readable c.w. signals. Ed figures this as something around 263,000 miles per watt. The rig, built by W2JEP,

W7UPS at the operating position of W2ACY/7. Complete station was designed for the trip from Morristown, N. J., to Utah and Nevada.

has also been used by W2QCY/2, Greenwood Lake, N. J., to work 40 miles on 6-meter ground wave.

It pays to check 6 noontimes if you can. W1VNH, Agawam, Mass., worked W2QCY/7, Utah, during a noon opening when no other signals were audible. He was the only W1 worked during the entire W2QCY expedition.

The trip to Utah and Nevada was so much fun that a Labor Day trip to West Virginia is being planned by the same W2QCY crew. Advance surveys were made, so that the whole week end can be put to best use in providing 50-Mc. contacts with that hard-to-get state. W2QCY/8 will be on about 50.2 Mc. from a high point near Martinsburg, about 20 miles southwest of Hagerstown, Md.

Examples of the big pick-up in 50-Mc. activity: Tennessee stations are heard whenever the band is open in that direction. W4ZBQ says that there are 27 stations on 50 Mc. in the Knoxville area alone. W5HEZ, Baton Rouge, La., worked 85 different stations in one day recently. W1VNH counted 27 Ohio W8s during a July session. W6s by the score have been heard in the East during the better double-hop openings. W8CMS worked 20 states, 8 call areas, July 9th. VE3AET heard or worked 56 stations in 16 states, June 26th. Fifteen-minute tape recording made by W1HDQ on June 26th has 35 different calls in 17 states in evidence. W7OAY/7 worked 36 W6s in the June V.H.F. Party. W0ZJB worked 44 stations in 24 states and all call areas, July 8th.

This brings on a considerable QRM problem, with everyone trying to use the low end of the band. With sparse occupancy of the band, concentration on the first 100 kc. did no great harm, but there just isn't room for everyone there any more. Stations in Channel 2 areas need to work as low in the band as possible, to minimize TVI. W2IDZ suggests that where Channel 2 TVI is not a problem, 6-meter men take it upon themselves to move up in the band, at least during widespread openings. And all of us should tune more of the band than we do. Your conductor, using 50.57 Mc. for mobile work of late, has lost plenty of calls because fellows don't tune that high, even when the band is dead. Too many operators run up to about 50.4 Mc. and give up. Let's use more of it, boys!

That last state for W0DZM, Robbinsdale, Minn., was not Nevada or Utah, but Montana. He nailed this one down with W7JRG, Billings, Mont., July 15th. When that last card comes through, Shorty will be in line for Award No. 13. All 48 were worked with 30 watts input to an 815, which may be the low-power record for 50-Mc. WAS. Two near-misses: W0TKX, who missed the shot at W2QCY/7 and W6ABN/7 by being out on Field Day, and W9VZP, who raised W6ABN/7 just as Stan developed transmitter trouble and couldn't reply.

Six-meter oddity: W8WVP finished his rig and installed his antenna system on July 9th. His first CQ on 6 raised W5ZVF, who had also just finished erecting a beam and putting his station in order in a new location, making his first transmission in calling W8WVP. It was the first Michigan contact for W5ZVF, and the first Arkansas contact for W8WVP.

W0ZJB, Wichita, Kan., suggests the possibility of an out-of-this-world 2-meter net that could be put into service

by using high TV towers during the station's off-the-air hours. TV transmitting arrays are broadband affairs. They are several hundred feet higher than any ham is likely to get his antenna, and they're fed with low-loss lines. They may not have the best match in the world for 144 Mc., but even with a high s.w.r. (who's worrying, at amateur power levels?) they still do quite a job on 2. W5DFU and W5VKH have used a 600-foot tower for Channel 8 at Muskogee, Okla., on several occasions. W5IOW has worked Mississippi, Oklahoma, Texas and Kansas with fine signs on the Channel 10 array at Ada, Okla. Vince now plans to use the Channel 10 array of KAKE, Wichita, the night of Sept. 10th, and the following morning. He will be on 144.32, and would like to have as many fellows as possible keep a sharp lookout for W0ZJB/0 at that time.

This should be something for some of the members of the "Flashlight Net" reported by W3KCA, Greenmount, Md. These are hams who work at radio and TV stations, and consequently cannot be on the air during the popular evening hours. W3s HFG OWV QFM OLR YPL BJG SST KCA and YQO cannot be on the air before 0100. They hold forth each morning until 0300 or later, and invite others to join in. They use 145.62 Mc. for a net frequency, but look for other callers regularly.

VE3DIR, Toronto, is another all-nighter. Tony gets home late and has a tough time making contacts on 144 Mc. He calls CQ to the west at 0100, but usually finds it a lonely proposition.

A midnight watch is kept each Saturday on 50 Mc. by the Royal Order of Hootows, of Seattle, Wash. W7YJE has a certificate available to any 6-meter operator who will join their hooting on 6 for one hour beginning any Saturday at midnight. Net frequency is 50.4 Mc., and charter members are W7s YJE TMU VIC UFE and VMH.

South Carolina has been beyond the horizon for 2-meter men of the Eastern Seaboard, so it looked like a good place to spend a vacation to W2FBR and W2FBZ. Accordingly, they set out for two weeks at Myrtle Beach, S. C., in June. Using a 6146 rig and a 24-element portable array, Ralph and Lee operated on 2 from June 20th to July 1st, providing first South Carolina contacts for W4s in North Carolina and Virginia. No South Carolina stations were heard, though contacts were made regularly with W4CVQ, Raleigh, K4AMX, Winston-Salem, W4MDA, Wilmington, W4NTQ and W4SMA, Whiteville, and other North Carolina stations. On June 30th they worked W4s IKZ OLK VVE ZBU and SCJ in the area around Norfolk, Va., about 280 miles to the north. Skeds were kept each morning with W1HDQ and others, but there was no real band opening to the north during their stay, so no DX was worked. Just a few nights previous to the arrival of W2FBR/4, the North Carolina stations had a field day with W1s and 2s on 144 Mc!

A new mountainous path broken down on 144 Mc. W7UVH, Olympia, Wash., writes that he and W7PVZ, and W7LHL, Seattle, now work W7HEA, Toppenish, Wash. This is only about 130 miles in each case, but the Cascade Range intervenes. Big antennas (horizontal) and improved receivers seem to be major factors in breaking down this circuit. We showed W7LHL's 96-element array last month. W7UVH has a 24-element job composed of six 4-element Yagis.

VE7FJ, New Westminster, B. C., works into the Portland area, 260 miles to the south, when conditions are good. Using horizontal polarization he has connected with W7s SEZ, NNR and OKV. Art would like to see a "v.h.f. circuit of the month" in each issue of QST. So would your conductor. We'll be glad to run information on any novel ideas you fellows care to send in, as we have in the past. We need more material to make it a regular thing, however.

Anyone for Bermuda on 144 Mc.? VP9BM is all set and will keep schedules. He is on 144.35 Mc. VP9AY, who was making contacts on 50 Mc., has left Bermuda and is now on duty at Selfridge Field, near Detroit. VP9BM will keep skeds on 20, for checks on 2. Address: M/Sgt. J. W. Wen-glare, 1934 AACs Sqdn., APO 856, New York, N. Y.

## September V.H.F. Party Coming Up

Elsewhere you'll find the announcement of the regular fall v.h.f. contest. Note two minor changes in the rules for this and subsequent contests. Because of the difficulty in establishing the exact location, and the ease with which they move from one section to another, contacts with aircraft stations are ruled out henceforth for section credits. All

moving stations have been excluded from competition by the rules for some years, though many provide contacts for participants, and we hope that they'll continue to do so. But if you work an aircraft over a section you don't catch with a ground station, you can't count the section hereafter. Makes it fairer for everyone, we feel.

Another change has been made, to bring v.h.f. contest rules into conformity with the Field Day rules, and to prevent excessive numbers of contacts with a single piece of equipment. A rig used to make one or more contacts in the contest can be used thereafter under only one additional call. You work from home with a Communicator, say. Then you can go out and work from a portable location with the same rig. That's legal and logical so far. But your wife (or girl friend or anyone else who is licensed) cannot then take the rig and make more contacts under another call. This is designed to prevent "manufactured" contacts, and to make the contest results a more accurate indication of the extent of v.h.f. activity in any area.

And here's some advance information on events scheduled (Continued on page 122)

# How's DX?

CONDUCTED BY ROD NEWKIRK,\* W9BRD

## However:

Amateurs who joined the countries race within the past four years find themselves at a certain disadvantage with respect to their OT competitors in DX ranks. The U.S.S.R. portions of their ARRL DXCC Countries List check-off sheets are bare as Mama Hubbard's celebrated cupboard. It's indeed difficult for the new school to visualize how plentiful and workable those U signals were during years immediately following World War II.

Anyway, around 1951 they stopped coming back. At the same time receipt of QSLs from Russian stations dwindled to zero. That is the situation generally maintaining today. Stations bearing U.S.S.R. amateur prefixes, while quite frequently heard, work only each other and satellite-country stations<sup>1</sup>—except in curious and isolated instances. An increase in these rare exceptions to the rule is what prompts Jeeves to bring things up to date by recording here the status of 1955 DXing with respect to the Iron Curtain.

Beginning last year UB5s in the Odessa area began QSOing and QSLing on a modest world-wide basis. Other U stations now give scattered comebacks but deliver no QSLs. This may establish a trend but the pattern still is too vague to be much of a pattern. A spot-check of the "How's" mailbag turns up the following Russian call signs logged in North America on 20- and 40-meter c.w. during the past several weeks:

UA1s CF DH KAE KAI KAQ KFA KIA KJA RF TT, UA3s AF CR DH EG FE KAF KBD KET KMB KWA MP TV, UA4s HI KCE KKC KPA KV, UA6s KAB KOB, UA9s CM DH KOG KQB, UA9s KAD KCA KCI KKB KOA KOH SJ, UB5s BP CF CI CR KAA KAB KAC KAD KAG KHE, UC2s KAB KAC KBC, UD6s KAB KAD, UF6KAF, UG6AL, UI8KBA, UJ8KAA, UM8KAA, UN1KAA, UO5s AA KAA, UP2s AA KBC, UQ2s AN KAA, UR2KAA.

Some have swapped reports with stations outside the Curtain. A few have produced QSLs. These U stations, almost invariably multi-operator manned, usually are heard working each other in periodic organized activities. Their ripply signals are generated by gear which apparently is on a par with U. S. ham equipment of the 1930s. Their operating technique, however, is

\* Please mail all reports of DX activity to DX Editor Newkirk at 4128 North Tripp Ave., Chicago 41, Illinois.

<sup>1</sup> Satellite-country stations bearing amateur prefixes—DM HA LZ OK SP YO, etc.—continue limited world-wide activity, QSOing both sides of the Curtain. In Albania and Red China ham radio in any form appears to be nil. See "Whence" for info on the licensing structure in a typical satellite country.

capable; fast break-in and 30-w.p.m. code speeds are common.

Beyond the preceding evidences Churchill's descriptive "riddle wrapped in a mystery inside an enigma" easily still includes Russian amateur radio. That chink we now perceive in the radio Curtain is neither extensive nor is it necessarily permanent.

— — —

The DX contest season is upon us! Brazil's annual LABRE affair comes off early this month (see p. 126, August QST) and DARC of Germany throws its WAE Test (see "Whence") shortly thereafter. In October the VK/ZL show will take the stage. *Battle stations!* . . .

## What:

A general call to quarters, too, for our yearly African DX hunting season. "Ye'll take the long path and I'll take the short path and the W6s will be in Kenya before us," as the GMs oft lament to each other. Anyway, our DX bands will see the Dark Continent boiling through with excellent openings—even 10 meters is slated to join the party now and then.

**20** c.w. bears the brunt of late summer activity, as usual. W9UKG bagged EA9AP (14,013 kc.) 23 GMT, FF8AC (22) 21 FY7YF (61) 1, GC3KAV (78) 0, GD3UB (12) 0, HA5BL (41) 22, KJ6BG (97) 6, OA4J (27) 3, OX3AY (12) 4, SP5AR (68) 4, VO3FN (82) 22, ZP5AY (65) 1, 9S4s AR (36) 21 and AX (7) 22. Doug still is after F9YP/FC (18) 21, OD5AF (74), SU1IC 0, a YJ1 and ZD9AA (58) 21. In the joker department W9UKG nominates PX1 FUS FC7 HZ2 and CU2 psychos. — — — W6QPM climbed to 144 by way of FM7WF (45) 23, IS1AIHK (10), Turks' VP5DC (75), XZ2AD (60),

YJ1DL (5-10) 7, YS1O (50), ZD6BX (55) 12-13 and 3V8AB (55) 12-13. W10JR captured FASRJ (82) 6, IS1CXF (70) 3, LZs 1KSP (78) 1-2, 2KSK (50) 9, OK1XM (30) 10, UQ2AN (25) 8, VQ6LQ (85) 9-10, W6OXS/VP2, ZD3A (70) 3 and ZP5GM (25) 1. Vic and others wonder what gives with this ZP6CR, RCP (Uruguay) says there ain't no such animal and yet he's been at it for years. K2GMO climbs aboard our Bandwagon with CR4AL (15) 20, FF8AJ (68) 21, JAs 1ACA 1KW 2BL 3AF 3BP 5AB 6AA 6AD 6AO 6HK 8AA 8AI 8AQ, KAs 2CR 2KS 5IM, KG6NAB (81) 10, KT1EXO (92) 19, LZ1KAB (21) 2, UB5KAA (54) 13, VQ4FM (20) 4, a VQ6, a ZD3, ZP9AU, 4X4s DR (96) 22, FK (18) 22, FQ (90) 22, IE (76) 22 and others. DM2ABL 20, FQ8AC (70) 7, JAs 1KM 2AT, KA2NA 7, T2FWAF 20, VK9AU (25) 7-12 and YN1PM (5) 2 worked W7TML in good style. W5WZQ sends Texas QSLs to folk like CR9AI 13, DU1CV (80) 13, EA8BP (35) 0-3, FF8CG, FG7XB (64) 3, FK8s AE 6, AH (64) 8-15, AL 7, FM7WP (27) 23, FQ8AK (64) 6, FY7YE (60) 13, GC2ASO, a GD3, HPIEH, 11s BLF and BNU (25) 3 of Trieste, a KJ6, KR6s LJ (40) 13-14, MC OL, ST2NG 4, an SU1, VPIFL (70) 15, VP5BM of Turks (45) 18-19, a VQ6, VR2AR (9) 3-4, VSs 1FS (78) 13, 1GL (36) 14, 1GU 12-13, 6CO (50) 4, 6CT 13-14, 6CW 14, ZB1FF, ZC4IP (90) 17, a ZD6, and 3V8AN (15) 4. JAs and KAs are rather common stuff west of the Pecos but our down-east cousins eat 'em up. For their edification W5WZQ offers JAs 2BJ 2NX 6AR SAT 9CW and 6BR, plus others already specified. Dave is dreaming up a 3-element array to boost his 117/75 tally. CT2BO (62) 0, HK0AI (70) 0-1 of San André, KC6CG (50) 14, KG6AFT (80) 15, MP4QAL (63) 3, ST2BC (9) 23, UA4KPA (28) 22, VK9OQ (23) 13-14, VU2EJ (43) 2-3, 4X4s CK (15) 21-22, FS (64) 22-23, FW (9) 20, II (92) 22 and other goodies clutter up W0QBA's log to the tune of 132/103. A Viking Ranger was responsible. A one-hour WAC befall W4BBP, thanks to G6TT, CX1FB, VK2PA, KA5HM, ZS6AJ and W4TO in that order. Ben also snagged JA0CA, KJ6FAA, KC6 KR6 and ZD6 clients. A quick scanning of good 14-Mc. fortunes here and there, at W1AB: OY7ML, MP4JO (41) 3, VS2EI, W1WY: raised ZL2AFZ with his 25-watter, leaned down to 3.5 watts and still got through. W2TXB: ZD6EF to reach a 230/201 14-Mc.-only total. W2FZB: FR7ZA (30) 12, and notes long-path ZSs rolling through in the a.m. K2DSW: FY7 GD3 HK0 KA5 and VP5s on Turks Isles. K2GFL: LX1DZ, OY2A, VK9RM

(18) and other nifties contacted K2BZT. At the 100-worked mark, K6ENX collected DU1OR (45) 15, FF8 FO8, HB4FE (80) 15, KC6, KG1AM (30) 6, LA6U (90) 7, TF6WAK (30) 14-15, Turks VP5, VR2CZ (60) 5, VSs 1FH (50) 15, 2CU (90) 15, 2DW (40) 16, 2ES (80) 16, VS6s, ZB1JRK (60) 5-6, ZS, 3V8, 4S7s GE (50) 15-16, WP (35) 15 and one 4X4EF (110) 5. DL4ZC chatted with AP2Y 15-16, CR9, GM3AIM 19 of the Hebrides, LX1JW 17 and ZD2HAI 17. JA6AD ran off with some choice ones: CN2AE, CR6s BX CS CZ, CR19AN, EA6AU, ET2AB, FB8s BE BR, 15s LV REX, KT1UX, MP3BE, TF2WAF, T12s MAR PZ, Sarawacker VS4CT, XE1s CM MB, XW8AB (ex-DL5BS) now off the ban list, YK1AK, ZC2PJ (28) 13-14, ZD2s

Fortunately W4SET (ex-KA4MA-KA5MA), right, took a camera along when he visited the Macao hamshack of CR9AH early this year. CR9AH now works 20 c.w. and looks forward to the return of favorable 10-meter 'phone conditions.

F3BR, long an outstanding French DXer, runs 100 watts to a 5-stage 813 rig on 80 through 10 meters, 'phone and c.w. Henri's receiver is homespun and he favors vertical antennae.

(45) 13, SP2BZ (70) 4, ZD8AA, W3TYH: HK0, JA2AT (11) 21, VR7KAN (47) 22, VQ4FM (73) 20, W4GSJ: YU3CST, W5TFZ: HIRIRL 15-16, PJ2AE 1, YV1AI 17, W80TI: CT2 EA8 GD3, Trieste 11s, JA3AB, an Oman MP4, VP2GW, ZB1AY, 3V8 9S4, W9BZW: 11DCO/M1, OX3UD, W9BJW: Turks, TG9AC (he works A3 to A1), ZP5, GM3JDR: KH6s ER 1J, KG1s AA (85) 18, JB (60) 2, KL7BHK, Turks, XE2OK, ZD4BM. Milwaukee Amateur Radio Club DXers caught up with HZ1AB (57) 22, OD5DA (123) 21, OY2Z (15) 22, VSs 2CV (85) 16, 6DD (14) 13, UA0KAB (50) 5-6, 4X4DF (11) 0 and others. W6UED raised himself CN8EB (80), PJ2BA (40) on Bonaire Isle, JZ0AG (60-80) of N.N.G., F08 KJ6 VK9 VS1 VS6 and FY7 friends. Another Ranger fan, W4GUV rose to 67/43 with HA4TK 20, JA6AR 12, KC6, OK2GR 16, PJ2CF 20, TI2PZ 20, numerous VKs and a ZC4. CR6AI (58) 23, CR7MB (30) 3, FF8 FK8, HA5KKB (63) 0-1, HE1JO (10) 2 of Liechtenstein, LB8YB (39) 4 of Greenland, LZ1, OD5s LJ (62) 6, LX (62) 6, SPs 2GS (28) 23, 6WF (49) 0, VR3A (75) 6, YOs 2KAB (55) 0, 3RF (60) 6, 6AW (52) 8, 4X4GS

DCP (75) 21, WAF and ZE1JS. A 200-watter, SP-600JX and 4-element rotary do well by Hiro. HA5BL (5) 3, SP8KAF (50) 0, VQs 3EO 4RF 8AG (13) 5, YOs 2VM, 3RA, ZC4GF, ZE3JL, 4X4AU and sundry other rarities raised W2ZVS. Dixie finds VK9RM and ZL2AI seeking N. H. and Vt. to complete ARRL WAs, and learns that MP4QAJ hunts 14,080 kc. around 1700 GMT. W5HIS's B&W-5100, SX-28 and 32-ft. vertical scored with JA5 5DF 0AA, KC6AL, KA2s GE USA, KL7s AKE WAF, KV4AA (80) 20-22, VP7N, 3, VS6CQ 12 and many Europeans. West Gulf DX Club's *DX Bulletin*, abetted by the No. Calif. DX Club's *DXer*, gives the lowdown on AG5SQ (114) 14, CR7CO (60) 13, DU7SV (93) 7, EA8BB (40) 0, F18AP (82) 13 and too bad, FK8AJ (60) 5, FQ8AM (5) 4, JA7AD (60) 13, JZ0KS (75) 12, KC6s AJ (40) 7, LZ1KAA (70) 0, MIC (38) 21, SFs 1KAS 17, 3KAU (55) 23, SVs 1SP (16) 12, 0WU (80) 4 of Rhodes, UAs 1KAE (60) 14, 4HI (28) 4, 6KCI 0KI (28) 6, UC2KAB (30) 15, VK9s DB (15) 5, GB (52) 14, RH (35) 6, WJY Os 3CC (65) 13, 8AX (51) 0, 8CB (58) 3-4, VSs 1GJ (40) 14, 2ET (37) 16-17, 6BG (35) 13, VU2EJ (50) 1, Y13WW, YJ1AA, YQ3ET (40) 6, ZAIKAD (50) 3 ZBs 1GBF (77) 23, 68 (8) 0, ZC4PB (15) 4, ZM6AS (78) 4-11, ZS1PD/ZSS, 4X4II (50) 22, 5A4TK (75) 23 and 9S4BS (30) 22-23.

**20** 'phone and its panoply of adamant adherents apprise us of adequate 14-Mc. A3 activity. For example, W9WHM vocalized with DU7SV (198), KC6UZ (11) 13, KJ6s BG (240), FAA (240) 12, KW6BD (222), VS1CZ (170) 14 and VO3GM (133). HR10S, KA2SL and KM6AX returned the compliments of W5HIS to KA2JW, KC6CC (200-230) 8-11, KX6BU, VP6s 21N 16, 7NG 17 and 5A2TZ 21. ZD6EF brought W2TXB's n.f.m. 14-Mc. total to 120/117. FB8BZ, a new Madagascar candidate, (190) 13, runs 50 watts of A3 and speaks scant English. W4HA was one of his first U. S. contacts. VS2BD reports consistent 20-meter 'phone signals from the following Yanks at his Kuala Lumpur QTH: Ws 4DQI 8DAW 8FYR 9BVX 9JJS 0CPM 0CUL 0DPD 0DSO 0DYG 0EOE and 0VUE. These, of course, are in addition to the usual barrage of W5s W6s and W7s that continually rolls into Malaya. A 3-element whirler and 120 watts annexed KA KC6 KX6 KW6, KGs 1AA, 6NAA, KJ6FAA (217) 12, KR6AF, HZ1AB and TA3US to K2CJN's 116/108 total. Steve is another DXer making ready for the autumnal 16- and 10-meter rush. W1YOU's Globe King came

through with **HI6EC** (182), the previously mentioned **HZ1**, **KA2CY** (190), **KG1BO**, **OE13USA**, a Leewards **VP2**, **YU1GM** (105) and **ZP5IB** (286). In case you missed earlier **QST** cues, **KG1s** are Greenland-stationed **GIs**. **W4NYN** made it 127/122 with an **HZ1**, Iwo Jima's **KA0LJ** (165) 14, a **KG1** and **KG6NAB** (270) 12. **HC4BIH** 18, **KG1FR** 17 and a 5A2 answered **W9UKG** but **YS1MS** 7 and **ZP5CG** 20 play hard to get. Six hundred watts promptly produced **Formosa** **BV1US** (290) 12, **VS5CT** (lately **VS4CT**), **JAs** **IACG** **3BK** **3BP** **3DM** **6AD** **6CA** **8AA**, **KAs** **2AK** **2EB** **2MA** **2WA** **2SK** **2SM** **2WW** **3JN** **5WW** **7GB** **7LJ** **7SL**, **8AB** **8SD** **8WK** **9EW**, **CK6** **KM6** **KX6**, **TG9MB**, **SV0WS**, **VK9BS** (174) 14, **VS1s** **CZ** (143) 14, **GL** **GT**, **VR2AP**, **VS6s** **CG** **CL** **CW** (196) 14.

**JAIATF**, known to the old school as prewar **J2PS**, **J7CG**, **MX3H** and **AC1TF**, is back in the game and already has become one of the regulars who lead the breakthroughs to **W/K/AE/VO** areas when 7- and 14-Mc. Asian openings occur.

**VS2s** **BS** **CU** **DQ**, **DUs** **1VVS** and **7SV** for Washington Stater **W7UYZ**. **MRAC** **A3** specialists tapped 20 for **ET2XX** (182) 4, Kerguelen's **FB8XX** (80) 3, Trieste's **1IBNU** (120) 5, **VK91DB** (140) 13, **VQ5FS** (135) 20, **VS1EW** (120) 14, Sarawak's **VS4CT** (164) 14, Pitcairn's **VR6AC** (143) 3, **YO3GM** (115) 21, **ZD4BT** (139) 23, **4X4AS** (160) 23 and **9S4AD** (135) 22. **NCDXC** specifies **VK9OK** of Norfolk Isle, **VP2DL**, **VU2s** **ET** (175) 15, **LL** (186) 15, **4S7SW** (192) 15 and **CS3AC** of the Azores. **WGDXC** swings the 20-phone spotlight on **ACs** **3PT** (114-163), **58Q** (114-163), **C3WV** (190) of Formosa, **FF8AP** (135) 18, **FO8AK** (180) 4, **HC8GI** (166) 5, **IS1s** **BFJ** (131) 3, **BZ** (166) 5, **KJ6BH** (201) 2-3, **MP4s** **BBL** (128-169) 2-3, **BBV** (120-140) 2-4, **OD5DA** (126) 22, **OYs** **3CM** (155-200), **7ML** (155-200), **ST2DB**, **SV0WU** of Rhodes, **SV0WO** in Greece proper, **TF2WAG** (138) 20, **VRs** **2CW** (195) 3, **3C** (160) 3, **XZ2KN** (186) 15-16, **YIs** **2AM** (110-140), **3WW** (107) 17-22 who has 100 watts and a ground-plane, **YJ1AA** (230) and questionable, **ZS2MI** (175) 12-13 of Marion Island, **3V8s** **AN** (106) 6, **AS** (100) 2-3, **BA** (140) 4-5, **4X4s** **BO** (120) 22 and **FV** (150) 0.

**40 c.w.** struggled through its low summer ebb in creditable style. **K2DSW** squeaked through the static to East German **DM2AGO**, **HI3DL**, **HR1JZ**, **1IBNU**/Trieste, **OK1KTI**, **LUs** and **PYs**, **T12CR**, **YUs** **1BK** **3CST** **3DDE** **4BAB** **4DNO** and **4DOP**. Those Yugoslavs really hit 40 with a lead pipe! Skimming the cream, **W2s** **ESO** and **FA** mention **VQ5EL** (12) 2 and **ZD9AC** (38) 8, as well as **YOs** **2VM** (7, 10) 2 and **6AW** (20) 3. **DM2ABE**, **OKs** **1KB** **3KHM**, **KT1TW**, **YUs** **1KD** **2IS** **3ABC** **4JTT** **5CX** **5CXY** and about a dozen other European countries were raised by **W4EUH**'s 100 watts and folded dipe. This was John's initial DX foray and he states, "You'll be hearing from me again!" **K2s** **HZR** **1JN** and **JKC** have the goods on **CR7CO**, **CT3AB**, **HB1HT**, **HK1s** **DG** **TH**, **OX3AY**, **T12PZ**, **VS2CO** and other goodies. **K2DSW**'s Novice friend **KN4CXA** snapped up **WP4ACO** in midband. Here and there, **W4GUV** hooked: **PJ2AE**, **VKs** **KH0s**, **1I9ZYJ**: **VKs** in number, **W0VBS**: **VPs** **4LZ** **9BL**, several Oceanians, **DL4ZC**: a curious **PX1** and **OY7ML**.

**80 c.w.** gets a bold-faced heading this month mainly through the persistence of **W0ZOL**. Roger made the best of an atrocious atmospherics level to work **CE4AD** (10) 7, **VKs** **2QL** (18) 11, **3NR** (10) 12 and **ZL1CI** (20) 10-11. This month officially marks the beginning of the end of the static season in northern latitudes—look to those folded dipoles, zepps and ground-planes, men. And look alive! Rare 3.5-Mc. DX is just over the horizon

in most European QTHs. **DL4ZC** contacted **TF5TP** 23 and **OY7ML** 23 from APO 403. That **OY7** certainly is building himself an excellent all-band reputation.

**15 'phone** is a band to watch closely at this time. As the autumnal equinox sets in you'd better brace yourself for a logful of DXceptional entries. An example of just how good 21 Mc. is right now: **W4NQM** checks his bookkeeping and finds he has worked over 100 ARRL DXCC Countries List items on fifteen 'phone in just four months and two weeks of routine noncontest DXing. Recent additions to Sparky's list include **CN8MT**, **CS3AC**, **CT1OR**, **11BLF**/Trieste, **KT1WV**, **VQ4FO**, **Y13WW** and **ZB1GBF**. **W4WVM** uses a 2E26 final and 3-element rotary beam to roll up Trieste, **OE5HE**, **OQ5VD**, **VP2GG**, **VQ4RF** and **ZB1AJX** for a 70-country total. **W4s** **NQM** and **WVM** report European openings on eleven days out of a 26-day midsummer period. **EL12A** 20, **FM7WQ** 23, **HK2GO** 20, **PZ1RM** 21, **VP5BM** of Turks 1, **VQ4EU** 21, **ZP5s** **GM** 3 and **1B** 17 are specified by **W4GUV** of Birmingham. **W5HIS** collected **HC1s** **ER** **ES** **FK**, **T12EA**, and **VP1GG** who QRTs for **VR2** climes. **KG6ARE**, **T12BX**, **ZL1BY** and **ZP5HX** wound up in **W6ZZs** assortment. At **W8KBT** we find **CX2CN**, **OE6DK**, a Turks **VP5**, **YN4CB** and **YS1RA** on record.

**15 c.w.** is perking up. **CR7CK**, **IS1FIC** 19, **OY7ML** 20, **YK1AK** 12, **ZD6RM** 14 and **ZS6s** came back to **DL4ZC**. **W1CTW** nabbed that **ZD6**, plus **OK1LM** and **ZB1GBF** to raise his 21-Mc. code tally to 72 countries. **ZD6RM** tells Cal that Europeans consistently roll into Nyasaland on the 28-Mc. north-south path. **W4GUV** found **VQ4s** **AQ** and **RF** workable around 20 GMT. **FASRJ**, **PYs** **Gs** and **VP9BL** telegraphed with **K2DSW**. On the Novice front, **K2DSW** says **KN4CXA** has been working **DL** **HK** **LU** and **KV4** with easy grace. **KN2KHZ** did well with several **Gs** **WUs** **LU** and **KP4**. **WNHGM** made good with **DJ1VL**, **G2YK**, **GW3YR**, **1IB9MU**, **PJ2AR** and **YN1AA**. Say, no Novice yet has joined the DX Century Club—any likely candidates?

**10 'phone** holds the interest of **W1WXC**. John has **CE2HD**, **CN8s** **CS** **MM** (heard), **CXs** **2BP** **2GM** **4AB** **4CS** **5CV**, **HCs** **1KV** **4MK**, **1IR4WH**, **OA4CL**, **PJ2AP** and **YV3BD** sneaking through. Argentinians **LUs** **1CM** **1DCH** **4AAR** **4DJT** **5AE** **5DC** **7QB** **8BF** **SDEG** **9CX** **9DDA** and **9EU** also were bagged. Traces of Europe have

**V3RA** keeps on good terms with the native Fanning Island police chief at right. Ray returns to Australia soon, after making a tremendous DX hit with countries chasers throughout the world. (Photo via **W6MUR**)

been tantalizing **W1WXC** and he regularly points his 65-ft.-high 3-element twirler at the Continent and calls "CQ Europe" on 28,525 kc. around 14-15 GMT. **W1Z1W**'s 35-wattier picked off **CN8CS**, **CXs** **3AA** **5CV**, **LUs** **1CM** **1QG** **7QB** **8FB**, **VPs** **2GX** and **9AY**. Europeans have been heard. **GM3JDR** detects signs of 28-Mc. life and dropped down to 10 for a chat with **LU9EV**.

**160 c.w.** created quite a stir in July and August much to everyone's surprise. **W1BB** reports that **G3s** **ERN** **GCN** **JOJ** and **JV1** started things off by writing several **Ws** for summer schedules. Among those who said "Sure!" were **K2BWR**, **Ws** **1BB** **3RGQ** **9NH** and **9PNE**. So what do these inveterate static-hounds do but pull off some nice transatlantic contacts beginning in early July! **K2BWR** evidently turned the trick first with **G3GGN** (1828 kc.). **W3RGQ** followed suit with a **G3GGN** QSO next evening, all this two-way work occurring between 10 and 11 P.M. **EDST**. Other unidentified signals were creeping across the pond at the same time but no other two-ways were reported. Gosh, what next?

Few North American amateurs have QSO'd the Finnish department (state) of Ahvenanmaa, the Aaland Islands, in the Gulf of Bothnia. OH1s NK PI ST, standing l. to r.; OH1RX, seated; and OH1SS, who snapped this photo, gave opportunity for such OH1 contacts during the week end of May 21st-22nd. Their DXpeditionary force accomplished 214 QSOs on 14 Mc. and 60 on 3.5 Mc., all c.w. save one. Seventy U.S.A. contacts were recorded. The 200-watt transmitter belongs to OH1ST, the receiver to OH1RX. Ground-plane and long-wire antennas were used.

## Whence:

Asia — The Nicobar Islands have been inconspicuous by their ham-band absence since VU5AB shut down a couple of years ago. VS2DQ observes: "A recent VU5AB definitely is a pirate. There are VS1 amateurs who visit there regularly

and sometimes stay there a considerable time. But licenses are issued by the government of India and, alas, it seems impossible for any of the VS1 boys to get one." VS1GO affirms this in penning W1WPO: "Haven't heard any further about the VU5 deal — guess that's fallen through. I return to the U.K. in the fall, anyway." VS1GO (ex-VS9AW) has been working 160, 80 and 40 meters but hopes to get in some sessions on 20, 15 and 10 before moving Europeward. Reliable power components, he says, are extremely difficult to come by over there ..... AC4NC, on leave in Calcutta of late, is expected to be back in action at the Tibet Indian Mission before long ..... W5EVW, trying his luck as MP4BBT, verifies that MP4s QAG and QAH have left the Middle East for leave and reassignment ..... JA1FM, one of the first Japanese YLs licensed postwar, mainly enjoys transpacific work on 7-Mc. 'phone. The International DX League, Box 56, Kyoto Central P.O., Japan, now issues an ambitious DX newsletter titled QAV ..... Thailand evidently has authorized a few legitimate ham licenses but HS1 authorities still haven't bothered to remove their country from the International Telecommunications Union's taboo list (see p. 61, last month's QST). W6ZOL ran across one HS1BC on 40 c.w. and copied his QTH as Choon Sasamvai, 46 Manerok, Raja Damnven Ave., Bangkok. The fellow QRM's himself with a terrific backwave ..... W9KOK heard from ex-AC4RF shortly after the latter's release from a 6-year Red China imprisonment. Bob hopes to be back on the air with a G call soon and possibly from other rarer spots in the future. At present ex-AC4RF's time is fully occupied in writing and lecturing on his harrowing Asian experiences. .... A cheery welcome to the country of Laos (XW8) which now is back in the good graces of international amateur radio. Laos removed itself from the ITU ban list as of July 20th and FCC-licensed amateurs now are free to work XW8s. XW8s AA and AB already are available on 14 Mc. 'phone and c.w.

Oceania — ZC3AC was plagued by transformer burn-out troubles throughout the summer — winter on Christmas — but VS2DQ finds him still hopeful of a full-scale 14-Mc. onslaught before 1956 sets in. Christmas Island has no airstrip, receiving mail but once monthly by sea from Malaya or Australia. High humidity remains the curse of tropical electronics; FW8AB of Wallis also fights continual power-component failings ..... VK9OK has another year or so left on Norfolk Island, according to E. G. Riggall. Len most of all desires consistent contact with the United Kingdom but the G paths are rarely open for him on 20 ..... According to Amateur Radio of WIA, W2CPN (ex-W9RCQ) is making quite a hit during his Down Under visit. Also, shipboarders X1NE and X1NP again are hamming on 14 Mc. in Australian waters. VK3XU takes over as WIA awards manager and has been an outstanding DXer for years ..... W4GUV learns that KC6CG brought his QSLs backlog under control by dispatching a spanking batch Statesward, all via bureaus ..... We welcome the Kermadec Islands as a new member of the ARRL DXCC Countries List family. This group, annexed by New Zealand in 1887, normally is uninhabited. That means the Kermadecs will be a prime target for DXpeditionary efforts by ZLs and other itinerant DXers ..... WGDXC addenda from Pacific areas: KH6AIW plans a visit to KM6 KS6 and KX6 haunts. .... KG6SB mentions a new KG6S club station upcoming on Saipan. .... FK8AO (ex-FQ8AE) runs 75 watts to an MD2AC multiband skywire with a rhombic in the works. He's active mostly on week ends, 0200-0900 GMT, 20 meter c.w. .... W6SAC is mentioned

in connection with a possible Wallis isles DXcursion. . . . VR6AC has a diesel power outfit and a three-element beam on Stateside order. . . . KC6CG has worked over 50 WGDXC votaries and is found regularly between 14,200 and 14,220 kc. at 1200 GMT.

**Europe** — DARC (Germany) invites world-wide participation in its WAEDC contest, an interesting new affair scheduled for (c.w.) 0000 GMT Sept. 17th to 2400 on the 18th, and (phone) the same hours Sept. 24th-25th. European stations will QSO non-European stations on all bands 3.5 through 28 Mc. The serial exchange is the usual five-digit (phone) and six-digit (c.w.) numeral — RST001, RST002, etc. **SCORING** (for non-European entries): Each completed QSO counts one point and each station can be worked but once per band. *Additional points* can be earned by transmitting "QSO reports" to European stations, these designated as "QTC" at one point each. Each QTC consists of three parts — (1) time in GMT, (2) station call, and (3) QSO number, of any previous WAE Test QSO. For instance,

SVs ØWO ØWN ØWK, front, l. to r.; ISP IAB, an SWL, middle; ØWL, another SWL, ØWQ and ØWT, rear, make up the majority of the Athens, Greece, ham gang. Other Athenians not available for this picture: SVØs WI WN WP WR and WU, the latter active on Rhodes almost daily, 0500-0730 GMT, using 14 Mc. (Photo via STØWO)

W5XXX raises DL7AA and thereby garners a QSO point; W5XXX previously worked G6ZO at 1207 for G6ZO's 113th Test QSO. So, in addition to the QSO point for his DL7AA contact, W5XXX gains another point if he sends "1207/G6ZO/113" to DL7AA. As many as ten QTCs can be sent per QSO but each QTC can be sent but once. Ergo, the more QSOs you rack up, the more QTCs you have available to parlay into additional points. *More additional points*, termed bonus points, are gained by working a station on three different bands (2 points), four bands (3 points) and five bands (4 points). *Multipliers* are derived from a modified version of DARC's WAE Award countries list, as follows. CT1 CT2 DL-DJ EA EA6 EI F FC G GC GD GI GM GW HA HB HE HV I IS IT NI LA LX LZ OE OH OK ON OY OZ PX SM SP SV TA TF YO YU ZA ZB1 ZB2 3A2 984 plus Trieste (IT), Jan Mayen (LB), Spitzbergen (LB), Rhodes (SV), Crete (SV), Aaland Islands (OHØ), Shetlands (GM), Orkneys-Hebrides (GM), arctic Norway (LA), arctic Finland (OH9), arctic Sweden (SM2), Bornholm Island (OZ), West Berlin (DL7), German East Zone (DM) and Gotland (SM1). *For final score*, multiply combined QSO points, QTC points and bonus points accumulated on all bands by the combined numbers of multi-

pliers collected on each band. Certificate awards will be available for highest scorer per country and presumably per U. S. and Canadian call area, in separate single-op and multiop categories. Such winners will be deduced from logs submitted to DARC's DX Bureau, Fuchsienweg 51, Berlin-Rudow, Germany, postmarked before November 20, 1955. See you on the north Atlantic paths, DROMS! . . . . .

Two unsolicited bouquets from the Continent for often-maligned WDX chasers, SM5ARP, reference his recent summer idyl in Monaco: "Had much trouble with the 3A2AW rig this time, lots of troubleshooting. W manners were excellent and permitted speedy operation." And from HB9HT of Swiss FD set-up HB1HT: "I would like to express our thanks to all the many W stations who, with their snappy operating, were a great deal responsible for . . . our high score." . . . . . IRTS (Eire) had a field day, too — everybody's doing it — and declares that "this year's National Field Day will go down on record as one of the wettest ever experienced." [No, Boss, they mean rain. . . . . *Jeeves*]. . . . . IIs BRN and DCO gave the gang some good shots at San Marino in early July. K2BZT got in on the spoils early, noting that most of the W crowd was caught napping on this quickie. Hayden is among the many W/K brethren on the watch for an HB1 or HB9 in Valais canton, a real rarity for Illelveta-22 sheepskins. . . . . GM3JDR, with 111 countries to his 150-watter's credit, states that his is the most northern ham station in Scotland. Furthermore, he and GM3BZJ are the only amateurs in County Caithness. GM3JDR still needs Miss, Nev., N. Mex., S. Dak. and Utah for WAS and guarantees 100 per cent QSL . . . . .

Supplementing this month's introductory remarks, W9UKG passes along info on the Hungarian ham set-up. There are about 60 HA licensees active, about half of which operate collective (multiop) layouts. The remainder stick to v.h.f. bands. License classifications go like this: *Ultrahigh*, 10 watts input from 144 to 10,500 Mc.; *Class A*, 10 watts on 3500-3850 kc., c.w. only, for one year; *Class B*, 50 watts on "all bands" with all permitted emissions; and *Class C*, 200 watts, same as Class B otherwise. HA5KBA, the Hungarian "headquarters station," appears to be in a class by itself with a flock of operators, 750 watts input and much American-made equipment. . . . . DM2ABK informs W9UKG that three East German prefixes now are in use: DM2 for "private" amateur stations, DM3K for collective stations, with DMØK calls representing individual operators of collective stations.

**Hereabouts** — "The W9-DXCC annual meeting will be held at the Sheraton Hotel, Chicago, Saturday, September 17th, from 2:00 p.m. on, with a dinner being served at 6:00 p.m. The meeting is open to any and all holders of DXCC certificates. Interested parties should write W9s FID FKC NN or QIY for details." This from W9FID. Get in touch with the boys immediately concerning this on-clave because guys are still raving about the last one. . . . .

W7CSW is doing some slant-7 operating in Idaho this summer. Overseas 14-Mc. WAS aspirants take note . . . . .

VP1EK, one of the newer British Honduras actives on 14 and 21 Mc., is a good bet for a fast VP1 pasteboard . . . . . FFER/K2JC's hears that VP2GG is making plans for heavy Windward Islands activity on 21 Mc. after a few years on 40 meters. Friend VP2DL normally sticks to 20 . . . . .

W2TXB chased ZD6BX all over the place for two months and then clicked abruptly with ZD6EF. Naturally, with the pressure off, ZD6BX came back shortly afterward. Al is a charter member of the "Never Give Up!" QSL club, too. ZK1AH's confirmation came through after six years: PK6VK, four years; CR5UP and VK9FM, three years apiece. . . . .

WPW and Dutch St. Marten licenses are difficult, if not at present impossible, to obtain. . . . . KH6AR personally visited W6ZZ after a series of 100 QSOs beginning in 1936 when they were K6MIV and W1WV, respectively. Veterans of old 10-meter days will recall that K6MIV's Hawaiian phone was among the first to bombard the East Coast in the mid-1930s. W6ZZ's new RSGB Empire DX Award, incidentally, is signed by the mayor of Southgate, England (G6CLJ).

Periodically a feature in DX doings is the sudden appearance of HB1 portables on DX bands during the Swiss National Field Day sponsored by USKA. Here is the 1955 affair's top-scoring layout, HB1HT, with (standing, l. to r.) C3EIO, HB9s LD EL, an SWL, HB9HS; (seated) HB9s HT LO and PW in attendance. This group, representing the Zurich Ham Gang in the activity, used a 50-watt gang-tuned bandswitching rig and a 70-foot-high 80-meter zepp with main lobes on Great Britain and U.S.A. Swiss, British, Belgian and German amateurs usually arrange coinciding FD dates to boom participation into one of Europe's outstanding annual ham events.

PHIL SIMMONS, WIZDP, Communications Asst.

GEORGE HART, WINJM, Natl. Emerg. Coördinator  
ELLEN WHITE, WIYYM, Asst. Comm. Mgr., 'Phone  
LILLIAN M. SALTER, WIZJE, Administrative Aide

**New Season Ahead.** September marks the beginning of another operating season! The old sunspot cycle has definitely turned the corner, is over a year on its way, and such bands as 10 and 15 meters will be open for longer periods with more DX offered up for those alert to work it. Net activity and traffic will continue to be well supported as the nets "up" their number of sessions and the amateurs returning from vacation get back in the swim. The v.h.f. activities this September (and at other periods in the season schedule) should be the best ever; there were new highs in accomplishments and participation in the '54-'55 season. Don't overlook the chance to get into the FMT (Frequency Measuring Test) on the evening of September 15th . . . see announcement elsewhere in these columns.

Individual report of FMT results is sent you, if you report, and with an information copy to the appropriate SCM. This is so that if you do well enough this can document your application to the SCM for an Observer post in the frequency measuring classes. But more amateurs are needed in OO operations to send "coöperative mail notices" to fellow amateurs to help them avoid FCC citations, also "for better operating." Whether or not appointed in a frequency measuring classification you can get lined up for c.w. or 'phone observing posts aside from frequency measuring.

For RMs, PAMs and NCSs who have not already done so, this is a reminder that it is time to reregister the frequency and operating periods of all nets to get them included in the annual Net Directory.

**On the Correct Handling of Messages.** During the vacation season, the undersigned was shocked to get the radio suggestion from one member of a 'phone net to whom a message was being *relayed* that he would change the text; he thought it more clear if the text were worded a different way! Let it be clear to everyone, once and for all, that it is a standing communications principle in all communications systems worthy of the name that *the text of the message cannot be changed except by the originator*. To do so would result in distortions of meanings, and lack of confidence in any such undependable service that turned out messages with modified texts. Besides watching such things that by observance spell out sound communication practices, every new and old traffic handler is urged to require "place" and "date" given with the other vital information preambles should include. The check is helpful and important.

Our young friend who volunteered to add a word to the text had apparently no thought that this would not be compatible with the group count that the message already carried!

It should in fairness be said that the over-all picture of vacation message service was impressively good and coöperation high in all directions. Many functioning nets were observed.

**FD Post-Mortems.** W8ENS (Springfield, Ohio, Amateur Radio Club) compares the exigencies of the Field Day to those of civil defense or emergency operations. He says planning should involve tents painted with a broad stripe to identify them, stakes the same color (80-meter tent with red poles and stakes, for example). A 100-foot rope to attach to the power unit to prescribe the exact distance to set up the different tents would have helped. W8ENS notes the contrast between loud *emergency* talkers and joiners and the "amazing few that show up when the real shake is on." As he puts it, where would we stand if members of an emergency group had never put up a wire in rain, sleet or ice or didn't own a pair of boots or raincoat, nor had a gallon of gasoline stashed away for use in emergency? One objective of Field Day is to learn these things. (We gather there *was* rain in Ohio and some missing items for coping with these offenders speedily and with highest efficiency!)

W7RGL in the wee Sunday morning hours of FD heard many calls sent poorly and too fast. He reduced *his* 17-w.p.m. speed to set a striking example of change in technique and reports the results worthy of duplication. He says, "Changing to 8 w.p.m. I called CQ FD. The result was immediate, four slow but clean replies. In the next hour sticking to 8 w.p.m. I *doubled* the number of contacts per hour."

The Joliet Amateur Radio Society in "Ground-Waves" reviews its performance and for the record lists six points it will take up for next year. Other groups may have a different list but some points are sure to be generally applicable: (a) have not less than four operators for each position; (b) each operator to be given a chance to practice with transmitter and receiver before FD to minimize fumbling-time; (c) plan beams; (d) use speech compression; (e) arrange *training* Novices to improve logging and assist checking, several advance one-hour sessions.

All early reports indicate that *several groups* topped last year's showing. It's amazing to us that eyes are so soon focused on '56 plans. *QST* will have more on preliminary results for this year soon.

## A.R.R.L. ACTIVITIES CALENDAR

Sept. 3rd: CP Qualifying Run — W6OWP  
 Sept. 14th: CP Qualifying Run — W1AW  
 Sept. 15th: Frequency Measuring Test  
 Sept. 17th-18th: V.H.F. QSO Party  
 Oct. 7th: CP Qualifying Run — W6OWP  
 Oct. 8th-9th: Simulated Emergency Test  
 Oct. 13th: CP Qualifying Run — W1AW  
 Oct. 15th-16th: CD QSO Party (c.w.)  
 Oct. 22nd-23rd: CD QSO Party (phone)  
 Nov. 5th: CP Qualifying Run — W6OWP  
 Nov. 12th-13th, 19th-20th: Sweepstakes  
 Nov. 18th: CP Qualifying Run — W1AW  
 Dec. 2nd: CP Qualifying Run — W6OWP  
 Dec. 12th: CP Qualifying Run — W1AW

**For Enjoyable Operating.** The quarterly (summer) CD Party in July was the day-off or "chance to live it up" for the whole family of ARRL appointees. Sometimes the newer amateurs write in to ask about these things and we are only too glad to tell all readers about the set-up.

The operating highlights for appointees known as CD Parties are scheduled four times a year, usually in the later weeks of January, April, July and October. Such radio get-togethers promote fraternalism. One meets fine operators and has QSOs "all over" wherever the equipment used is flexible enough to permit changing easily from band to band. There can be long chats or fast contacts and an unparalleled opportunity to test station range and consistency.

To be an ARRL appointee one has to agree to send consistent activity reports monthly to his SCM (address page 6, *QST*). The activity in a selected SCM-appointment status that assists fellow amateurs earns the right to participate in the quarterly radio activities as they come along. The idea is that appointees do more for each other and fellow amateurs than in casual work, each appointment being dedicated to particular aims. Send a radiogram or a postal card for a copy of "Operating an Amateur Radio Station" for detailed information on each appointment post. If you are more than a casual amateur and have some time to dedicate to definite objectives, get your SCM to accept your application for appropriate station or leadership appointments along the lines of your natural interest.

— F. E. H.

## BRIEF

The "Worked All VE" award is now being issued by the Nortown Amateur Radio Club on behalf of the Canadian Amateur Radio Operators' Association. All amateurs are invited to try for WAVE. Here are the rules:

(1) Obtain two cards for QSOs with amateurs in each of these Provinces: Prince Edward Island, Nova Scotia, New Brunswick, Quebec, Ontario, Manitoba, Saskatchewan, Alberta and British Columbia.

(2) Each of the two cards must be from a *different station* and for work on a *different band*, for a total of 18 cards.

(3) Yukon and N.W.T. cards may be submitted in place of VE7 cards.

(4) All contacts must have been made after January 1, 1959.

(5) Mail confirmations, with 50 cents to finance their return, to Nortown Amateur Radio Club, P.O. Box 356, Adelaide Street Postal Station, Toronto, Ontario, Canada.

## DXCC NOTES

Announcement is hereby made of one addition to the ARRL Postwar Countries List. The addition will be the Kermadec Islands. These islands are located approximately 600 miles NNE of North Cape, New Zealand, and are administered by New Zealand.

DXCC credit will be given starting November 1, 1955, for creditable confirmations dated on or after November 15, 1945. This will permit foreign amateurs to start receiving credits at the same time as those in U. S. A. Confirmations received prior to November 1, 1955, for this country will be returned without credit.

In future ARRL DX Competitions, those making contact with amateur stations located in the Kermadec Islands may claim credit for a separate country in accordance with DXCC rules.

## FREQUENCY MEASURING TEST, SEPTEMBER 15TH

All amateurs are invited to try their hand at frequency measuring. W1AW will transmit signals for the purpose of frequency measurement starting at 9:30 P.M. EDST (6:30 P.M. PDST), Thursday, September 15th. The signals will consist of dashes interspersed with station identification. These will follow a general message sent to help listeners to locate the signals before the measurement transmission starts. The approximate frequencies used will be 3622, 7034 and 14,078 kc. About 4½ minutes will be allowed for measuring each frequency, with long dashes for measurement starting about 9:36 P.M. It is suggested that frequencies be measured in the order listed. Transmissions will be found within 5 or 10 kc. of the suggested frequencies.

At 12:30 A.M. EDST, September 16th (9:30 P.M. PDST, September 15th), W1AW will transmit a second series of signals for the Frequency Measuring Test. Approximate frequencies used will be 3675, 7046 and 14,125 kc.

Individual reports on results will be sent to all amateurs who take part and submit entries. When the average accuracy reported shows error of less than 71.43 parts per million, or falls between 71.43 and 357.15 parts per million, participants will become eligible for appointment by SCMs as Class I or Class II OOs respectively.

This ARRL Frequency Measuring Test will be used to aid qualification of ARRL members as Class I and Class II observers. Present observers not demonstrating the requisite average accuracy will be reclassified appropriately until they demonstrate the above-stated minimum required accuracy. Class I and Class II OOs must participate in at least two FMTs each year to hold appointments. SCMs (see listing, page 6) invite applications for Class III and IV observer posts, good receiving equipment being the main requirement. All observers must make use of the cooperative notices (mail forms provided by ARRL) reporting activity monthly through SCMs, to warrant continued holding of appointment.

Any amateur may submit measurements on one or all frequencies listed above. No entry consisting of a single measurement will be eligible for QST listing of top results; at least two readings should be submitted to warrant QST mention. Listing will be based on over-all average accuracy, as compared with readings made by a professional frequency-measuring lab.

### NATIONAL CALLING AND EMERGENCY FREQUENCIES (kc.)

C.W.	'PHONE
3550 14,050	3875 14,225
7100 21,050	7250 21,040
28,100	29,640

During periods of communications emergency these channels will be monitored for emergency traffic. At other times, these frequencies can be used as general calling frequencies to expedite general traffic movement between amateur stations. Emergency traffic has precedence. After contact has been made the frequency should be vacated immediately to accommodate other callers.

The following are the National Calling and Emergency Frequencies for Canada: c.w. — 3535, 7050, 14,060; 'phone — 3765, 14,160, 28,250 kc.

### CODE PROFICIENCY PROGRAM

Twice each month special transmissions are made to enable you to qualify for the ARRL Code Proficiency Certificate. The next qualifying run from W1AW will be made on September 14th at 2130 EDST. Identical texts will be sent simultaneously by automatic transmitters on 1885, 3555, 7125, 14,100, 21,010, 52,000 and 145,600 kc. The next qualifying run from W6WOP only will be transmitted on September 3rd at 2100 PDST on 3590 and 7138 kc.

Any person may apply; neither ARRL membership nor an amateur license is required. Send copies of all qualifying runs to ARRL for grading, stating the call of the station you copied. If you qualify at one of the six speeds transmitted, 10 through 35 w.p.m., you will receive a certificate. If your initial qualification is for a speed below 35 w.p.m., you may try later for endorsement stickers.

Code-practice transmissions will be made from W1AW each evening at 2130 EDST. Speeds are 15, 20, 25, 30 and 35 w.p.m. on Monday, Wednesday and Friday, and 5, 7½, 10 and 13 w.p.m. on Sunday, Tuesday, Thursday and Saturday. Approximately 10 minutes' practice is given at each speed. References to texts used on several of the transmissions are given below. These make it possible to check your copy.

Date	Subject of Practice Text from July QST
Sept. 1st:	A Four-Band S.S.B. VFO, p. 11
Sept. 7th:	Versatilize Your Oscilloscope, p. 13
Sept. 9th:	Band-Scanning — The Easy Way, p. 18
Sept. 12th:	A Tripler for the 1215-Mc. Band, p. 20
Sept. 20th:	Subinterval Markers . . . , p. 22
Sept. 22nd:	Selenium Break-In Keying, p. 28
Sept. 26th:	Hints & Snarls — GVZ Style, p. 45
Sept. 28th:	With the AREC, p. 70

### W1AW OPERATING SCHEDULE

All times given are Eastern Daylight Saving Time)  
*Operating-Visting Hours:*

Monday through Friday: 1300-0100 (following day).

Saturday: 1900-0230 (Sunday).

Sunday: 1500-2230.

*Note:* W1AW will be closed from 2230 Sept. 4th to 1300 Sept. 6th in observance of Labor Day.

A mimeographed local map showing how to get from main highways (or from HQ. office) to W1AW will be sent to amateurs advising their intention to visit the station.

*Official ARRL Bulletin Schedule:* Bulletins containing latest information on matters of general amateur interest are transmitted on regular schedules.

*Frequencies:*

C.w.: 1885, 3555, 7125, 14,100, 21,010, 52,000, 145,600 kc.

'Phone: 1885, 3945, 7255, 14,280, 21,350 kc.; 52 and 145.6 Mc.

*Times:*

Sunday through Friday, 2000 by c.w., 2100 by 'phone.

Monday through Saturday, 2330 by 'phone, 2400 by c.w.

*General Operation:* Use the chart on page 70, May QST, for determining times and frequencies for W1AW general contact with any amateur. Note that since the schedule is organized in EDST, the operation between 0000 and 0100 each day will fall in the evening of the previous day in western time zones. See also the note on page 65, August QST.

*Code-Proficiency Program:* Practice transmissions at 15, 20, 25, 30 and 35 w.p.m. on Monday, Wednesday and Friday, and at 5, 7½, 10 and 13 w.p.m. on Sunday, Tuesday, Thursday and Saturday are made on the above-listed frequencies. Code practice starts at 2130 each day. Approximately 10 minutes' practice is given at each speed. On Sept. 14th, Sept. 15th and Oct. 13th instead of the regular code practice, W1AW will transmit certificate qualifying runs and a frequency measuring test.

### TRAINING-AID NOTES

Affiliated clubs will want to note the addition of two films to the League's visual aids library. The General Electric Company has placed two films on deposit for use by affiliated-club groups, whose secretaries are invited to write in to the ARRL Communications Department for booking information.

1) "And a Voice Shall Be Heard," 22 minutes, black and white sound. The importance of communications in coordinating the relief activities of a disaster-stricken city is demonstrated with emphasis on the part played by the radio amateur.

2) "Principles of Electricity," 20 minutes, color sound. This animated film gives individual treatment to the volt, ampere, ohm, etc. The latter portion explains the essence of magnetism and magnetic fields.

— — —

Note too the new addition of a slide collection, produced by the Rochester Antique Wireless Association, the object of wide acclaim throughout the country. Titled "The First Thirty Years of Amateur Radio," the slides and accompanying tape-recorded lecture are sure to please old and new club members alike. Affiliated club officers are urged to follow standard booking procedure, allowing ample notice and choice of dates. Address all correspondence to the League's Communications Department.

The dates for this year's Simulated Emergency Test have been set as October 8th-9th (see Activities Calendar, June and subsequent issues of *QST*). Now don't say you weren't given advance notice. The customary bulletin will be in the hands of ECs by the end of this month.

We've been doing some thinking about the SET. Wish you would, too. In past years, we have been most liberal with dates on each side of the designated week end, and this has resulted in ability of ECs to combine SET with local civil defense or Red Cross activities, or pick a date or week end more convenient for AREC registrants. It has had the disadvantage of detracting from the nation-wide demonstration aspect of our SET, about which we are usually called by newspapers and press associations.

The SET is the ARRL's and the amateur's own exercise. It has been conducted every year since 1947, in conjunction with whatever agencies the AREC is serving. Naturally, since the Red Cross is and always has been one of the primary agencies to be served, it played a key part in the exercise, to the extent that many amateurs got the impression that the SET was a Red Cross test. In these cold-war days, civil defense has become more important, and inevitably c.d. has played a bigger part each year in the SET. Such participation has not necessarily been at the expense of Red Cross participation, although in some places where the emphasis has shifted, this has been the net effect.

We would like to request that ECs, if at all possible, this year plan their SET for the designated week end. We expect to continue the liberal policy regarding dates, and any participation within a week or more of the October 8th-9th week end will be considered eligible for inclusion in the SET data. But it makes a better national impression if we all conduct our tests at the same time, or at least on the same week end, particularly since many stations operate on the National Calling and Emergency Frequencies during that week end for the specific purpose of assisting in the handling of traffic.

Only a few stations copied the Test Emergency Alert last year. It was sent only once, by W1AW. This year, we hope to have W1AW repeat it several times, and perhaps have stations in the Midwest and Far West send it at unspecified times also. In any event, we'll have TEA in this year's SET. Watch for the details in the announcement, October *QST*.

W6PKI reports that on May 7th the only medical man on Falalop Island, a pharmacist's mate, was seriously injured when struck by a military vehicle, and aid was summoned by amateur radio. Ed Pitta, operator of KC6CG, made contact with KA3MD in Japan who immediately got advice from military doctors which enabled him, with the aid of a native girl nurse, to do the things necessary to save the victim's life. KA3MD then contacted KG6AA, operated by Capt. Comstock on Guam, who instigated an emergency air flight to Falalop to evacuate the injured man. Military doctors credit Ed Pitta, KC6CG, with saving the man's life by his prompt action in getting medical advice.

The AREC 10 Meter Net of Nassau County, L. I., held their first hidden-transmitter hunt on January 6th. W2KCW/m was the hidden transmitter at a spot where Hewlett Bay almost surrounded him. Four fixed stations,

with the help of beams and W2ZJB with a loop, made a fix, plotted it on a map and directed the twelve mobiles to the location. Within the "fix" area of one square mile the gang had to drive up and down the various canal roads until the correct one was found. K2AMN's mobile loop proved so good that most of the mobiles are planning to install one.

— W2ZAI, SEC N. Y. C.-L. I.

An emergency drill called the "Hia-Springs" drill was conducted by the Dade County AREC starting at 1400 EST on Feb. 27th. EC W4IYT alerted the AREC and Dade Emergency Net. Emergency net control stations were set up at the Hialeah Fire Department and at City Hall in Miami Springs. Mobile roll call began at 1405, and twelve mobiles responded, nine of which were dispatched to "bombed" bridges, others kept on stand-by. Each mobile, upon arriving at destination, dispatched a damage report in standard ARRL form, after which they were redispached to specified councilmen in Miami Springs, many of whom rode along in mobiles during much of the drill. After disaster traffic had been cleared, W4NVU took net control to contact all fixed stations wishing to take part throughout the country, and five additional stations did so.

A recording was made of the whole operation, to be played back later and checked for mistakes in procedure. Publicity was given by both the *Miami Herald* and the *Miami Daily News*. The drill was secured at 1600 EST.

— W4IYT, EC Dade Co., Fla.

The Tennessee SEC, W4RRV, conducted a sectionwide surprise drill on April 21st, to determine how quickly the state-wide AREC could mobilize if necessary. The drill was opened at 1800 EST and terminated at 1924. W4RRV says that cooperation was wonderful, and that when the boys called in, they stood by. The drill was conducted on 3980 and

## NATIONAL RTTY CALLING AND WORKING FREQUENCIES

3620 kc.      7140 kc.

3635 kc., and some local activities were reported on both ten and two meters. A total of 65 stations checked in on 3980 kc., six on 3635 and fourteen out-of-state, including stations from Virginia, Alabama, Mississippi, Kentucky and Georgia. Alabama SEC W4TKL said he would have activated his extensive Alabama AREC establishment if it had been a real emergency. SCM W4SCF and PAM W4PFP were both active.

Local nets were also activated throughout the state. In Nashville, EC W4OEZ alerted his AREC gang after getting word of the surprise drill at 1820 CST. Ten stations reported into the two-meter net, which was turned loose at 1910. On ten meters, sixteen stations reported between 1842 and 1855. All this was completely without any advance notice that a drill was to be held.

We think the Tennessee boys deserve a big hand for this spontaneous demonstration of their readiness.

The Communications Section of the Third Mobile Support Group, supported by members of the New Albany (Ind.) Mike and Key Club, gave a communications demonstration to the chiefs of the 20 volunteer fire departments of Jefferson County, Ky., on Monday, May 16th. The exercise

Some local brass inspect the new emergency generator donated to Kerr County, Texas, and the City of Kerrville by the Kerrville Radio Club. Left to right in the picture are W5UNE, W5BEO (EC), County Judge J. R. Leavell and Kerrville Mayor Dr. J. L. Bullard.

was designed to give training to the members of the communications section and to acquaint the fire people with the capabilities and limitations, and to give them a general knowledge of communications, equipment and personnel; also to show them how properly to word messages, which were then transmitted from the president of their association to the various chiefs. Replies came through in most cases. The test was quite successful. The communications picture in Louisville is shaping up right nicely.

— W4BAZ, EC Jefferson Co., Ky.

Seventeen ECs, representing 5710 AREC members, submitted reports for May activities. This represents an increase of seven reports from last year's mark, and over 3000 AREC members represented. An encouraging sign of progress, we'd say. The following sections reported, through their SECs (new sections for the year in italics): Ontario, Western N. Y., Western Fla., *Maine*, South Dakota, Montana, Alabama, Los Angeles, *West Va.*, Minnesota, N. Y. C.-L. I., Oregon, San Joaquin Valley, Eastern Fla., *Nebraska*, Wisconsin, Washington. Twenty-six sections have reported in 1955, only six below last year's total. Midyear summary in October QST.

### RACES News

Some time ago we received a very fine article from W6JAU on the Arcadia, Calif., civil defense emergency radio set-up. W6JAU is not only EC for Arcadia, but also communications chairman for the Arcadia Red Cross Disaster Corps and radio officer for Civil Defense Area D. In Arcadia, civil defense and Red Cross work hand-in-hand with the AREC to form a closely-knit organization to provide any kind of emergency communications called for. They have

14 mobiles, two pack sets and one hand-carried unit, two gasoline-driven generators and necessary fixed station equipment to set up a net control station anywhere in a matter of minutes. Mobility and versatility of equipment are paramount in Arcadia. The fixed net control is K6AQT, located in the basement of the City Hall. Vertical polarization is used by all units to facilitate mobile work.

Arcadia, being the control center headquarters for Civil Defense Area D, has the responsibility of coordinating eleven cities in its area, some of which have similar mobile nets of their own. Those which do not are served by the Arcadia group or that of a near-by or adjacent city. The Arcadia group meets each month and conducts frequent net drills and demonstrations. All members have Red Cross and civil defense identification, including RACES clearances. The group even has a TVI Committee.

A salute to Arcadia and its well-organized establishment of amateurs serving civil defense and the Red Cross!

Recent reports from the City of Baltimore indicate a healthy increase in interest and activity among the RACES group. In addition to participation in "Operation Alert" (see summary elsewhere in this issue of QST), a city-wide radio alert is held the third Friday of each month, with six rigs each putting 30 watts into a ground-plane antenna on 145-147 Mc., working from 1930 to 2130 EDST and working into 120 field units.

These alerts and practice drills pay off, interest-wise, training-wise and civil defense-wise. *Join your RACES group today!*

*Left:* This is part of the Charlotte (N. C.) Civil Defense Net group. The net has about 32 stations on its roll, about 20 reporting into each Sunday drill. In picture, sitting, are W4s FNV AYA BTZ and an SWL; standing are W4s CZR BUA ZQB (EC) REW and WXZ (SCM). *Right:* Andy Clark, W4IYT, served as EC for Dade County, Florida, for a number of years. He is one of the instigators of the Dade Emergency Net. This is Andy at his operating position.

### 1955 FIELD DAY NOTE

Field Day High Claimed Scores will appear in October instead of September QST due to the later scheduling of the contest this year.

### TRAFFIC TOPICS

On the first day of August, we put all present net registration file cards behind a tab marked "Inactive Nets." Since then, nets reregistered, or new nets registered, have been transferred to the "Active Nets" tab. This is regular practice in our net registration department. August 1st is the renewal date. September QST makes the announcement. November QST carries the first net list, followed by supplementary lists in QSTs for January, March and May. The complete, multithumbed net directory comes out in December.

Each year we try to aim at getting nets reregistered a little earlier, but so far we haven't been making it. One big reason for this is that compiling and maintaining the directory is a stupendous job requiring a lot of someone's time; then it must be checked, rechecked and cross-checked before it can be reduced to lithograph process. After that, it must be shepherded through the lithographing room and mail room in competition with regular bulletins like the CD Bulletin, LO Bulletin, Club Bulletins, 'Phone Bulletins, Bulletins about Bulletins, etc. ad infinitum. And because the Net Directory is somewhat voluminous, and getting more so each year, it is often by-passed to get at other bulletins which carry mailing suspense dates.

Each of you can help by getting your net registered *early*. This year, we'd like to start putting together the litho net directory around the first of November, have it completed by mid-November and in the mail by December 1st. We can't do this unless you cooperate by registering or re-registering *now*, and make it a standard practice on someone's part to keep that registration up to date immediately any changes are made.

We have registration cards (Form CD-85) available upon request. They're the same as last year's, and have space for the following information: (1) *Name of Net*; please adopt an official name and stick to it. (2) *Net Designation*, if any; most c.w. nets have designations and some 'phone nets have, such as EAN, TCPN, etc. (3) *Frequency (or -ies)*; give the exact frequency, not just the band. (4) *Days*; tell us *which* days, not how many; "daily" means every day, *including* Sunday. (5) *Manager*; the guy who runs the net, called NCS on some nets; what we want is the call of the head man on the net, to whom any correspondence can be directed. (6) *Time* the net starts and time it ends; please use standard time, and be sure to indicate which time zone. (7) *Direct Coverage*; area covered by regular net members, not through liaisons with other nets. (8) *Purpose* of net; this year, we're not registering social, or rag-chew nets, but only those with an emergency or traffic purpose. (9) *Starting Date*; if an old date, give the year; if a new one, the month and year. (10) *Net Control Stations*; list them; they go on our NCS mailing list to receive Emergency and Traffic Bulletins. (11) *NTS*; indicate whether or not the net is affiliated with the National Traffic System. (12) *Liaisons*; list the nets with which regular liaison is conducted. (13) Name and/or call of the person submitting the information.

Most of this information is transferred to a regular net file card. Original registration cards (the ones you send in) are kept on file for a year, then discarded. Use of the regular registration card is not required, but it's a convenience both to you and to us to use it. If not used, please give us the

information above by card or letter. *Basic* registration is the name of the net, frequency, days and time; without these four essentials, no net will be registered.

We cannot search through bulletins, reports or miscellaneous correspondence for net registration information. We'll use it as we come across it, but to be *sure* your net is registered, make a specific point of sending us the necessary information for that purpose alone.

Only one miscellaneous traffic report this month: The Early Bird Net traffic count for June was 428 messages. Since December 5, 1949, this net has conducted 1480 sessions and handled 23,311 messages.

*National Traffic System.* We seem to need a small "shot in the arm" about reporting. It's natural enough for net reports to fall off during the summer months, but now that NTS is an established institution among organized traffic circles, we'd like to feel that 100% reporting is the customary thing, not the exception. Can we have a bit better consistency in this regard, gang?

June reports:

RN7 (May)	48	299	...	6.2	37%

<sup>1</sup> Out of 26 sessions held

<sup>2</sup> Out of 44 sessions held

<sup>3</sup> Report by W9DO of 11 sessions for which he was NCS.

<sup>4</sup> Section nets reporting: KYN (Ky.); CVN (Calif.); QKS, QKS-SS and QKN (Kans.); MON-SMN (Mo.); CN and MCN (Conn.); NTX (N. Texas); WVN (W. Va.); AENB & AENP (Ala.); GSN (Ga.).

A complete list of NTS net managers at regional and area level may be in order; it has been quite some time since one was presented here:

*Area Nets:* Eastern Area Net—W8SCW; Central Area Net—W9JUU; Pacific Area Net—W7APF.

*Regional Nets:* 1RN—W1BVR; 2RN—W2LPJ; 3RN—W3NRE; 4RN—W4BVE; RN5—W4OGG; RN6—W6ZRJ; RN7—VE7ASR; 8RN—W8DSX; 9RN—W4KKW; TEN (Tenth Regional Net)—W0DQL; TRN (Thirteenth Regional Net)—VE3GI. The Eleventh and Twelfth Regional Nets have never materialized, being originally intended for the Mountain Area. These nets were absorbed into the Seventh and Sixth Regional Nets respectively and report into the Pacific Area Net.

*Transcontinental Corps:* Eastern Area Director—W8UPB; Central Area Director—W9JUU; Pacific Area Director—W6HC (until September 30th).

Maine and W. Mass. made perfect attendance in 1RN during June. W4OGG reports that morning sessions (0600 CST, 3645 kc., Mon. through Sat.) are still going strong. RN6 has good representation from California sections, not so good from others; a very fine RN6 Bulletin was issued in July. W9DO reported his eleven sessions of 9RN, and is filling in until new manager W4KKW takes hold. TEN conducts a session at 1700 CST in addition to the regular sessions at 1945 and 2130. VE3GI reports that VE2DR is holding down Quebec representation to TRN single handed, that Maritimes coverage is very spotty, and that the use of 7070 kc. has been dropped as of August 1st.

W6HC indicates that the following TCC stations submitted reports for June: W0KQD, W7CCL, K6BDF, W6ADB, VE7QC, K0WBB, W6IPW. Total traffic reported amounted to 189. Many TCC stations are off for vacations. W6HC announces his resignation as TCC Director effective September 30th due to the pressure of other business.

## BRASS POUNDERS LEAGUE

winner of BPL Certificates for June traffic:

BPL medallions (see Aug. 1954 QST, p. 64) have been awarded to the following amateurs since last month's listing: K2BJS, W3WG, W4COU, W4HDR, W8DAE, W0PZO.

The BPL is open to all amateurs in the United States, Canada, Cuba, and U. S. possessions who report to their SCM a message total of 500 or more, or 100 or more originations-plus-deliveries for any calendar month. All messages must be handled on amateur frequencies, within 48 hours of receipt, in standard ARRL form.

## HOBBY SURVEY

In a recent ARRL field organization survey asking about "any other hobbies" and "your favorite contest," answers came from all classes of appointees. Results apply in the main to the field organization group, of course. The typical appointee-operator has an input of 236 watts and operates 43 hours per month. His interest in broad terms shapes up as follows: 30% traffic, 30% rag chewing, 22.3% DX, 17.7% construction.

Favorite contest? Looking at the "big four" in ARRL affairs it came out like this: SS 40.4%, FD 31.9%, DX Competition 19%, V.H.F. SS 8.7%. The one favorite band? 80 got 68% of the votes, 40 got 15%. Looked at from the standpoint of all-band use the bands looked as follows: 160 2.2%, 80 38.7%, 40 20.5%, 20 18%, 15 5%, 11.4%, 10 6.6%, 6 1.7%, 2-and-above 6.9%. Half the gang used two favorite bands most of the time. Over a quarter of the gang have just one favorite band. Few use over three bands. 25% had emergency power for a home emergency station; 37% had mobiles. Answers about interests included such expressions as "What other hobby could there be?" "Are you kidding?" "Who could afford another?" "No favorite contest, I love 'em all." 20% insisted there could be no other hobby interest than amateur radio. But this group was outnumbered by those with other interests.

It is said that a man is fully alive only in proportion to his interests. There is a lot in that view but we amateurs have very little to worry about . . . to judge from the survey of other hobbies. We found over 100 hobbies listed by name! No indication of hobby-time for these other things was indicated. However, a variety in interests, the balanced life our *Amateur Code* indicates is by most standards rich in the things that make for contrast and triumphant living values. Seventy percent of our gang engage in five most popular additional hobbies among the one hundred: (1) photography 32%; (2) fishing 9.7%; (3) music 7%; (4) stamps 6.6%; (5) hi-fi 5.8%. Others run the gamut from bird watching and skin diving to breeding peonies, raising parakeets, canaries, tropical fish, dogs, keeping bees and building models. There's hardly any amateurs *don't* do when it comes to other hobbies, too!

• All operating amateurs are invited to report to the SCM on the first of each month, covering station activities for the preceding month. Radio Club news is also desired by SCMs for inclusion in these columns. The addresses of all SCMs will be found on page 6.

## ATLANTIC DIVISION

**EASTERN PENNSYLVANIA**—SCM, Clarence Snyder, W3PYF—SEC: NNT, RM: AXA. PAM: TEJ. E. Pa. nets: 3610, 3850 kc. In an effort to reorganize the AREC in Eastern Pennsylvania, NNT, newly-appointed Section Emergency Coordinator, is looking for ECs for the following counties: Adams, Bradford, Bucks, Carbon, Columbia, Cumberland, Dauphin, Delaware, Juniata, Lebanon, Lehigh, Lycoming, Monroe, Montour, Perry, Pike, Schuylkill, Snyder, Sullivan, Susquehanna, Tioga, Union, Wayne, and Wyoming. If your county is not represented, contact NNT and he will be happy to consider you for appointment. If you formerly held an EC appointment and it has lapsed and you wish to be reinstated, notify him and help build a bigger and better AREC in Eastern Pennsylvania. Talk it up before local amateur radio clubs and come up with your suggestion for the appointment. WUE has been aiding the New York State Civil Defense Net by monitoring 3993 kc. while radiological information is being passed, by standing by to QSP when skip conditions prevent direct contact. VUH is a member of the North Penn. ARC when he is home from his Army duties in Germany. His call there is DL4BX. JKH was married in June and honeymooned in Europe. MDO reports a new club in the Stroudsburg Area, the Pocono Amateur RC. Officers are MDO, pres.; MAA, vice-pres.; ZIV, secy.; and UCY, treas. The Club is working toward ARRL affiliation. VZJ, VRN, and KTO provided communication during the c.d. drill in Wyoming Valley. The Reading Radio Club, operating the Berks County C.D. trailer, PFT/3, furnished communications from the Reading Airport during the Women's Powderpuff Air Races. Stations operated from dawn to sunset on 3970 kc. for handling reports. BHC has been named deputy communications director for c.d. in Northumberland County. New OPS: OK and BNR. BNR is alternate NCS on the Interstate 'Phone Net. BIP has the new shack completed and ready for the opening of the E. Pa. nets. BUR reports eighteen 2-meter stations for the Centennial Parade. The Eastern Pennsylvania C.W. Net and the Pennsylvania 'Phone Net held a picnic at Hershey Park, Hershey, on Aug. 14th. Traffic: W3CUL 1331, YDX 355, WUE 228, BNR 187, TEJ 159, OZV 81, BFF 78, OK 73, DUI 65, PYF 33, EAN 20, ELI 19, PVY 19, BUR 16, UOE 11, UWP 11, EU 6, WQL 6, ZRQ 6, DGM 4, WJM 4, JNQ 3.

**MARYLAND DELAWARE-DISTRICT OF COLUMBIA**—SCM, John W. Gore, W3PRL—From the viewpoint of the SCM's visits to the many areas within the section, and also reports, and despite the inclement weather Saturday afternoon and night, which did not seem to dampen the ardor or enthusiasm, this section should in the final analysis show exceptional results in the Field Day Contest. Operation Alert resulted in considerable activity by amateur groups; typical examples being the Hagerstown group with OYX, OXL, JVZ, TJV, and YRK on the local net frequency of 3827 kc. tying into State C.D. Headquarters on 3820 kc., and St. Mary's group with BUD at C.D. Headquarters at Leonardtown handling the local net, consisting of ADQ, PPY, AVL, and ZZZK, who operated both fixed and mobile. ZZZK and AVL also relayed traffic via 2 meters to N3ZYB in Calvert County. The Governor having proclaimed the week of June 19-25th as "Radio Amateur Week," it was decided that it would be appropriate to hold a Victory Dinner in celebration of the signing of the Maryland License Plate Bill. This dinner was held June 22nd at the Park Plaza where those who were active in securing backing for the Bill, as well as Senator Dempsey of the Legislature and other guests, were present. CARC members NH, UYJ, LZZ, BYG, CJN, and KOU totalled 1064 points in the 1955 V.H.F. QSO Party on 2 meters. The Harford County C.D. Net is rapidly progressing in both attendance at regular drills and installation of

equipment at the local headquarters at Bel Air. Those participating regularly are SCPN/m3, K2GDH/m3, LDD/-m3, 0MZN/m3, 00KI/m3, and /3, 9Q0I/m3 and /3, RMY/3, SZY/3, UCR/3, 2YAY/m3, and 5ZOG/3 and /m3. The V.H.F. Contest of June 11-12 found CIQ and RAH operating at Gambrell State Park under CIQ, where they worked 101 stations in 6 sections. BNC, EPV, and VAM operated from their own QTH in the Hagerstown section. The Hagerstown group mustered 20 members participating full time, with others helping during their available hours during Field Day, and over 800 contacts were made. ECU has completed his 813 final and will operate on 40 and 20 meters. MCQ has acquired a 5-kw. gas-engine generator for emergency use after he returns from a month's trip to New Mexico. WV reports unexpected level of activity on the MDD Net during the early part of the period. HKS has a Viking Ranger. WC surprised himself with the operation of his 4-watt brief-case portable on 75-meter c.w. and 'phone. RV reports the Andrews Air Force Base Wind Bag Net now is operating on 7240 kc. The Radio Engineers Club of CREI in Washington is on the air with a kw. and the club call YXMI. EQK probably has reported from more remote locations by mobile into the MEPN than any other member. His latest accomplishment was to report in on his marine mobile from the upper Chesapeake Bay. AVL and BH have operated on the air with s.s.b. YYB and YYP, George and Merle, a father-and-son combination, completed their 10-meter beam on July 4th and are looking forward to highly increased activity. Their first contacts on the new beam were with stations in Bermuda and Puerto Rico. PGB is back on the air after a delayed recovery from "Hazel." Traffic: (June) W3WG 1130, WV 515, UE 112, MCQ 76, RV 66, PRL 41, UCR 37, BUD 25, WAF 10, OYX 8, PO 4, (May) W3MCQ 80.

**SOUTHERN NEW JERSEY**—SCM, Herbert C. Brooks, K2BG—SEC: ZVW. PAM: ZI. K2JEI has a new vertical on 40 meters. ZAS also is breaking in a new antenna. HDW reports less traffic this month because of the arrival of a new harmonic. K2JKC is a new traffic-handler who soon will be an ORS. State Headquarters RACES station was manned during "Operation Alert" by VQR, ZI, and SXX. More than 100 messages were handled during the test. The 6-meter net continues to hold weekly skeds every Mon. at 2030. Newcomers are always welcome. Burlington County Radio Club members are operating their club station, K2KED, and Area 10 RACES station on alternate Fri. nights. Area 11, Camden County, also holds drills on this night. SJRA Field Day totals topped those of previous years. The JP Net also was active on Field Day. ASQ has a new beam and a new transmitter. K2DZL is hospitalized. Don't forget those cards; Ben will appreciate your get-well wishes. K2MHD is Superintendent of Police, Allentown, N. J. HAZ is on the sick list. Hope you will be well soon, Bill. The SJRA is planning a bigger and better hamfest and picnic than ever. Contact CAG, the chairman, for details. UNT is doing FB with a QRP rig on 2 meters mobile. We need more mobile units in our present RACES and AREC drills. If you are not taking part in these drills, contact your EC or SEC for assignment. LS, VMX, and K2CPR continue to do swell jobs as Official Observers. The Burlington County RC has applied for League affiliation. Traffic: (June) K2HZR 254, W2RG 173, K2JKC 88, W2ASG 9, ZI 7, K2CPR 3. (May) W2HDW 14.

**WESTERN NEW YORK**—SCM, Edward G. Graf, W2SJV—Asst. SCM: Jeanne Walker, 2BTB. SEC: UTH/FRL. RM: RUF. PAMs: TEP and NAI. NYS c.w. meets on 3615 kc. at 6 p.m. and 6:30 a.m.; NYSS on 3595 kc. at 5:30 p.m.; NYS 'Phone on 3925 kc. at 6 p.m.; NYS C.D. on 3509.5 and 3993 kc. at 9 a.m., Sun.; TCPN 2nd call area on 3970 kc. at 7 p.m.; SRPN on 3970 kc. at 10 a.m.; ISPN on 3980 kc. at 3 p.m. At an ARATS meeting slides on A.C. Current and Its Application were shown with RPO explaining; also slides of the vacation trip of SEX to Florida. Hams in Clinton are forming a club. Contact KN2KXE for details. Other Novices in the city are LAN and OKK. A W.N.Y.S. Ont. V.H.F. "do" under the sponsorship of the Lockport ARC was held in that city. The feature of the evening was MTU of Cornell U., on "VHF Echoes from Aurora." SJV was the guest of ZOL and BTB at a meeting of the RAGS in Syracuse. The program was a paper given by ZGY, Inst. Eng. of G.E., on "Fundamental Measurements." MTU will be on 420, 144, and 50 Mc. from Colorado. TTU is going to Alaska with the AF. The c.d. fellows in Ithaca and Elmira are going strong on 2 meters. BTB received a Public Service award for her work in "Hazel." Officers of the Batavia ARC are HJN, pres.; IIE, vice-pres.;

(Continued on page 78)

**I**N February of this year we made our first appearance on this page. In the intervening months we have tried through this means to open the doors of Hallicrafters engineering laboratories to thousands of hams throughout the world. We hope we have been of service to you in the growing field of single sideband with articles on receivers, exciters and amplifiers. As the world's largest manufacturer of ham equipment, we will continue to cover these and other technical subjects in the future.

**B**UT let's look back for a moment on what has happened in the way of product development since February. We introduced the SX-96 with selectable sideband which promises to be the most popular medium priced receiver ever produced. In recent months the HT-31 linear amplifier made its appearance, giving "talk power" equivalent to a kilowatt of AM in a compact, table-top package.

**O**THER new and exciting products have been engineered for you, the hams.

**A**N extremely stable filter-type AM-CW-SSB transmitter/exciter (model HT-30) will be available soon. A new receiver (model SX-100) incorporating the highlights of the SX-96 — and then some — is in production. A complete, highly styled console made up of the HT-30, HT-31 and SX-100 — ready to operate — is planned for later this fall.

**I**MMEDIATELY available for ham, novice and short-wave listeners are popular receivers like the S-38D, S-53A, S-85, SX-99 and SX-62A. For industrial, emergency and Civil Defense use we have the low cost S-94 and S-95 FM receivers as well as our deluxe "Littlefone" two-way radio telephones.

**T**HE parade of new products will continue in 1956; but in this brief report we wanted to keep you posted on our plans for the immediate months to come. We hope that your plans will include Hallicrafters equipment.

# New

# Heathkit VFO KIT

MODEL VF-1

**\$1950**

Ship. Wt. 7 lbs.

Here is the new Heathkit VFO you have been waiting for. The perfect companion to the Heathkit Model AT-1 Transmitter. It has sufficient output to drive any multi-stage transmitter of modern design. A terrific combination of outstanding features at a low kit price. Good mechanical

and electrical design insures operating stability. Coils are wound on heavy duty ceramic forms, using Litz double cellulose wire coated with polystyrene cement. Variable capacitor is of differential type construction, especially designed for maximum bandspread and features ceramic insulation and double bearings.

This kit is furnished with a carefully precalibrated dial which provides well over two feet of calibrated dial scale. Smooth acting vernier reduction drive insures easy tuning and zero beating. Power requirements 6.3 volts AC at .45 amperes and 250 volts DC at 15 mills. Just plug it into the power receptacle provided on the rear of the AT-1 Transmitter Kit. The VFO coaxial output cable terminates in plastic plug to fit standard 1/4" crystal holder. Construction is simple and wiring is easy.

- Smooth acting illuminated and precalibrated dial.
- 6AU6 electron coupled Clapp oscillator and OAZ voltage regulator.
- 10 Volt average output on fundamental frequencies.
- 7 Band calibration, 160 through 10 meters, from 3 basic oscillator frequencies.

Open layout, — easy to build — simplified wiring.

Smooth acting illuminated dial drive.

Clean appearance — rugged construction — accessible calibrating adjustments.

Ceramic coil forms — differential condenser.

Copper plated chassis—careful shielding.

## Heathkit AMATEUR TRANSMITTER KIT

MODEL AT-1

**\$2950**

Ship. Wt. 16 lbs.

### SPECIFICATIONS:

Range 80, 40, 20, 15, 11, 10 meters.  
6AG7 ..... Oscillator-multiplier.  
6L6 ..... Amplifier-doubler  
5U4A ..... Rectifier.  
105-125 Volt A.C. 50-60 cycles 100 watts. Size: 8 1/8 inch high x 13 1/8 inch wide x 7 inch deep.

Crystal or VFO excitation.

Prewound coils — metered operation.

52 ohm coaxial output.

Rugged, clean construction.

Single knob band switching.

Built-in power supply.

Here is a major Heathkit addition to the Ham radio field, the AT-1 Transmitter Kit, incorporating many desirable design features at the lowest possible dollar-per-watts price. Panel mounted crystal socket, stand-by switch, key click filter, A. C. line filtering, good shielding, etc. VFO or crystal excitation—up to 35 watts input. Built-in power supply provides 425 volts at 100 MA. Amazingly low kit price includes all circuit components, tubes, cabinet, punched chassis, and detailed construction manual.

## Heathkit COMMUNICATIONS RECEIVER KIT

Four band operation 535 to 35 Mc.

Stable BFO oscillator circuit.

RF gain control with AVC or MVC.

5 1/2 inch PM Speaker-Headphone Jack.

Six tube transformer operation.

Electrical bandspread and scale.

Noise limiter—standby switch.

### SPECIFICATIONS:

Range.....535 Kc to 35 Mc  
12BE6 ..... Mixer-oscillator  
12BA6 ..... I. F. Amplifier  
12AV6 Detector—AVC—audio  
12BA6 ..... B. F. O. oscillator  
12A6 ..... Beam power output  
5Y3GT ..... Rectifier  
105-125 volts A.C. 50-60 cycles, 45 watts.

A new Heathkit AR-2 communications receiver. The ideal companion piece for the AT-1 Transmitter. Electrical bandspread scale for tuning and logging convenience. High gain miniature tubes and IF transformers for high sensitivity and good signal to noise ratio. Construct your own Communications Receiver at a very substantial saving. Supplied with all tubes, punched and formed sheet metal parts, speaker, circuit components, and detailed step-by-step construction manual.

MODEL AR-2

**\$2550**

Ship. Wt. 12 lbs.

### CABINET:

Proxylon impregnated fabric covered plywood cabinet. Shpg. weight 5 lbs. Number 91-10, \$4.50.

**HEATH COMPANY**  
BENTON HARBOR 9, MICHIGAN

## New HEATHKIT DX-100

MODEL DX-100

Shpg. Wt. 120 lbs.

**\$189.50**

Shipped motor freight unless otherwise specified. \$50.00 deposit with C.O.D. orders.

- R.F. output 100 watts Phone, 125 watts CW.
- Built-in VFO, modulator, power supplies. Kit includes all components, tubes, cabinet and detailed construction manual.
- Crystal or VFO operation (crystals not included with kit).
- PI network output, matches 50-600 ohms non-reactive load. Reduces harmonic output.
- Treated for TVI suppression by extensive shielding and filtering.
- Single knob bandswitching, 160 meters through 10 meters.
- Pre-punched chassis, well illustrated construction manual, high quality components used throughout—sturdy mechanical assembly.

## PHONE AND CW TRANSMITTER KIT

This modern-design Transmitter has its own VFO and plate-modulator built in to provide CW or phone operation from 160 meters through 10 meters. It is TVI suppressed, with all incoming and out-going circuits filtered, plenty of shielding, and strong metal cabinet with interlocking seams. Uses pi network interstage and output coupling. R.F. output 100 watts phone, . . . . . 125 watts CW. Switch-selection of VFO or 4 crystals (crystals not included).

Incorporates high quality features not expected at this price level. Copper plated chassis—wide-spaced tuning capacitors — excellent quality components throughout—illuminated VFO dial and meter face—remote socket for connection of external switch or control of an external antenna relay. Preformed wiring harness—concentric control shafts. Plenty of step-by-step instructions and pictorial diagrams.

All power supplies built-in. Covers 160, 80, 40, 20, 15, 11 and 10 meters with single-knob bandswitching. Panel meter reads Driver Ip Final Ig, Ip, and Ep, and Modulator Ip. Uses 6AU6 VFO, 12BY7 Xtal osc.-buffer, 57C3 driver, and parallel 6146 final. 12AX7 speech amp., 12BY7 driver, push-pull 1625 modulators. Power supplies use 5V4 low voltage rect., 6AL5 bias rect., 0A2 VFO voltage reg., (2) 5R4GY hi voltage rect., and 6AQ5 clamp tube. R.F. output to coax. connector. Overall dimensions 20 7/8" W x 13 3/4" H x 16" D.

## Heathkit ANTENNA COUPLER KIT

MODEL AC-1

**\$14.50**

Shpg. Wt. 4 lbs.

Poor matching allows valuable communications energy to be lost. The Model AC-1 will properly match your low power transmitter to an end-fed long wire antenna. Also attenuates signals above 36 Mc, reducing TVI. 52 ohm coax. input—power up to 75 watts—10 through 80 meters—tapped inductor and variable condenser—neon RF indicator—copper plated chassis and high quality components.

## Heathkit GRID DIP METER KIT

MODEL GD-1B

**\$19.50**

Ship. Wt. 4 lbs.

The invaluable instrument for all Hams. Numerous applications such as pre-tuning, neutralization, locating parasites, correcting TVI, adjusting antennas, design procedures, etc. Receiver applications include measuring C, L and Q of components—determining RF circuit resonant frequencies.

Covers 80, 40, 20, 11, 10, 6, 2, and 1 1/4 meter Ham bands. Complete frequency coverage from 2—250 Mc, using ready-wound plug-in coils provided with the kit. Accessory coil kit, Part 341-A at \$3.00 extends low frequency range to 350 Ke. Dial correlation curves furnished.

Compact construction, one hand operation, AC transformer operated, variable sensitivity control, thumb wheel drive, and direct reading calibrations. Precalibrated dial with additional blank dials for individual calibration. You'll like the ready convenience and smart appearance of this kit with its baked enamel panel and crackle finish cabinet.

## Heathkit ANTENNA IMPEDANCE METER KIT

MODEL  
AM-1

**\$14.50**

Shpg. Wt. 2 lbs.

Use the Model AM-1 in conjunction with a signal source for measuring antenna impedance, line matching purposes, adjustment of beam and mobile antennas, and to insure proper impedance match for optimum overall system operation. Will double, also, as a phone monitor or relative field strength indicator.

100  $\mu$ a. meter employed. Covers the range from 0 to 600 ohms. Cabinet is only 7" long, 2 1/2" wide, and 3 1/4" deep. An instrument of many uses for the amateur.

**HEATH COMPANY**  
A SUBSIDIARY OF DAYSTROM, INC.  
BENTON HARBOR 9, MICHIGAN

# "LITTLE MAC" does a big job!

## Ideal trimmer for VHF range

To keep pace with the continuing efforts of the electronic industry toward miniaturization of components, Hammarlund has introduced a tiny variable capacitor, type "MAC". This component provides the low minimum capacity essential for use as a trimmer in the VHF range.

The silicone-treated base is only  $\frac{3}{4}$  x  $\frac{5}{8}$  inches. Its rotor and stator are soldered assemblies of brass, nickel-plated for low losses, while the wiper rotor contact is nickel-plated beryllium-copper. Rotor and stator terminals are positioned to permit short leads. A threaded bearing is provided with flat sides to permit single-hole mounting without turning.

The new units are available to fulfill capacity requirements between 1.4 and 19.6 mmf. Try one in your next piece of gear.

If you haven't received your copy of the Capacitor Catalog, write to The Hammarlund Mfg. Co., Inc., 460 W. 34th St., New York 1, N. Y. Ask for Bulletin C9

# HAMMARLUND

(Continued from page 74)

K2DVC, secy.; TON, treas. "Gadget Nite" was held by the KBT Club. SJV spoke at an RAWNT meeting on AREC and c.d. The RARA V.H.F. meeting was held at the QTH of UXP. New officers are K2CEH, chairman; BCL, vice-chairman; ZS, secy. The SRPN picnic was held at Schoharie with NAI in charge of arrangements and prizes. FCD is going overseas with the AF. New officers of the Watertown ARC are K2GWN, pres.; FDI, vice-pres.; KN2JDE secy.; K2DUO, treas. The Club was commended highly by the c.d. director on its participation in the recent c.d. test. All members are in RACES. K2DVC, EC and RO for Genesee County, reports the C.D. Director, Mr. Clement, was pleased and impressed with their work in the c.d. test. All amateurs should make a special effort to obtain newspaper publicity in such matters, keeping Amateur Radio for Public Service before the public. The XYL of GBX received the call KN2OBX. K2GVJ set up a B&W for demonstration in communications for the local 6th graders. KN2ORF is a sergeant in the AF. EMW renewed as ORS. The Syracuse V.H.F. Club received nice publicity in the *Syracuse Herald-Journal* for Field Day activity. K2KIR is interested in getting a teen-age net going on 3720 kc. Contact Junior on that frequency. OWF, ILQ, HWC, SNI, UTH, and K2CEH are quite active on 6 meters. Traffic: W2RUF 333, ZRC 191, K2AMZ 126, OE 53, ZLT 42, GBX 36, HKA 36, DSR 34, RUT 27, FEB 20, SJV 17, DSS 14, WS 10, K2KIR 4.

**WESTERN PENNSYLVANIA**—SCM, R. M. Heck, W3NCD—SEC: GEG. RMs: UHN, NUG, NRE, and GEG. PAMs: AER and VKD. UJP reports the Breeze Shooters Hamfest was a success with 358 hams registering, plus the XYLs, SWLs, and jr. operators. The prizes were all given out, with 81QT, 3NCP, NJO, and MWG getting away with the main ones. The lectures, books, and other entertainment moved smoothly. JT entertained W0ENQ. ZUS now has a VFO. The BSN ground-wave contest unofficially reports 22 logs, 89 contacts, 180 miles, DX between VWA and SRUV. VEK recently was discharged from the Army. Sixty-six hams participated in the Allegheny County C.D. Drill. One net control completely mobile was PIQ/3. UHM and OUA are working on Scott Township C.D. ZDW is working DX on 20 meters. OKU is s.s.b. on 40 meters. The 2- and 6-meter beams are up at the SCARC's KWH. VKD had as visitors KA2DV, F7CV, BDQ, and UHN. The Indiana ARC was in Field Day with about 40 hams operating BMD/3 all bands at 60 watts making 320 QSOs. BRC is heard on 20-meter 'phone. From RAE: YXE dropped the "N" from his call and joined the 10-meter net. YKE was first in Erie with a DX-100 aired. WDK is getting nice signals from his also. The Erie Novice Net is set up by WN3ZNY Sun. at 1:00 P.M. on 3705 kc. SUK now is on 50 Mc. with 100 watts and a four-element beam. 81JG reports the SUK 220-Mc. n.f.m. signals get through the QRM better than his a.m. some 50-Mc. QSOs from Burgettstown were 5HEZ, 4FBL, 0MUG, and VEIEF. SUK is a new OES in the section. Traffic: W3WUQ 2193, UHN 25, KNQ 12, VKD 7, KUN 6, UTR 6, NCD 5.

## CENTRAL DIVISION

**ILLINOIS**—SCM, George T. Schreiber, W9YIX—SEC: HOA. RMs: BUK and MRQ. PAM: UQT. Cook County EC: HPG. Section nets: IEN 'phone, 3940 kc.; ILN c.w., 3515 kc. New Novice calls heard are AGU, RSY, UGA, and YCF. New General Class licenses are OFF and PND. Congratulations to the Elgin Radio Amateur Service Club and the Peoria-Area Amateur Radio Club on their affiliation with ARRL. MZW, formerly of Herbert, has bought a new home in Rockford. The St. Clair Amateur Radio Club really is going great guns in c.d. work, conducting drills weekly, planned by Novice RSY. MKN is back on mobile. JSQ checks in a MARS Net each Tue. night and then dashes madly to St. Louis to attend Naval Reserve drill. UWP is punching holes in the ionosphere with his new Elmac. KCV soon will be operating with a foreign call, per Uncle Sam's orders. BA writes a newsy letter on doings downstate; we wish we had space to reproduce in full. HPG was the only OO in the section to participate in the May F.M.T. What's the matter, NN and PBI? PHE is back on the air after extensive repairs. The CWC Amateur Radio Club is interested in c.d. work and is trying to work out a program with HOA, the Section Emergency Coordinator. KCW reports that during the recent c.d. test, 47 stations checked into the Watch Dog Net on 2 meters. BPU enjoys tuning his new Collins receiver and using his 10-16-20 beam. KLD has a new 829B final for 2 meters. NKR skeds Greenland daily on 20 meters. QGO and FHK returned from W6-Land. SKR's latest project is a grounded-grid amplifier using an 837. NIU is happy he had to overhaul the SRRC Field Day generator only once during the session. Are you more than 50 years old? Then you are eligible for the 3940 Over The Hill Club. Ask VXS. GDI is back to the air waves, having gotten fishing out of his system for the year, but GAS brags he has not been on the air for a year because of the same sport. VEY has a radio family. His son is EZA and his daughter recently was licensed as KN9AMD. Evidently Field Day in the section was a big success. We received Field Day messages from fifteen stations, all operating portable in the test.

(Continued on page 80)

**After three years engineering and design time...**

➔ *The NEW*

# PRO-310

Three years ago, Hammarlund set out to design and build an amateur receiver that would provide absolutely the last word in performance. And here it is—the **NEW Pro-310**.

This rig was designed with performance in mind. We've not cut corners. Frequency readings can be read to 1 part in 5000; the bandspread can be continuously calibrated over the entire range; it is exceptionally stable; construction is sectionalized; and many other features

are built in to give one thing—top performance.

If you've longed for a receiver that's as modern as this minute, you want a new Pro-310. Look it over at your dealers'. If he doesn't have one now, he'll be getting his stock soon. Get specs and other information either from him or by writing The Hammarlund Manufacturing Co., 460 West 34th Street, New York 1, N.Y. Ask for Bulletin R-9.

## HAMMARLUND

*Since 1910*

They are ABI, BA, DNN, DOP, HKA, IAW, NOZ, NZ, PCS, QLZ, TBP, THT, VSX, WJF, and YHP. If your station is not listed above, get after the chap you relayed to. Comes the cooler weather we are going to make an attempt to bring leadership appointments up to date. Please look at the dates on your certificates and if old, mail to your SCM for authentication. Traffic: (June) W9DO 734, CSW 183, VEY 144, BUK 109, YIX 52, VHD 44, CTZ 42, KLD 40, VSX 36, SME 82, LXJ 26, QQG 25, CZB 23, CEE 22, MRQ 19, VER 11, LL 9, BPU 6, BA 4, PHE 3, OR 2, JMC 1. (May) W9VER 26.

**INDIANA** — SCM, George H. Graue, W9BKJ — A state-wide contest sponsored by the Indiana Radio Club Council (IRCC) was partly responsible for the large club station activity in Field Day. A plaque goes to the winner. Field Day messages addressed to the SCM were received from AB/9, EIV/9, GHA/9, HSP/9, KOY/9, LDT/9, PRD/9, REG/9, RNC/9, UC/9, and UPI/9. CAEN reports 20 sessions with traffic of 29. WWT reports RFN traffic of 197. NTA reports for IFN with a traffic total of 235. Brass Pounders for the month are NZZ and TT. KLR has moved and is active again on 2 meters. JYQ has an s.b.b. exciter. New at East Chicago is N9AJY, the XYL of IBZ. NNT is in the hospital. VPJ has a new Hallcrafters. ELR is helping Novices prepare for the General Class exam. New at Kewanee are N9ADN, ADP, and AIL. New at Plymouth are N9AGF and AGG. CEA had a big write-up in the Wabash paper pertaining to his EC work. CKR is convalescing. BRM off to serve Uncle Sam. HRH is leaving Evansville. EHU received his DXCC. The TARS furnished communications for the Eagles Parade. Assisting were BRN, WQC, ABW, 4HKT, AML, and RYM, all on 29.6-Mc. mobile. Orr PAM, NTA, reports the following stations logged on Operation Alert in this section: AAY, AB, AQR, ASX, AYP, CBR, CC, CDW, CEA, CMT, CTF, DFW, DOK, DPT, DUD, EAE, EGQ, EHZ, ELR, EQO, GRN, HSG, JJC, JLG, JWI, JYO, KDV, LIT, LZL, MDC, NSX, NTA, OLL, PAS, PMT, PRO, PUE, QBD, QYQ, RJY, RGS, SAL, UB, UMS, UQQ, VNP, VNV, VSH, WBH, WIL, WRG, YEA, YVS, ZKW, ZRP, and ZTN. EGQ, LZL, and VSH are cited for outstanding work on this test. Vigo County has a 50-watt link unit as net control on 50.58 Mc. and 15 mobiles on that frequency. NH is keeping a weekly schedule with his brother 6GYK. AQR has moved to Tipton. DKR has a 9-watt mobile. N9AKE is new in Jeffersonville. ADW has a new rig and antenna. WWT reports that RFN handled 81 pieces of traffic, making a total of 313 pieces of traffic handled by IFN and RFN on the c.d. test. WAU has a DX-100. WTY has a Viking II. UQP has a 1-watter that gets out. Ye editor of *Ham News* visited NZZ, BKJ, and CLF. AB has the BC-610 working again and is on IFN regularly. Traffic: (June) W9NZZ 1224, TT 545, WWT 212, UQP 142, AB 136, CTF 105, TQC 103, EHZ 100, NTA 96, ZYK 88, WRO 76, JBQ 72, QYQ 72, WBA 50, BKJ 44, LIT 44, STC 43, EQO 37, VNV 31, PQA 26, JYQ 25, SVL 23, CMT 19, ZIB 19, CC 17, HRY 17, QR 16, AQR 10, DKR 10, DOK 10, ALL 8, AZF 8, GDL 5, BDP 4, NH 4, FGX 3, YVS 3, HSG 2, UWU 1. (May) W9AB 34.

**WISCONSIN** — SCM, Reno W. Goetsch, W9RQM — SEC: OVO. PAMs: ESJ and GMY. RMs: IXA and RTP. Nets: WIN, 3685 kc., 7 P.M. daily; BEN, 3950 kc., 6 P.M. daily; WPN, 3950 kc., 1215 Mon.-Sat., 0930 Sun. Wisconsin Mobile and c.d. frequency: 29,620 kc. UTV renewed ORS appointment and is on with a Viking Ranger. RQK has been doing some c.w. work this summer. New officers of the Fond du Lac Mike & Key Club are: LUQ, pres.; DIA, vice-pres.; VIK, secy.-treas. DIK got Nevada to complete his WAS. 7ZHT (ex-9KJM), now in Nevada, was back in Wisconsin during his vacation. IIB is designing a new high-power mobile. The BEN picnic was held at Waterloo July 10th. Some choice DX worked by RKP includes 4X4DF, OY2Z, SU1IG, ZM6AS and CT2BO. CCO is in the market for some mobile gear. WLW has a new Viking KW on the air. The Polecat Net Picnic was held at Green Lake June 12th. IIU is building 144-Mc. equipment. WN9UMK is building 144-Mc. converter. Rhinelander was host for the July meeting of WVRA (Wausau). We regret to report UIM as a Silent Key. QCH received his WAS certificate, and is busy on 4-Mc. s.s.b. with a 10A and Viking II. BNC is on 7-Mc. c.w. from his new trailer house. JEF, with 90 watts on 'phone and 200 watts on c.w., needs only Arizona for WAS. ANA can be heard from Yuma, Ariz., on 14,235 kc. YWI has a new SX-96. The mobiles of RBI, PYE, TRU, HMG, and IHB were active in the June C.D. Test with UTV, UGT, and MQK at the control station. A net certificate (WPN) was issued to SJL. Active in Field Day: SWQ, Madison; AIQ, Sturgeon Bay; HRM, Milwaukee; NUW, Wausau; SLT and ZGW, Eau Claire; RQQ, Crandon; UDU, Racine; DIK, Fond du Lac; DSP, Chippewa Falls; RQN, Superior; BXM, Marshfield; TCH, Beaver Dam. Weekly drills for stations licensed in the Wisconsin RACES net are held at 8 A.M. All ECs are requested to secure full participation in this activity. See you at the Central Division Convention, So. Bend, Ind., Oct. 15-16. Traffic: W9CXY 392, SAA 125, UTV 83, YZA 36, NUW 30, GMY 24, RQK 19, RQM 18, DIK 7, AJU 5, CCO 3, RKP 3, IIU 2, MUM 2, WN9UMK 2, W9WLW 2, IAL 1.

## DAKOTA DIVISION

**SOUTH DAKOTA** — SCM, J. W. Sikorski, W0RRN — Asst. SCMs: Earl Shirley, 0YQR, and Martha Shirley, 0ZWL. SEC: GCP. PAMs: GDE, BNA, NEO, and PRL. RM: SMV. LXD has moved from Sisseton to Centerville and will be in business with his father. Incomplete reports indicate that more South Dakota stations operated in Field Day than in any previous contest. SCT now is a member of AF MARS. RRN and family vacationed in Indiana and Illinois. NAB and BJH have built 6-meter mobiles. Net reports: C.W. Net, 13 sessions, 82 QNI, QTC 43; 75-Net, average QNI 31, average daily QTC 6. NAB has a new daughter. Very few reports were received this month. Please help out your new SCM, Les Price, FLP, Hermosa, and keep him notified of all your ham activities. This will be the last station activities from RRN, and again I want to thank all of you who have helped in the past several years. See you in Yankton in September. Traffic: (June) W0GDE 59, SMV 53, SCT 38, PHR 17, RSP 12, BQH 9. (May) W0WBW 6.

**MINNESOTA** — SCM, Charles M. Bove, W0MXC — Asst. SCMs: Vince Smythe, 0GQG, SEC: GTX. RMs: DQL and KLG. PAMs: JIE and UCV. Don't forget Sept. 9th to Sept. 11th, the dates of the Second Annual 10,000 Lakes QSO Party. Sponsored by the Minneapolis and St. Paul Radio Clubs to enable Minnesota hams to get better acquainted with each other, the party is open to all amateur radio operators to encourage everyone to make new friendships in Minnesota. Another gold cup was given to the most deserving amateur station in Minnesota. This cup is given annually by the Minneapolis Radio Club and is known as the Forrest Bryant W0FDS Award. The cup was awarded to AUI for his outstanding contribution to ham radio. As mentioned before, all amateurs in Minnesota are eligible to compete for this cup. All you have to do is write a letter to the secretary of the Minneapolis Radio Club giving the name of the ham you think is the most deserving and stating the outstanding contributions he or she has given to amateur radio. HFY is on the air with a pair of 6146s and a new antenna. VBS worked 21 countries on 40-meter c.w. in 5 months. OGH is building a receiver and experimenting with remote controls using transistors. KXC is back from Nevada after working with the AEC. WZZ worked New York on his first contact after getting his license. Gordie Simon's code class has produced two more Novices, BHT and BFU. Four Novices who have just received their General Class licenses are VRK, WDW, WZZ, and AIK. AZC is a new Novice. SYD is mobile. TYX is teaching 7 students code and theory. SYD is operating a station for the Boy Scouts. URQ and KJZ attended the Dakota Division Convention in North Dakota and had a wonderful time. Traffic: W0KLG 281, HFY 189, RLQ 146, TUS 135, KJZ 106, WMA 83, LST 82, MBD 73, QDP 73, UNG 66, WVO 55, TKX 54, LUX 52, GTX 44, UCV 38, BUO 31, NJZ 27, RVO 26, VRK 24, GQQ 23, IRJ 23, NTV 21, FCU 15, RLI 14, VEP 13, AFP 11, ZBL 11, OJG 7, MXC 6, OPA 6, SYD 5, QVR 4, HPT 3.

### MINNESOTA (10,000 LAKES) QSO PARTY

Sept. 9 (1900 CST) to Sept. 11 (2400 CST)

Sponsored by the Minneapolis & St. Paul Radio Clubs to enable Minnesota hams to get better acquainted with each other. The party is open to all amateur radio operators to encourage everyone to make new friendships in Minnesota. Rules: (1) Exchange signal report, city and state. (2) Any and all bands and any type of emission may be used. We suggest 3820 and 7220 kc. for 'phone, 3650 and 7050 kc. for c.w. (3) Scoring: (a) Minnesota stations, 10 points for each contact with another Minnesota station, 5 points for each contact outside Minnesota; multiply by the number of states, provinces and foreign countries worked. (b) Stations outside Minnesota, 50 points for each contact with a Minnesota station; multiply by the number of Minnesota cities or towns worked. (c) A station may be worked only once for scoring credit. (d) No time limits or power multipliers. (4) Awards: (a) Certificates to 3 highest Minnesota scorers, and for highest score from each state, province and foreign country. (b) Separate awards for Novices. (c) Separate awards for all V.H.F. scores. (5) Submit logs to: Contest, P. O. Box 512, St. Paul, Minn., before October 1, 1955. All entrants will receive complete results by direct mail.

## DELTA DIVISION

**ARKANSAS** — Owen G. Mahaffey, W5FMF — The OZK C.W. Net will take a vacation during the summer and will start again the first Monday in September with SXM in charge. Your SCM had the pleasure of attending the South East Arkansas Amateur Radio Club Hamfest in Pine (Continued on page 82)

If you operate 'phone YOU WON'T BE SATISFIED UNTIL YOU OWN

the completely new  
**664** VARIABLE D\*  
**CARDIOID**  
DYNAMIC MICROPHONE

**The 664 will equal a useful power increase of four times over commonly-used peaked microphones, and could well be the best investment, dollar-wise, in your shack**

Here is a totally new concept in microphones for amateur phone communication.

The cardioid (high directivity at all frequencies) pickup pattern enables you to have a *real* "arm chair QSO." The forward gain of 5 db\*\* allows you to speak at nearly twice the distance you have been working to a conventional microphone. Unwanted sounds in the shack are rejected nearly twice as effectively as by ordinarily-used non-directional microphones.

The response curve is tailored to put the highest degree of intelligibility on your carrier. Your 100% modulation is all speech . . . in full character . . . with bite and punch. This curve, compared to ordinary microphones, will give you up to 12 db more usable audio—without splatter or hash.

We invite you to prove to yourself that the 664 will outperform your present mike by a direct comparison. If it doesn't out-hurdle QRM, your distributor will refund the purchase price without qualification.

A peak in the response curve limits modulation to the peak value. A peak-free response brings the full power level to 100% modulation gaining an intelligibility increase equal to the peak in the average mike. The 664 is peak-free and gives the highest usable power of any microphone for AM, NFM and SSB.

New Variable D\* Dynamic Microphone operates on the principle of multiple sound paths to the diaphragm. Spaced apertures to the rear of the diaphragm are phased to provide cancellation of rear sounds and give full response to sound from the front.

This new principle enables the curve to be free from peaks or dips. Insures freedom of blasting and boominess from close talking. Eliminates effect from mechanical shock. High level —55 db. Acoustalloy diaphragm. Switch easily changed to relay control, if desired. Absolutely unaffected by moisture, humidity, or temperature.

Model 664. Without Stand.....Net Price: \$47.70  
Model 419. Desk Stand.....Net: 9.00

\*\*Forward gain is that compared to a pressure mike; actual front-to-back hemisphere pick-up ratio is 20 db.

\*Patent Pending

**Electro-Voice®**

ELECTRO-VOICE, INC. • BUCHANAN, MICH. • Export: 13 E. 40th St., N. Y. 16

Bluff. There were about 125 present and several nice prizes were awarded. There was some good entertainment, plenty to eat and everyone had a good time. Several official appointments were made. On returning home I met with the Fort Smith Amateur Radio Club in a pre-arranged special meeting where some urgently-needed appointments were made. As there will not be a Division Convention this year I would like to meet with other clubs in the State. Appointments made in June: HNU, PZB, and ANR as ECs; VTZ, JWL and EUQ as OOs; VAN, VYAL and EUQ as OBSs; HFE, VAN, WCM, NKH, VAA, DYS, UEC, VYM, and ZJI as OPSs. Traffic: W5CAF 82, JZL 2, PX 2.

**LOUISIANA** — SCM, Thomas J. Morzavi, W5FMO — Operation Alert 1955 brought out the SCM, SEC, 10 ECs, and 69 operators, mostly AREC members, in 7 major localities and a score of smaller communities, in support of the state civil defense operation. All in all, the final station tabulation looked like many of the Delta Net came in and took over for the 26 hours. IUG is to be commended for his efforts. Baton Rouge and Istrouma AREC met jointly in welcoming 1BDI on June 13th and the New Orleans group was host to Ed on June 17th. The topics were ARRL matters and amateur activities in general. DHV got his General Class license and is active on phone. DTM is a new ham in Lake Charles. Woose is in Lake Charles for the summer months. VRO, in Goose Bay, Labrador, is waiting for his Globe King to arrive to get on the air. ZAP has a B&W 5100 a.m. transmitter with a B&W 51SB si leband generator. He also is going mobile with a 75-meter rig in a '55 Pontiac convertible. After being off the air for a spell, GMR is back on 75 meters with a kw. VIC's harmonic now has his own call, KN5AUB. YSN meets BREN and the RN5 C.W. Net. The Greater New Orleans AREC is sponsoring another Labor Day "Week End in Old New Orleans. Write to Box 13003 and plan to attend this gala affair. K5FAA makes BPL again. Let's get some reports in. This column needs your help. Traffic: K5FFA 520, W5MXQ 152, EA 71, NAW 70, VIC 58, FMO 8.

**MISSISSIPPI** — SCM, Julian G. Blakely, W5WZY — Operation Alert was successful with 50 stations taking part. KYC was NCS, with ART as alternate. Operations were carried on continuously for 12 hours. Out-of-section outlets were obtained and the press wires were "scooped" on every important development. Stations making "OA" a success were KYC, ART, IHP/M, PFC, YFJ, BTM, CFL, VME, UTK, EWE, DAT, WZY, WZZ, NPO, GDW, FKS, ZZZ, KHB, LPG/M, IZS, VTL, VBO, CAC, TDO/M, UJK, UK, SQU, SFC, EGU, HCW, TVB, BJR, K5ANK, BYC, UTM, TAK, SRU, WMQ, TXK/4, ANK, BGU, BGC/5, TIE, AKM, PCD, 4GGG, 4MEP, and 4KWDU. During the above operation PFC and other Jackson stations participated in a city-wide alert called by the c.d. 10 meters was used. VQE was liaison for the two nets. Our Communications Manager, 1BDI, paid a visit to the Jackson Radio Club. Many members from out of town were present and the meeting was enjoyed by all. The section turned out for Field Day with 5 clubs beating the air waves. K5FGJ/5 was in there, all bands, 30 watts, and nine operators. SRG/5 had eight operators, RRE/5 nine operators, TFFV/5 five operators, and ZZZ/5 ten operators. Traffic: W5YFJ 105, JHS 58, EDE 21, BTM 20, DAT II, WZY 8.

**TENNESSEE** — SCM, Harry C. Simpson, W4SCF — SEC: RRV, PAM; PFP, RM; WQW. The C.W. Net will reopen as you read this, and RM WQW sincerely requests your presence on the C.W. Net for the fall rush. It meets 3635 kc. 1900 CST Mon. through Sat. Your PAM, PFP, also requests more attendance on the Tennessee Phone Net, Mon.-Sat. 0645 CST, 3950 kc., plus Tue. and Thurs. at 1800 CST and Sun. at 0800. The Memphis Hamfest was a grand success, with 250 hams from 13 states. Guests included Ed Handy, ARRL Communications Mgr., and Captain Don Ward, 3rd Army Chief of MARS. Field Day was a success in this section also, with your SCM receiving reports from twelve club stations. PL, still recuperating, thanks his many friends for their letters, calls, and best wishes. The Bays Mountain Club plans a Work-All-States Party for a week-end outing. BCA, HUT, and SCF visited the Clarksville gang. WQT received a PS award, also won that Club's SS award. AEE reports approved RACES plans now include Chattanooga-Hamilton County (July 5), Tennessee State, Dresden-Weakley County, Memphis-Shelby County, and Knoxville-Knox County. IIB reports 6 meters was used very successfully in the Chattanooga Area during the recent c.d. alert. FLW reports a good workout for Weakley County in the same test, as did BAQ from the Memphis Area. UWA, in Kentucky for the summer, sends regards to his Tennessee friends. Traffic: (June) W4OGG 501, PGP 186, IIB 109, HHH 93, TZZ 93, WQT 91, WQW 81, YMB 49, VJ 42, SCF 40, FLW 38, SJ 34, ZBQ 34, BAQ 26, UVP 17, UWA 15, CXY 12, AFD 10, HUT 9, K4BKC 8, WHHSX 6, BAO 4, DCII 4, FRB 4, STI 4, CLQ 3, KN4BNW 2, W4CLL 2, AEE 1. (May) W4TZZ 110, UVP 42.

## GREAT LAKES DIVISION

**KENTUCKY** — SCM, Robert E. Fields, W4SBI — SEC: CDA, RM: KKW. Acting PAM: NIZ. A large number of the Kentucky amateurs turned out for Field Day, the clubs turning in the highest scores and having the highest number of operators. Several Field Day messages were sent

to the SCM for a twenty-five (25) point credit. It sure is good to see so many working their gear with emergency power and operating conditions. Our next big day is the Lexington Hamfest Sept. 25th. CDA suggests that all Kentucky stations obtain copies of the ARRL Operating Manual and Emergency Communications Manual, free to ARRL members on request from either CDA or SBI. WNH is planning a 300-watt final for 2 meters. SBI now has an antenna up for 80 meters and hopes that it will work across the state line at least and also hopes to have a pair of 813s on before too long. JUI says he has a 13-year-old son interested in hamming who is up to 10 w.p.m. He also states that he is a real hard-boiled instructor. Traffic: W4KKW 182, QCD 165, ZDB 118, CDA 87, RPF 46, ZLK 40, ZDA 30, BZY 27, IISI 22, UWA/4 15, HJN 14, SBI 14, WMF 14, SDZ 10, SZB 9, KRC 8, IAY 6, CON 6, JUI 4.

**MICHIGAN** — SCM, Thomas G. Mitchell, W8RAE — Asst. SCMs: Joe Beljan, 88CW (c.w.); Bob Cooper, 8AQA (phone). SEC: GJH. Activities seem to have hit the summer slump after a successful Field Day. Conditions have taken a toll on the traffic nets and the hot weather seems to have driven most of us outside. Judging from the Field Day activity notices, there should be some new records this year. Despite the odds, many of the emergency nets seem to be functioning through the summer months as they well should. There is no new word from the SEC this month, but I am assured that he is continuing to work with the MIOC officials as mentioned in the last report. FGB reports that the call KQAA4 has been issued as a "Disaster Communications Service" for the St. Joseph-Benton Harbor Area and will be operated by Ground Observer Corps personnel. This station will use 1761.5 kc. (Ch. 9) and 1782.5 kc. (Ch. 12) for fixed and mobile work. This is the second such station authorization granted in Michigan. More details may be obtained from FGB. New officers ('55-'56) of the Catalpa Amateur Radio Society are: VVD, pres.; GBT, vice-pres.; UEO, rec. sec.; ELR, corr. sec. and treas. JKK says he needs some good dope on an 80-meter vertical antenna. Sounds like he is penned in. Anybody have any ideas for him? QIT sent some pictures of his neat basement shack and his magnesium three-element wide-spaced 20-meter rotator that weighs only 90 pounds. He should be ready for the DX openings that are starting. DUS is going after the DX business in an S-9 manner. He is charting the CRPL information about two months in advance and it is most interesting to note the accuracy of the predictions. His stacked 10-, 15-, and 20-meter beams above the 120 feet of tower will be there when the times are right. PRL is eager to become active again and solicits word from those having good equipment available for sale. Traffic: (June) W8NUL 221, JYJ 124, ILP 109, NOH 71, ZLK 50, DAP 40, RAE 40, NTC/8 34, FGB 33, IJ3 33, QIN 30, SCW 27, IV 22, SJF 21, WOX 15, HSG 13, HKT 11, COW 10, PDF 10, SRK 8, DSE 7, AUD 6, RVZ 6, PHM 5, INF 4, FSZ 3, WVL 2. (May) W8IV 31, OQH 20, SIB 2.

**OHIO** — SCM, John E. Slinger, W8AJW — Asst. SCMs: J. C. Erickson, 8DAE; W. B. Davis, 8JNF; and E. F. Bonnet, 80VG. SEC: UPB. RMs: DAE and FYO. PAMs: EQN and HUX. New appointees are MBE and PIJ as ECs; IZF as OES; and BOJ as OO Class IV. K8FCJ (4 operators) made BPL for May. We regret to report the death of DVP. GDQ reports excellent cooperation from Lorain Co. amateurs during the c.d. alert of June 15th. DCJ has procured a new Viking Ranger. The Springfield group has two club calls, NCM and TTE. VZE is trustee of the latter. SYZ worked all states as a Novice. MEI has become quite a 40-meter DX man, according to reports from the Dover Area. W2UKS/MM, aboard the SS *North America*, is operating all bands, both phone and c.w., during the summer Great Lakes cruise. The BSWRA, Akron, has scheduled its annual picnic for Aug. 28th at Happy 1.ays Camp. LVF is scheduled to do academic research work in Mexico City. The West Park Radios awarded loving cups to HFE, INW, AJW, and ZEU for their operating performances on Field Day. QCO has acquired a new harmonic. The Licking Co. amateurs held their Field Day at DSX's farm. The entire gang was practically rained out. HOS' seven-year-old daughter has received the call W8NBCU. Any younger amateurs in the section? The Cleveland Brasspounders had its generator go bad during Field Day after having made over 400 contacts with three transmitters during the first nine hours of operation. RBX reports the following from the Toledo Area: A proficiency award was given HNP for his help in setting up the RACES program in the Toledo Area; the Annual Radio Rifle Match, in which Detroit, Grand Rapids, Toledo, and Pittsburgh participated, was handled by PNY and YGR on 3610 kc.; the Toledo Club held Field Day beside a quarry so that members could fish or swim when the bands cooled off; BIQ is up to 93 countries on 21-Mc. phone; and the Bi-Annual QSO Party, a local affair, has been named "The Maynard A. Nelson QSO Party" in memory of HHF, who recently passed away. Cincy's *Mike and Key* reports that the GCARA'S Stag Hamfest will be another extravaganza. First prize will be a 75A-4 and second prize an Elmac AF-67. The Columbus *Carascope* informs us that PEN gave a talk on frequency measuring at the July 1st meeting; the CARA Picnic was held July 24th at Black Lick Woods;

# QUALITY PRODUCTS

BY

**B&W**

## AUTOMATIC T - R ANTENNA SWITCH

Fully automatic electronic antenna changeover from receiver to transmitter and *vice-versa*. Suitable for all powers up to legal limit. Ideal for voice operated SSB—AM phone and break-in CW—all with one antenna . . . ending annoying antenna changeover relay clatter. You can automatically select one antenna for receiving and transmitting, getting an actual receiving signal gain from 1 mc to 35 mc. Because the Model 380 is broad band, there's no tuning or adjustments to make, and as a fail-safe device, it protects your final amplifier, low-pass filter, etc. Power loss on transmission is almost unmeasurable. Operates with either 52 or 75 ohm coax line.

## LOW PASS FILTERS

Fight TVI by attenuating undesirable harmonics and spurious radiation by a minimum factor equal to 17,780 to 1 with this new B&W low pass filter. Wave Guide principle and novel multi-sectional construction mean more attenuation in less space at lower cost.

ALL OF THESE FINE B&W products are available at leading distributors' everywhere.

## MATCHMASTER

Three valuable instruments in one, the Matchmaster can be used as a dummy load, direct-reading r-f wattmeter, and an integral SWR bridge, for fast measurements on coaxial feed lines, antennas, and transmitting equipment.

## SINGLE SIDEBAND GENERATOR

The 51SB generator offers sparkling SSB performance with your present B&W, Collins, or Johnson transmitter, on 80 through 10 meters with the output frequency control presently in your transmitter.

## 1 KW PI-NETWORK TANK COIL

A high-power integral bandswitched pi-network tank coil for maximum efficiency from 80 through 10 meters. For Class "C" or linear operation. Minimum "Q" of 300 over entire operating range.

## MULTI-BAND FREQUENCY MULTIPLIER

Makes transmission on 80 through 10 meter bands available at the flip of a switch. Ideal driver for class "C" or linear amplifiers. May be equipped for use as low power transmitter.

## TYPE HD HEAVY DUTY INDUCTORS

These rugged Type HD Heavy Duty Inductors, with a 1000 watt rating, are available either end linked, center linked, or variable linked.

**Barker & Williamson, Inc.**

237 Fairfield Ave., Upper Darby, Pa.

FYW has constructed a two-over-10-over-20 stacked beam; WN8ABM, a YL, worked a KP4 on 15 meters; OMY has made WAS; and SJQ has received his General Class license. Northeastern Ohio's *Ham Flashes* states that BYT has installed an all-band transmitter in his car; HLX has erected a 60-foot steel mast for various antennas; MID received a scholarship to the King's Point Merchant Marine Academy; HRV and JIF are running a code and theory class in East Palestine with six licenses resulting to date; and TNL is operating a Globe King on 75 meters. It was necessary to cancel a number of appointments this month because of non-reporting on the part of the appointees. This is unfortunate but, on the other hand, only "live wire" appointees aid in keeping this section at its high activity level. Traffic: (June) K8FCJ 327, W8DAE 206, MVJ 90, AMH 171, HDA 116, AJW 109, PM 102, ARO 100, IIR 88, AJH 86, GDO 83, HFE 74, INW 72, HNP 52, RO 47, FJV 46, AL 39, JHH 30, MQQ 30, QXH 30, HPP 25, EQN 20, GZ 20, LHJ 18, ET 8, NPP 8, PMJ 8, QXQ 8, TLW 6, VTP 6, LGR 5, KXN 4, STR 4, URN 4, WON 4, WYL 4, DCJ 3, JDN 3, LMB 3, PFP 3, APC 2, AQ 2, AZR 2, JMD 2, RFX 2, VUS 2, BUM 1. (May) K8FCJ 759, W8IFX 88, MQQ 62.

## HUDSON DIVISION

**NEW YORK CITY AND LONG ISLAND** — SCM, Carleton L. Coleman, W2YBT — Asst. SCM: Harry J. Dannels, 2TUK. SEC: ADO. PAM: NJL. RMs: VNJ and LPJ. New appointment: K2ABW as ORS. At the time this column is being written, the section is in the midst of a hot spell of weather and the mobiles are out in full force. Incidentally, all mobiles are urged to sign up with their local EC for AREC work. Your assistance is needed and your mobiles can perform important work in time of emergency. VNJ announces that the NLI Net (3630 kc., 1930 EDT/EST) resumes full daily schedule on Sept. 5th. VNJ and OBU operated from the Statler Hotel handling traffic for the Walther League Convention. K2HYK's antennas are up an extra few feet to help his traffic count go higher, too. Many of our stations enjoyed vacation trips with ham radio gear accompanying them. JGV/1 made a good traffic score from W. Brookfield, Mass. KGN has 1/2 kw. on 20-meter c.w. IN has returned to the low-frequency bands but continues 144-Mc. activity. YSL has a new crystal converter for 144 Mc. K2EQH finds that his OBS skeds on 20 meters meet with the hearty approval of the local gang, who now hear ARRL bulletins regularly. K2AMM is happy to see increased 220-Mc. activity in Nassau County. K2OAZ is a new call at IJ. OBU is now heard on 'phone. All April CD Party N.Y.C.-L.I. 'phone entries, DLO, OBU, TUK, and EEN are Lake Success RC members. That should be a challenge to other clubs with appointment-holders. Let's have more section activity! PZE now is located in Smithtown. Field Day activity was at a peak this year with many N.Y.C.-L.I. club entries. The Eastern Suffolk RC, K2EC/2, with 18 operators, was located at Water Mill. DPQ/2, the Huntington RC, cooperated with disaster and canteen units of the Red Cross and operated from Huntington with 5 transmitters and 30 operators. YKQ/2, the Lake Success RC, had 20 operators and 5 transmitters at Bethpage. The Nassau RC, BVL/2, used its '54 site at Rockville Center. Several clubs moved outside the section: The Tuboro RC, LG/3, and the Order of Boiled Owls, MUM/3, traveled to the Eastern Pennsylvania section while the Brooklyn Poly RC, BXK/2, ventured to Asbury Park. K2CUI is on his annual trip to F- and HB9-Lands. During "Operation Alert," VNJ spent 36 hours at JVG control center. Officers of the Frog Hollow RC, K2QFQ, are AZA, pres.; KEB, secy.; FSM, treas.; and KDO, trustee. 4YFS/2 is on 75 meters from Bethpage. DLO built the W2HDZ filter for 50 Mc. from a QST article and it works fine on his TV set, enabling him to take part in recent 6-meter openings. K2LYD has a *Handbook* design 6146 rig. YHP completed a crystal converter for 144 Mc. K2CMV added four new countries to his log. EEN put up a new 14-Mc. ground plane. KN2JTW has 6BG6 rig and HQ-129X. K2DW has his WAC certificate endorsed for 3-way s.s.b. work. Please continue mailing all activity reports to TUK. Traffic: W2JOA 152, JGV 151, K2ABW 81, HYK 72, W2TUK 49, K2AMP 23, W2VLS 14, K2KXZ 11, W2EC 10, PF 9, OBU 8, K2CRH 6, W2EEY 5, IN 5, MDM 4.

**NORTHERN NEW JERSEY** — SCM, Lloyd H. Manamon, W2VQR — SEC: IIN. PAM: CCS. RMs: EAS, NKD, and CGG. The Irvington Radio Amateur Club has suspended activities for the summer season. CVW now is settled in his new QTH, and hopes to become more active again. DRV finds that time slips by very rapidly and sends in a five-month traffic report covering the period February to June. We will list the total of 62 in this part of the column to eliminate confusion. Thanks, Bob, even if it is late we appreciate it. KN2KHZ now is K2KIUZ, having passed the General Class exam on July 6th. Congrats, Dave. He was very active in DX work while a Novice, running up a total of which to be very proud. The 15-w.p.m. CP did the trick for Dave and helped him on to the new ticket. As a further reward the XYL has presented him with a new jr. operator, David Alan. K2HXP has a 6146 rig on the way. K2GLS participated in his first Field Day and was very

favorably impressed. EFJ won the Irvington RC hidden transmitter hunt. The "booby" prize went to WFK who, according to reports, had to be roped into the site. Many activity reports have been received on Field Day activities. K2GAS is in bad shape; he is on with the six-watt exciter fighting the QRM. K2GAN and K2BFE are organizing a civil defense communications net for New Providence. A remarkable Field Day job was done by VAV and HJD. They joined together as a team and with a 30-watt transmitter worked right on through the entire contest period. The heavy rains slowed them down a bit, but never was the rig silent. A special Field Day QSL card is the reward for any station working them. In fact, the cards come in two designs and are sure FB. A great deal of credit goes to these two fellows who have the real old-fashioned Field Day spirit. K2BWQ has a new 75A-4. The KWSI has not been delivered as yet. K2EUN has left for Northern Texas. Drop a line to the local SCM (page 6 QST) for a transfer of your ORS appointment. Walt, K2AFQ is off the air because of receiver trouble. K2GRU received his Eagle Scout award. K2GBB, EKO, and CCI graduated from Teaneck H.S. in June. All plan to enter college in the fall. K2DOX is a graduate of Xavier. NIY attended the telephone company meeting in St. John, Canada, and met VE1HQ, also at the meeting. K2BAY has a new SX-96 but no transmitter; a bad combination for the nerves. K2DHE is toying with the idea of building a new s.s.b. rig. NIE is mobile every week end on the high seas. Traffic: W2EAS 180, K2GFX 52, BWQ 43, GAS 34, EUN 12, W2NIY 2.

## MIDWEST DIVISION

**IOWA** — SCM, Russell B. Marquis, W0BDR — As the new SCM I wish to extend the thanks of the Iowa gang to PP, the retiring SCM, for the faithful service he has rendered to the Iowa Section. Field Day entries: BXR, BBE, RMG, WML, YWW, ERG, QVN, MIEL, AGB, GTF, TUC, JUI, IUY, RWG, KRU, MLY, TMY, K0BPR, and ANO. QVA renewed ORS and RM appointments and was host to BLII, LJW, and CGY. BLH, the Tall Corn manager, visited several Tall Corn members on a swing around the State. SCA and UJC received Asst. SCM appointments. DDV was mobile while on vacation in Arizona. KGX and PIK are also were mobile on their vacations. BFW and PIK are sharing NCS duties during the summer for the Iowa YL Net. New stations are KN0BMB, KN0BMC, KN0BDO, and K0BLI. AEB has a new vertical for 80-meter s.s.b. UCE has the Ranger finished. QLU reports increasing activity on 50 Mc. with the Cedar Rapids Club using the band for intercom during Field Day. Nineteen attended the Tall Corn party in Cedar Rapids. The Charles City Club was host at the 160 'Phone Net picnic. SCA has a new Ranger VFO. The Central Iowa Radio Club held a picnic June 12th. The Fairfield High School Radio Club was organized Jan. 1st with 30 members. Officers of the Sioux City Radio Club are TLC, pres.; JKT, vice-pres.; UIJ, secy.; AQI, treas.; SQE, reporter; AZR, sgt. at arms. Traffic: (June) W0BDR 1073, PZO 902, SCA 901, CZ 261, LJW 77, QVA 74, EHH 26, BLH 22, UCE 22, LGG 21, OXY 10, PAN 9, PUR 5, FDM 4, NGS 3, PKT 3, UTD 2, JUI 1. (May) W0XNY 9.

**KANSAS** — SCM, Earl N. Johnston, W0ICV — SEC: PAH. PAM: FNS. RM: KXL/NIY. Ten Field Day groups reported their activities to the SCM this year. Field Day groups reporting were SeKan Radio Club, Ottawa Emergency Radio Club, WDAF-TV Radio Club, Central Kansas Amateur Radio Club, Eldorado Amateur Radio Club, Radio Club of Leavenworth Senior High School, Johnson County Radio Amateur Club, Hutchinson Amateur Radio Club, Kaw Valley Radio Club of Topeka, and GCH at Oakley. QGG is a new OBS operating on 3610 kc. at 1830 Mon., Wed., and Fri. FEO is attending ROTC Camp at Fort Carson, Colo., reporting on QKS from there on MARS station. EOT acquired an XYL June 26th. Hats off to one of the newest and most active radio clubs, the Wheat Belt Radio Club. It was organized about six months ago but already has 30 members, 70 per cent registered with AREC, conducted a very successful Field Day, has applied for ARRL affiliation, publishes a club *Newsgram*, and has gained very favorable publicity in several newspapers. UOL is president. The Eldorado Amateur Radio Club was given FTW's 300-watt rig for a club station and hopes to be assigned Jack's call in memoriam. The EARC held a family picnic for more than 36 hams and their families at Lake Eldorado June 5th. Traffic: (June) W0IFR 408, BLI 336, CET 299, NIY 201, DEL 137, OIH 135, MNG 92, SVE 71, FDJ 48, EOT 34, FNS 32, SAF 23, TNA 23, YFE 16, LQN 11, YVM 10, FHT 8, WWR 7, UAT 5, QGG 4, RXM 4, ICV/MJ 3, LBJ 2, YJU 2, W0YVY 2, W0YVY 1. (May) W0LBJ 35, NFX 19, KN0AUIW 7.

**MISSOURI** — SCM, James W. Hoover, W0GEP — SEC: YRF. PAM: BVL. RMs: OUD and QNO. Ordinary activities were curtailed somewhat in June while preparing for Operation Alert and Field Day. CPI reports static is making traffic-handling difficult on 75 meters. GBJ reported a wet Field Day in Springfield. OMM visited ORF. This year is the 30th anniversary of EBE. EZMI visited QMF. PWN is now equipped for VFO, multi-band operation. WAP reported an enjoyable dinner and ragchew attended

(Continued on page 86)

## A PAIR OF EIMAC 4X250B's— the easy, modern approach to a compact one-kilowatt CW and SSB rig

You'd be amazed how easy it is to build a one-kilowatt rig using Eimac 4X250B radial-beam power tetrodes. Each of these bantam tubes handles 500 watts input with only 2000 volts on the plate. A pair in the final amplifier provides a kilowatt with the power supply and transmitter combined taking only a fraction of the space required for an old-fashioned kilowatt rack.

The straight forward modern approach afforded by 4X250B's allows simple circuit design. Driving power is so low that annoying TVI-producing harmonics generated in the driver stages are minimized. Low feedback capacitance makes stabilization of the amplifier stage easy.

The versatile 4X250B can supplant the famous 4X150A, and it offers the advantages of easier cooling and higher power. No forced-air cooling is required during stand-by periods if convection air is provided properly.

For further information on the new 4X250B, contact our Amateur Service Bureau or visit your Eimac distributor.

### TYPICAL OPERATION

#### 4X250B Radial-Beam Power Tetrode (Frequencies to 175mc per tube)

	Class-C CW or FM Phone	Class AB <sub>1</sub> RF Linear
D-C Plate Voltage	2000v	2000v
D-C Screen Voltage	250v	350v
D-C Grid Voltage	— 90v	— 50v
D-C Plate Current	250ma	250ma*
Zero Sig D-C Plate Current	— —	100ma
D-C Screen Current	25ma	15ma*
Peak RF Grid Voltage	115v	50v*
Driving Power	2.8w	0w
Plate Power Input	500w	500w*
Plate Power Output	410w	325w*

\*Max Signal

An Eimac air system socket with built-in screen by-pass condenser provides optimum amplifier circuit stability and cooling arrangements for the 4X250B.

**EITEL-McCULLOUGH, INC.**  
SAN BRUNO • CALIFORNIA

by 17 hams in Grandview, June 23rd. His work has kept him from traffic. ETW graduated from St. Louis U. with a B.S. degree in physics. CKQ has qualified for a 2500 Trafficer certificate. RTW received an ORS appointment. SAK has applied for an OO appointment. Field Day operation reports were received from DZT, Springfield; SXY, Sedalia; VTF, Fayette; FLN, St. Louis; RFU, St. Louis; and K0ACK. The Suburban Radio Club installed antennas at its new QTH in time for Operation Alert. A combined net roster for MON and SMN has been published by SAK and VTF in *MO* News. Advances from Novice to General Class were made by TDT and ZWP. WN0WEQ received his Technician Class license. GEP visited the Northwest St. Louis Radio Club to discuss AREC plans and activities. BZK is working in Chicago during his summer vacation from school. 2- and 6-meter activity is picking up in the St. Louis Area. Traffic: (June) W0CP1 1182, GAR 518, GBJ 148, VTF 129, OMM 104, SAK 90, RTW 79, OUD 71, CKQ 44, BVL 42, HIR 38, HUI 31, VPQ 26, KIK 17, ECE 13, MFB 10, BUL 7, EBE 5, KA 4, QMF 4, TCF 4, GEP 3, MRQ 3. (May) K0FCT 247, W0HU1 26, RCV 14, QMF 8, VFP 3, ETW 1.

**NEBRASKA** — SCM, Floyd B. Campbell, W0CBH. Asst. SCM: Tom Boydston, 0VXY. SEC: JDJ. From the radiograms received at this office, there was a lot of activity on Field Day. FQB really has been organizing the c.d. system around Omaha. HMN has a new home-brewed 6-meter rig. RHL and his XYL spent 2 weeks touring California before leaving for duty in Okinawa. QKR really was busy during the recent storm at Gering and Scottsbluff. The new mobile (QKR) is fashioned after the Mighty Mo out of a recent QST. UOB is a full member of the Soo Radio Club, along with being chairman of the SRC and a member of the Sidney Area TVI Committee. AFG and DQN also are members of the SRC. We are sorry to report that GDZ has been transferred to W3-Land. Tiny did a very nice job as EC of Western Nebraska. JDJ spent a month in California recently. VNI is the new call of the Norfolk Radio Club. The UP Radio Club meets every other Wed. on 3940 kc. at 8 p.m. This is not restricted to employees of UP but is open to everybody. North Platte can boast of having 20 employees eligible for the club. Thanks to the many s.s.b. and a.m. stations for clearing the frequency during a tornado in Western Nebraska. VQR was on at Scottsbluff with loads of traffic and personally recognizes the following for their assistance: EMY, TIP, AFS, DPT, ERM, KLB, K0WBF, UFZ, LEF, EUT, BLM, and PUT. Traffic: (June) W0PMV 89, DDT 78, ZJF 66, HTA 48, K0WBF 40, W0VYX 22, AEM 16, POP 14, CTH 11, AGP 8, EGQ 8, FR8 8, KVM 8, ORW 8, TIP 8, VGH 7, HQN 6, OCU 5, KDW 4, KLB 4, PON 4, LEF 3, LZL 3, QVY 3, K0BDF 2, W0CBH 2, DPU 2, GTW 2, NBS 2, RAMO 2, SZL 2. (May) W0KDW 12, FQB 6. (Apr.) W0KDW 39.

## NEW ENGLAND DIVISION

**CONNECTICUT** — SCM, Milton E. Chaffee, W1EFW — SEC: LKF. PAM: LWW. RM: KYQ. MCN and CN 3640 (0645 and 1845), CPN 3880 (1830), CTN 3640 (Sun. 0900), CEN 29,580 kc. Traffic on CN reached 200, averaging 8.3 messages and 9.1 stations per session. MCN handled 108 with 4.8 and 6.4 as the same type averages. RGB, KYQ, and LIG rated QNI honors on CN while RGB, IBE, and RFJ led on MCN. Operation Alert apparently went off well. Bristol C.D. was manned by CKA, CLD, and RLN. Southington C.D. operation included ZZK, EFW, and Novice EQL. TJV Area 4 was operated by RGB, STT, WHR, ZKE, AKV, and PIP. PHP reports activity by IJD, JWW, YFG, ZJY, JYI, RRE, QMB, EBO, UQV, and MHF in their respective towns, and they handled 106 messages on 2 and 10 meters. CKA is on with a new Globe Champion. New Novices in Southington are GAV and GFL. OO reports were received from BVB and RFC. ZJY and ZJZ are operating portable for the summer at Lenox, Mass. EZY, age 13, is a new New Haven Novice. RMW has resigned as EC of Norwalk to give somebody else a chance. FB bulletins were received from the Middlesex and Manchester Clubs. FYM is a new Middletown Novice. New Middlesex Club officers are EGX, pres.; EWD, vice-pres.; ZIII, secy.; and ZBL, treas. New ECs are QMB and KJT. Renewals include UTZ, UJG, RFJ, and BDI as OFS; PHP as EC; and ORP and BDI as ORS. Have you checked your expiration date lately? UIZ reports operation at Mt. Equinox, Vt., in the V.H.F. Contest on 50, 144, 220, 432, and 3300 Mc., DX on the latter being 100 yards. Manchester claims 46 hams — one for each 800 population. Can any town top that? Connecticut Field Day scores should be good as many signals were heard on all bands. Eleven messages were received by the SCM. BDI/I made 396 points with car mobile on 80- and 10-meter c.w. YYM/WPO have left the hills for a new QTH in Windsor Locks. ORP reports an expected break in his sked with 3FQB, which has been going nearly 9 years. EOB has been transferred back to Chicopee, Mass. YLII recently was elected to Eta Kappa Nu, honorary E.E. fraternity at Rensselaer. Traffic: WYBII 209, CTH 163, RGB 144, AW 84, TYQ 73, EFW 72, LIG 70, KYQ 68, NJM 68, UED 59, BDI 32, ZDX 28, KV 23, YNC 17, LV 13, HYF 6, ORP 1.

**MAINE** — SCM, Allan D. Duntley, W1BPI/YVA — We regret losing WRZ as PAM because of poor health; but

are very glad to announce the appointment of TWR as PAM. You have a hard job, Wes, to fill Hap's shoes, but we know you can do it. Hats off to the Augusta gang for getting FRS/1, a station to be proud of. BYK and TVB did yeoman service during Operation Alert, as did many of the other boys in all counties. FD is back on the mountain helping to "Keep Maine Green" from his perch 3 flights up in the tower. It's a good spot to work 2 meters and Oscar says all you guys and gals are always welcome. The PAWA is quite busy issuing WAM certificates. Keep them coming in, boys. The QEEs are waiting for a bundle from heaven. The strange sound heard on "Heartbreak Ridge" are attributed to LQ modulating WRZ's rig. Jet also called on quite a few of the Augusta boys as well as your SCM. ZAG has a new mobile rig. The ZALs are now three. Congratulations on the new harmonic! EOP finally has cut some holes in his new Chrysler and is back mobile. Also KDE "operated" on his new Buick and is now putting out his usual lusty signal. WXI has joined the Vikings — husky boys, the "Norwegians." MFC now twists the knobs and dials at WTWO/TV in Bangor. Traffic: WILKP 85, WTC 83, EFR 46, YVW 44, UDD 36, BBS 35, TWR 26, BX 20, LYR 19, BAD 16, QUA 14, ZMK 12, TGW 8, YVN 7, BDP 4, WHV 4, DMV 2.

**EASTERN MASSACHUSETTS** — SCM, Frank L. Baker, jr., W1ALP — New appointments: SRG as OBS; ZWQ and WFQ, Alternate Radio Officers for Sector 1-B, as ECs. Appointments endorsed: DW Westwood, OTK Somerville, MKW Dennis, PST Brookline, as ECs; DWO and BY as ORS. QLT has applied for OO appointment; RQZ as EC for Abington and also as OBS. The South Shore Club held its annual banquet and installation of officers. Most of the clubs in this section were out on Field Day. As SCM some Field Day messages were received direct from IA/1, where I was doing some operating; others came by mail. UDC is the new c.d. director for Dedham. Sorry to have to announce the death of QIT, a cousin of SMV. Heard on 2 meters: TBX, LYL, QXX, ZGO, APV, FFR, FDB, BYI, mobile ZYO, WBR, PSG, and SIV. UFJ is on 75 meters. There was a lot of activity during the V.H.F. SS. RP is back on 75 meters and is going after WAS. PNH took part in the May F.M.T. Most of the c.d. groups were on during the nationwide c.d. test. IA, in Quincy, as head of Sector 1-B, was on for the full 24-hour period, with DXQ and ZIII staying all night. Others on were ALP, WFQ, ZWQ, VTT, CRO, VJC, and YJG. In the various towns these operators were among those active: MME, DUO, SMV, SH, WUW, VPR, AYG, ISU, FWS, WSN, WZN, CLF, MGL, GKN, QVN, HSN, IPE, YFA, OLP, QON, DW, KWD, ZYO, and LOS. UNA, an instructor at the Swampscott High School, reports a radio club where code and theory was given and the following new Novices: EVJ, EUU, ETW, EUT, EUY, and ETL. Other members are ZHG, ZBH, and BYB. OGG was the examiner. AVY has been ill. THO says he has a patent on a one-element 6-meter beam. The Framingham c.d. group has a 6-meter Gonsset which was operated by ZOP, QVK, and MEG during Operation Alert. More units will be on 146,850 kc. The Braintree Radio Club held a meeting. BY is busy at work. SXD is going to DL1-Land. LMU visited ex-8GP in Ohio. PIW plans a vertical for 10 meters. QMU is b.ilding power supplies. TTY has a Heath DX-100. HOL is on 6 meters. RM has two new cars. CLF says he is handling a lot of new traffic from Maine. The Hingham Club was out on Field Day with ADT, BIY, DMS, VAI, YOR, MD, AYG, 5HNW, and 4VXD operating. EPE operated 20-meter c.w. on Field Day with the Old Colony Club. QLT says Field Day was the biggest event of the month for the Falmouth Amateur Club. UKO has a new SX-96 receiver. FZU is Radio Officer for Middleboro, and FEC is on the planning board for South Massachusetts. ECK is new in Bridgewater on 10 meters. WN1DXN, new in E. Bridgewater, is on 80-meter c.w. VIII is summering at Hull. The Bedford Radio Club held its Annual Banquet and Ladies' Night. The Winthrop C.D. net had 19 stations on: UOC, CMW, TEO, KWD, NMX, TTH, BDU, DEL, DJ, OIR, DLY, DRP, DUV, HJF, MQB, BB, and DQF. WNIGBI is new in town. TQN graduated from West Point and is home for awhile. A new ham in Wellfleet is WN1FQQ. MPT went to New Jersey on vacation. OSX is home again. TQK had some bad steam burns. RDV and his XYL visited KPN and WNT. Traffic: (June) W1EPE 146, UKO 141, CLF 89, UE 42, AVY 35, TY 22, EMG 21, LM 18, NUP 14, WU 10, BY 7, QLT 6, ZDQ 4, ATX 3. (May) W1AB1, 1. (Apr.) W1AYG 2.

**WESTERN MASSACHUSETTS** — SCM, Osborne R. McKeraghan, W1HRV — SEC: RRX. RM: BVR. PAM: QWJ. The WMI C.W. Net meets on 3550 kc. Mon. through Sat. at 1900 EDT. The WMI Phone Net meets on 3870 kc. Wed. at 1800 EDT. SRM BVR reports the C.W. Net is doing fine in spite of hot weather. A new OPS is DPY. Lenox, Section net certificates went to SRM and ZUU. The Central Mass. Amateur Radio Assn. held its 7th Annual Gabfest. It was a huge success with more than 100 at the banquet. Speakers included UED from Headquarters, Fr. Fitzgerald of Holy Cross College, FCC examiner DLT, and your SCM. Holy Cross College in Worcester has an active radio club with the station call UYY and a membership of about 15. Four are General Class licensees with the rest

# Announcing: The New MORROW MB-560 Transmitter

90 Watt C. W., 60 Watt Phone All Band Companion  
to the MORROW MBR-5 Receiver

MORROW Company engineers take great pride in announcing the new MB-560 Transmitter, their latest addition to the MORROW family of fine amateur equipment. The MB-560 has been painstakingly designed to afford the amateurs a new high in efficiency, versatility and operating convenience in a compact transmitter for fixed or mobile service. Full 90 watt input on C.W. and 60 watts on phone for five amateur bands. Compare the features of this new, easy-to-use, easy-to-install transmitter for mobile and home operation . . . then SWITCH TO MORROW TODAY!

**1. VFO or XTAL** — Extremely stable VFO directly calibrated for 80, 40, 20, 15 and 10 meter bands. Xtal socket and OSC calibrate control on front panel.

**2. ZERO-BEAT CONTROL** — Allows operator to accurately zero-in on incoming signals without turning final amplifier on.

**3. 6146 POWER AMPLIFIER** — Efficient circuit delivers maximum power to antenna. Special two-section tuning capacitor allows band-spreading on 20, 15, and 10 meters.

**4. PI-NETWORK OUTPUT** — Circuit allows matching to wide range of antenna impedance for fixed, portable or mobile operation.

**5. NEGATIVE CLIPPER** — Push-pull Class "AB1" modulators with negative speech clipping for 100% high level modulation.

**6. BUILT-IN RELAYS** — Relays for controlling antenna and receiver silencing are built-in in the MB-560 Transmitter.

**7. FULLY METERED** — All necessary circuits are metered by front panel meter and selector switch.

**8. TUBE LINEUP** — 6146 PA 6AQ5 frequency multiplier, 6CL6 VFO and Xtal OSC, 2 6CU6 modulators, 12AX7 driver, 6AU6 pre-amplifier, 2 OB2 VR's.

**9. POWER REQUIREMENTS** — Operates on 6 or 12 volts. Requires 300-600 volts at 200 ma. and 250 volts at 75 ma. Latter voltage normally supplied by companion MBR-5 Receiver.

**10. SMALL AND SOLID** — Sturdily constructed of heavy aluminum for years of reliable service. Compact: 4" high x 11 $\frac{3}{4}$ " long x 6 $\frac{1}{2}$ " deep.

**11. POWER SUPPLIES** — PWR 6-12 DC exciter power supply \$29.95.

PWR 115X AC power supply for fixed operation for MBR-5 Receiver and MB-560 Transmitter \$29.50.

AC power pack for Receiver and Transmitter complete, available on request.

Interconnecting harness for using the MB-560 Transmitter and MBR-5 Receiver available as an accessory.

**12. AMATEUR NET** — \$189.50 complete with tubes, key and microphone plugs, power cable connectors, and MORROW-MOUNT quick mounting brackets.

Canadian Office: 801 Dominion Bldg.  
Vancouver, B.C., Canada

# NEW for VHF

Operate any frequency in the two meter band! Replace those 8 mc crystals with this compact, easy-to-assemble VFO kit

## JOHNSON TWO METER VFO

Temperature compensated and extremely stable, this compact Two Meter VFO kit is designed to replace 8 mc crystals in most existing two meter transmitters, including types using overtone oscillators. The easy-to-read, edge-lighted lucite dial is calibrated from 144 to 148 mc with 7 to 1 vernier tuning provided . . . output frequency range is 7.995 mc to 8.235 mc and a separate 7.995 to 8.235 mc dial calibration is provided to facilitate calibrating the unit with 8 mc crystals. Power requirements are only 6.3 volts at .3 amp and 250 to 325 volts at 10 ma and may be taken from the transmitter with which the VFO is used. (Power cable and octal power plug are furnished with the unit.) Tube line-up: 6BH6 series tuned oscillator and an OA2 voltage regulator. Dimensions, only 4" x 4½" x 5".

Cat. No. 240-132 Viking Two Meter VFO Kit including complete assembly instructions, tubes and pre-calibrated dial

**\$29.50**

Amateur Net

Cat. No. 240-132-2 Viking Two Meter VFO, wired, calibrated and tested with tubes

**\$46.50**

Novices and Novice trainees. Several rigs include a Navy TBM-10 and a Novice rig. The Club QNIs and has NCS jobs in the Deep Sea Drag Net and TCPN and has piled up 55 countries and WAC on 14 Mc. The Pittsfield Radio Club was very active Field Day with 5 rigs on emergency power, 20 operators, and used 5 bands. HCRA had 5 rigs and seven operators going strong at the same time. Others reporting Field Day activity were UIS, TPH, UUJ, IJL, UEY, and AZW. The Berkshire County Amateur Radio Assn. recently was formed with its first scheduled meeting for September. AZW finally hooked a KA with 25 watts on 14 Mc. UXK, reporting from Formosa, says he will be leaving soon for WI-Land and expects to be operating from his home QTH in Leominster by October. He built a VFO during his spare time and will put it in use when he gets home. TVJ has passed the 1st-class commercial phone exam and has a summer job in a radio station. BYH reports 53 countries worked and he has a new VFO. Traffic: (June) W1BVR 82, TAY 36, ABD 34, HRV 30, WDW 9, BYH 7, WPW 4, DPY 3, TVJ 3, (May) WITVJ 13, AMI 10, WPW 2.

**NEW HAMPSHIRE** — SCM, Harold J. Preble, W1HS — SEC: BXU. RMs: CRW and COC. PAM: CDX. Field Day equipment is packed away for another year. A good time was had by all, as always. The Concord Brasspounders had nine set-ups on Oak Hill and reports more contacts than any previous year. Ask them about the incentive. PFA is building a new QTH at Salem, N. H., and hopes to be in it soon. His tower already is up and has beams for 20, 10, and 2 meters and a ground plane for 6 meters. Looks like an FB set-up. CDX made BPL the hard way in June. NIDYE has passed his General Class examination. ARR received a new mill for a graduation present and is keeping it hot handling traffic. ZIW is knocking off lots of DX on 10 meters. AJF operates from UUY, Holy Cross University, during the school year. GMH reports recent visits from WTG and WTH with families, also SEO and his XYL. RCEN is closed down for the months of July and August. Greetings to Novices N1EMI, N1EMV, N1EMW, N1EMX, N1END, N1ENL, N1ENM, N1ENO, N1ENP, N1ENR, N1EOW, N1EQN, N1FCU, N1FDC, and N1GHW. Traffic: W1ARR 342, CRW 337, CDX 111, IP 74, ZIW 36, SAL 33, COC 30, WNIDYE 23, WICCE 18, HOU 14, GMH 13.

**VERMONT** — SCM, Robert L. Scott, W1RNA — Many of the gang are wondering what happened to the license plate bill. It was "harpooned." Thanks to all the fellows who worked for it and especially to BRG. The issue is not dead as far as we are concerned and next year will bring new endeavors to obtain the plates. The secretary of the BARC reports the following: More than 300 attended the 4th International Field Day and Vermont Hamfest, co-sponsored by the Montreal Amateur Radio Club of Montreal. Hams were present from New Hampshire, Massachusetts, Rhode Island, Connecticut, New York, Vermont, and the Provinces of Quebec, Ontario, and British Columbia. TLI/M was winner of the 10-meter treasure hunt. Speakers were VE2BE, VE2TA, W1UED from ARRL, W1VEB, and W1RNA. A radiogram from the Vermont Green Mountain Net was handled via 80 and 10 meters to President Eisenhower at the Rutland Fair. A very fine letter was received in reply from Press Secretary Haggerty. Traffic: W1AVP 106, OAK 99, CMY 61, BJP 15, KJG 12, RNA 10.

### NORTHWESTERN DIVISION

**ALASKA** — SCM, Dave A. Fulton, K1TAGU — The C.D. Test of June 15th went very well in the Anchorage Area with a good turnout of mobiles as well as a crew at the c.d. headquarters, which handled the situation very well as far as communications were concerned. The mobiles in the Anchorage Area were called upon a second time this month for aid in the Lions Club operation "Little Red Wagon" Telethon. There was a good turnout of mobiles on this operation also, even though it came on the same week end as Field Day. There seems to be quite a bit of interest in the Alaskan DX certificate. Maybe it's a little harder to get than we thought. No. 1 has not been given out as yet, but we do know of one station just waiting for the confirmations to roll in. There were some 15-meter openings to the States from the Anchorage Area in both June and July. How about some news from the rest of the territory?

**IDAHO** — SCM, Alan K. Ross, W1WU — Rupert: CAP operated as portable in the Washington, D. C. Area in June. Gifford: VWS has a 25-w.p.m. Code Proficiency certificate. He needs Delaware, Rhode Island, Vermont, and Maine for WAS and would like schedules. Kellogg: RQG and WHZ had an FB Field Day making 21 contacts with emergency power. Emmett: HOV is the new EC for Emmett and Gem County and reports he has a 75-watt portable and three gas-driven generators available. Boise: 6EBK visited the gang at a "hamburger fry" while passing through. Some of the fellows are acquiring Motorola type 30D f.m. rigs for 2-meter mobile. The Gem State Amateur Radio Club worked a station at two hobby shows in June.

**MONTANA** — SCM, Leslie E. Crouter, W7CT — The Old Faithful Radio Club had a very successful ladies' night with 24 hams and their families attending. Two new hams in the club are WN7ZSR and WN7ZSS. Rigs were set up by FGB for Field Day for the Livingston gang and VMI of-

(Continued on page 90)

# PRECISION

## MODEL ES-520

**A RELIABLE, GENERAL PURPOSE  
High Sensitivity  
5" OSCILLOSCOPE  
WITH PUSH-PULL  
VERTICAL and HORIZONTAL AMPLIFIERS**

*PRECISION*-engineered in response to long and growing demand for a reliable, factory-made, general purpose scope at a price within reach of all to whom initial investment is of extreme importance.

The rugged, dependable ES-520 conforms to every *PRECISION* standard of quality workmanship and performance. It is the ideal oscilloscope for all general communications, electronic and Radio-TV maintenance . . . on the production line . . . in the service shop . . . and in the well-equipped ham shack.

- ★ Push-Pull Vertical Drive. 20 mv/inch deflection sensitivity.
- ★ Input Specifications: 2 Megohms, 22 mmfd.
- ★ 3-Step, Frequency-Compensated, Vertical Input Attenuator.
- ★ Vertical Frequency response 20 cycles to 500 KC within 2 DB.
- ★ Direct Reading Built-in Peak-to-Peak Vertical Voltage Calibrator.
- ★ Excellent Vert. Square Wave Response from 20 cycles to 50 KC.
- ★ Push-Pull Horizontal Drive. 50 mv/inch deflection sensitivity.
- ★ 'H' Freq. response 20 cps to 200 KC within 3 DB (at full gain).
- ★ Internal Linear Sweep 10 cycles to 30 Kc. Negative and positive sweep synchronization.
- ★ Tube Complement: 12AU7 'V' cathode follower and amplifier, 6CA phase-splitter, 12AZ7 push-pull 'H' drive. 6AB4 'H' amplifier, 12AZ7 push-pull 'H' drive. 12AU7 sweep oscillator, 6X4 rectifier, 1V2 high potential rectifier, NE-51 calibration regulator, 5UP1 CR tube.
- ★ Built-in 60 Cycle Sine-Sweep Phasing Control.
- ★ "Z" Axis Modulation Input Terminal for blanking, timing, etc.
- ★ All 4 Deflection Plates Directly Accessible at Rear.
- ★ High Contrast Filter-type, Removable, Calibrated Graph-Screen.
- ★ Fully Licensed under patents of A.T.&T. and R.C.A.

**Model ES-520 Deluxe:** (Illustrated) In custom-styled, blue-grey ripple finished steel cabinet; 2 color satin-brushed aluminum panel and contrasting dark blue control knobs. Case Dimensions 8 1/4 x 14 1/2 x 16 1/2 inches. Complete with all tubes, including 5UP1 CR tube. Comprehensive Instruction Manual.

Net Price: \$132.50

**Model ES-520 Standard:** Electrically Identical to above but in standard black cabinet with black anodized aluminum panel. Case Dimensions 8 1/4 x 14 1/2 x 16 1/2 inches. Complete as above.

Net Price: \$127.50

See the new Model ES-520 at your favorite Electronic Parts Distributor. Ask for new 1955 catalog describing the complete line of *PRECISION* Test Instruments for AM, FM, TV.

fered his ranch as the location for the event. Plans are being made for a picnic with the Gallatin Radio Club for some time in September. FGB and RZY are busy working on plans for simulated emergencies for the coming season. GEF has returned from vacation in W0-Land. YPN is busy converting a pair of BC-375s. WBC is working on modulation equipment so that he can reap full enjoyment of his new General Class ticket. The second Eastern Montana Ham Picnic was held at Wolf Point on June 19th attended by over a hundred, of which 44 were hams. There were 17 mobiles and 1 aero mobile. Thanks to TPE for the report on the picnic. RZY recently moved to Butte and is active on 75 meters. A new ham in Butte is WN7YKN. CDW has a new kw. on 20 and 40 meters. The Butte Club still has copper certificates for those who can show proof of having worked at least six Butte stations. Traffic: (June) W7MQI 28, RYZ 4, (May) W7SFK 25.

**OREGON** — SCM, Edward F. Conyngham, W7ESJ — OO's report many second-harmonic signals outside the 40- and 20-meter bands, but band-edge operation was good. Field Day reports were received from LNG, Camp White on Rouge River; ANG, Cline Falls; SAA, Marys Peak; YYE, Benson Lookout; OTV, Mt. Buxton; KYC, Government Camp; ACY, Manzanita; SBT, Agate Desert; and RKP, Dodge Hill. This was an excellent turnout for Oregon. WAT will be QRL with school and work daytime and evenings but on Sundays will be on 40 meters. WHE moved to a new QTH and is rebuilding. AJN has trouble and is rebuilding. WLL ditto. APF believes the new final will solve the TVI difficulty. UJL is off on a camping trip. NFZ ran a test from City Park, Grants Pass, with mobiles in Medford and Ashland. UZU is building a new antenna system. LI and SEZ are starting up 2-meter MARS. VBF slowed down because of summer work. PRA is QRL OSN and RN7 but is building 2-meter equipment. PQJ is going strong with RTTY. SAR is wiring up a new Heathkit DX-100. RER has the kinks out of the new mobile. OJA, VIL, BEG, ISP, DIE, EZR, EXF, LNG, VPH, and ULR have a hot AREC and MARS project going on 10 meters. JRU, ABW, VDG, SBX, SBU, and UHC have the same thing going on 160 meters. Traffic: W7APF 92, PRA 78, WAT 50, THX 30, BLN 20, ESJ 12, UJL 9, LT 7.

**WASHINGTON** — SCM, Victor S. Gish, W7FIX — Nets: WARTS, 3970 kc., 1800 PST Mon. through Sat.; WSN, 3575 kc., 1900 PST Mon. through Fri. JPH is at school in Minneapolis. VAZ is using a Viking but building an 813 rig for traffic. FRU had antenna trouble but is back on the nets again. K7WAT reports the Fort Lewis Amateur Radio Club has been formed with KUS as its first president. RCM, your SEC, is doing a swell job despite illness in the family. APS is doing most of his trafficking on RN7. UIN is a new OPS in Tacoma. WQD is a new OBS in Port Angeles with nightly skeds on 3940 kc. at 1930 PST. EVW and APS renewed appointments as OPS and ORS. LVB now is on the air with 210 watts. AIB and CWN were on Field Day with the West Seattle gang. PQT is busy on MARS and WSN. UYL changed her QTH but is back on the air again. EHH took his 100-watt portable on a vacation trip to New Jersey. HDT, YBV, and WN6KDJ/7 worked Field Day in the rain. FZB was on Field Day from Bainbridge Island. BMK is reinstalling mobile. AVM has a 2-meter beam up but still is having trouble hearing others. UQY reports the Richland gang is on summer routine. YJE contacted seven sections on 6 meters in the V.H.F. Contest. The Seattle Wireless Association now is ARRL-affiliated. PVZ is keeping regular skeds over the Cascades from Olympia to Yakima and Toppish on 144 Mc. The Puyallup Club (IYU) reports: TGO was on the TV program "You Asked for It"; OEB still is expanding the house; on Field Day EHH, IYU, and MTX were on 75-meter; phone; HMQ and XYL, WHV, on 2 meters; MPH mobile Lake Washington; VLC and RMI are antenna experts. BA spent two weeks in W6-Land and visited W6NCP. He now is contemplating overhaul of the beam for better signals. Traffic: W7PGY 1106, BA 1102, VAZ 715, FRU 170, K7WAT 149, K6BDF/7 87, W7RCM 64, USO 50, APS 40, RXH 33, UIN 29, LVB 28, AIB 25, TGO 20, PQT 15, UYL 13, EHH 7, HDT 6, WQD 6, EVW 5, FZB 5, AVM 2, BMK 2, CWN 2.

## PACIFIC DIVISION

**NEVADA** — SCM, Ray T. Warner, W7JU — SEC: WVQ. ECs: PEW, PRM, TVF, TJJ, and ZT. OPSs: JUO and UPS. ORSs: MVP, PEW, and VIU. OBS: BVZ. Nevada State frequencies: Phone 3880 and 7268 kc.; c.w. 3660 and 7110 kc. YKC, of Las Vegas, is enjoying his new DX-100. 6ABN, operating portable in Las Vegas, hit an FB opening on 6 meters July 3rd, giving many stations in the southwest their first Nevada on this band. JUO completed his all-band mobile in time for a Colorado vacation jaunt. KIO now is active with a Viking II. 6JYN received an endorsed certificate for 50 Nevada QSOs. THH and VIQ received certificates for 25 Nevada QSLs. The Mobiliers, operating YN, were active on 2, 20, 40, and 80 meters at the Reno Hobby Show. The Southern Nevada Amateur Radio Club had a station operating from Helldorado Village during the recent celebration there. QGE, of Reno, now

(Continued on page 92)

# THE CASE OF THE BANTAM

There is indeed such a case but there's nothing mysterious about it. This case contains the high "Q" coil assemblies, the "Heart" of the widely acclaimed, 15 and 20 meter Gonset Bantam Beams.

No flimsy, crushable cardboard here. Instead, a sturdy wooden case with interior supports to which the assemblies are firmly secured by wood screws. With this case, "Pre-tuned at the factory" remains a valid claim even after the inevitable shocks and jars of shipment. This exceptional Gonset packaging entails no extra cost to you, is absorbed in a selling price that would still offer full and excellent value if the assemblies were merely wrapped in paper! Just one of the many reasons why you should make your choice a "BANTAM".

## Features

*Performance in all kinds of weather*  
approaching that of a full-length 20 meter array.

EXTREMELY COMPACT . . . ONLY 16½ FEET,  
TIP-TO-TIP . . . . .

LIGHT IN WEIGHT . . . ONLY 27 POUNDS

EASILY ROTATED BY TV-TYPE ROTATOR

EXCELLENT FRONT-TO-BACK RATIO . . .

RACINE, WISCONSIN

is driving his 610 with a Ranger, ZT, RSY, and JU took in the Pacific Division Convention in Fresno.

**SANTA CLARA VALLEY** — SCM, R. Paul Tibbs, W6WGO — SEC: NVO. Asst. SCM: Roy E. Pinkham, 6BPT. K6BBD reports that a 33-ft. vertical antenna works very FB on 40 meters. Dick is looking for a Delaware contact for WAS. EXX's 50-Mc. rig is finished; now for the antenna. He worked 40 meters on Field Day for the PAARA and at Region Three headquarters during Operation Alert. WLI worked Field Day at AEX/6 near Saratoga. ZRJ rebuilt his receiver and made changes in his antenna as per George Grammer's dope passed to Doc at the Fresno Convention. K6GID is the new manager of NCN, replacing EFD, who resigned to take up schedules with Pacific stations for traffic work. GIL is planning on recruiting new stations for NCN. He would like all those stations in Northern California who can work c.w. on 3635 kc. to check into the net every night at 2000 hours PDST. Net sessions are not long and will not take much time from your activities. How about you boys who want to work with some real considerate operators? Speed is not fast. KN6JJG would like to start a net on 40 meters for Novice operators. Competition was very keen in the Section on Field Day. Most of the clubs had stations in the field and topnotch operators manning them. KIN has finished a three-element beam for 14 Mc. using inductive coupling. Al uses a Balun made from coax line to step up from 75-ohm line to 300 at the coupling rings. Traffic: (June) W6HC 145, ZRJ 144, FON 105, K6GID 88, W6AIT 39, K6BBD 29, KN6JJG 4, K6BAM 1. (May) K6GID 64, W6EXX 29.

**SAN FRANCISCO** — SCM, Walter A. Buckley, W6GGC — Asst. SCM: William T. Nakahara, 6GHL, KKM, secretary, reports new members of the Marin Amateur Radio Club are CXU, WNJ, K6KNX, W6WQI, and W7WND/6. LUM souped up his set and now has TVI. DXA is active on 2 meters. KKM operates 40-meter 'phone with 30 watts and received answers from K4s, KL7s, and KH6s. ZNT/6 now is at his new QTH in Mill Valley. TIJ recently retired after 40 years and he now expects to put lots of time into hamming. The Club will not hold any meetings until Sept. 9th. GQY will be QRL for a few months with the Youth Recreation Program. SLX reports that he is very busy helping some of the youths in Eureka to get their tickets. KN6HIW, KN6IKQ, and W6QMO attended the YLRL Convention. Jeri spent a week in Los Angeles visiting friends. WB was guest speaker for the San Francisco Club in June. He has monthly articles in Elmer's Tech News. The fellows enjoyed his talk on "New Ideas for Less Noise and Power Leaks in Receivers." KFS made his first out-of-state contact on 6 meters; he contacted FKY in Colorado. URA says openings on 6 meters have been very frequent lately. KFS and GGC were the hidden transmitter for the 29ers in June. K6ANP, who won the hunt, is now in Uncle Sam's Navy. The HAMS and the San Francisco Naval Shipyard joined ranks high on Mt. Davidson for Field Day. ARRL officials participating were NL, EC; UOQ, SEC: JWF, trustee of Red Cross communications; GGC, SCM. GHI did all the cooking for the boys and they were well fed. BIP and CTH were chairman and co-chairman for the San Francisco Radio Club. The Sonoma County Radio Club will hold its picnic at Sebastopol in September. Joan Neiman passed her Novice Class exam but has not yet received her call. GGV, of Stanford Research Lab., gave an interesting talk and demonstration on 2-meter c.d. and mobile transmitters to the boys at the San Francisco Naval Shipyard meeting. HJP was back in the San Francisco Area prior to departing for Okinawa with the U. S. Air Force. The bill for license plates for mobiles in California was OKed at this session of the legislature but at this writing has not been signed into law. GCV and PCN are settled in their new QTH. PHT did a grand job collecting prizes for the Mission Trail Roundup held at El Verano. All attending reported a wonderful week end. KZF has been reappointed as EC for MTN. LOU is now at his new QTH. OPL, as usual, came through with a large donation of hot dogs and salad for the Roundup. RBQ was not well enough to participate in Field Day but donated the use of two of his big trucks. Sorry to have to list as a Silent Key, K6ABE, who drowned in the Russian River June 18th. Traffic: W6GQY 131, GGC 64, PHT 55, GHI 12.

**SACRAMENTO VALLEY** — SCM, Harold L. Lucero, W6JDN — Field Day has come and gone and all clubs report a wonderful time. ASI just completed linear amplifier with 4-400As for his s.s.b. AK has gone s.s.b. with a 20A for an exciter and has a new 75-A4 and all the trimmings. ZF also has a 20A exciter for his s.s.b. GTG is active on 75 meters. DTW has a new Mini-beam for 20 meters. HSB and HTS are doing experimental work with antennas and are quite active on c.d. and 20-meter 'phone. GDO moved to Fair Oaks and is active on 75-meter mobile. GQS is active on 75-meter mobile and has a "Gallon" on 75 meters. MIW has a new Viking Ranger for all bands, but still is faithful to 144 Mc. PIW has gone completely 144 Mc. but says he still isn't convinced that 'phone is doing away with c.w. on the lower frequencies. VBQ moved to Stockton. HSV moved to North Sacramento. JIJ is active on 75-meter mobile. QDT reports in from the San Joaquin Valley section that he is back on the air in his new QTH, 1063 Paradise Road, Modesto. At present Tony is on 75 meters. QYQ is

# NEW MULTIPHASE "Q" MULTIPLIER

- Peaks Desired Fone or CW Signal
- Nulls Out Interfering Carrier up to 50 DB.
- No Loss in Speech Intelligibility

- No Insertion Loss — New Two Tube Circuit
- Special High "Q" Pot Core Inductor

**MODEL  
AQ**

**MODEL DQ**

**MODEL  
B  
SLICER**

## CONVERTS MODEL A SLICER

Plugs into Model A accessory socket, converting it into a Model B. New front panel and controls provided. Enjoy all the advantages of "Q" Multiplier selectivity on CW, AM & SSB with your present Model A Slicer.

Wired.....\$29.50  
Kit.....\$22.50

## FOR AM, CW, SSB OPS

Desk Model "Q" Multiplier for use with any receiver having 450 to 500 KC IF. In attractive, compact case with connecting power-IF cable. Power supplied by receiver. Also provides added selectivity and BFO for mobile SSB or CW reception.

Wired.....\$29.50  
Kit.....\$22.50

## BUILT-IN "Q" MULTIPLIER

Upper or lower sideband reception of SSB, AM, PM & CW. For use with any receiver having 450-500 KC IF.

Wired.....\$99.50  
Kit.....\$69.50

## MODEL A SLICER

Same as Model B but less "Q" Multiplier  
Wired.....\$74.50  
Kit.....\$49.50

## A NEW CONCEPT IN LINEARS

## MULTIPHASE 600L

## BROAD BAND LINEAR AMPLIFIER

## NO TUNING CONTROLS!

## SINGLE KNOB BANDSWITCHING 10-160 METERS

- Single 813 in Class AB<sub>2</sub>. Approx. 2 watts effective or 4 watts peak drive for 500 watts DC input.
- New band-pass couplers provide high linear efficiency: 60-65%.
- Designed for 50-70 ohm coaxial input and output.
- Built-in power supply. Bias and screen regulation. Automatic relay protection.
- Exclusive metering circuit reads grid current,

watts input, RF output, reflected power from mismatched load — switch to any position while on the air!

- Completely shielded — TVI suppressed. Free of parasitics! Low intermodulation distortion.
- Choice of grey table model (17 $\frac{5}{8}$ " W, 8 $\frac{3}{4}$ " H, 13" D) or grey or black rack model.

Wired, with tubes.....\$349.50

**MODEL 20A**

## MULTIPHASE EXCITERS

### Check These Features

### NOW IN BOTH MODELS

- 20 Watts P.E.P. Output SSB, AM, PM and CW
- Bandswitched 160 — 10 Meters
- Magic Eye Carrier Null and Peak Modulation Indicator

Choice of grey table model, grey or black wrinkle finish rack model.  
Wired and tested.....\$249.50  
Complete kit.....\$199.50

- Perfected Voice-Controlled Break-in on SSB, AM, PM.
- Upper or Lower Sideband at the flip of a switch, with 40 DB. suppression.
- New Carrier Level Control. Insert any amount of carrier without disturbing carrier suppression adjustments.
- Talk yourself on frequency.
- Calibrate signal level adjustable from zero to full output.
- New AF Input Jack. For oscillator or phone patch.
- CW Break-in Operation.
- Accessory Power Socket.

**MODEL 10B**

- 10 Watts P.E.P. Output SSB, AM, PM and CW.
- Multiband Operation using plug-in coils.

Choice of grey table model, grey or black wrinkle finish rack model. With coils for one band.  
Wired and tested.....\$179.50  
Complete kit.....\$129.50

# QST

## ADVERTISERS

“Advertising is accepted only from firms who, in the publisher’s opinion, are of established integrity and whose products secure the approval of the technical staff of the American Radio Relay League.”

Quoted from QST’s advertising rate card.

**Amateurs and Electronic Engineers: Practically everything you need can be supplied by the advertisers in QST. And you will know the product has the approval of the League’s technical staff**

active on MARS nets. TYC is now with the telephone company, Sacramento, and is active in c.d. work at Carmichael. UM is active in c.d. AIN would appreciate some “needling” to get back on the air. Come on, Hank, after 35 years you shouldn’t need needling to get back on. K6BWC and his new XYL are honeymooning. QV1 is on RTTY. ICO lost his entire mobile whip. K6BYS is mobile on 160 meters. IZC moved to a new QTH. MWR has mobile installed in the pickup. Traffic: W6ZF 7, JDN 6, DWTW 2, GTG 2, K6KHE 1.

**SAN JOAQUIN VALLEY**—Acting SCM, Edward L. Bewley, W6GIW—SEC: EBL. RM: K6EVM. JPU, Ralph Saroyan, was nominated as SCM, and as his was the only name submitted he automatically becomes unanimously elected. Ralph is the EC in Fresno County, and has proved himself as a hard and conscientious worker for the good of his fellow hams. I feel sure that a better choice could not have been made and hope the gang will give Ralph the same splendid cooperation that I received during my term of office. Field Day once more was the main event of June. From the reports received here, it was equal to or better than last year. I received five Field Day messages, which is the most yet, indicating the section was well represented. FEA and WJF have moved to the Bay Area, but as yet have no permanent address. FEA attended the YLRL National Convention in Santa Monica. Gertie is the sixth district chairman. EBL reports his Heathkit DX-100 is an FB rig. According to most reports received the June c.d. alert drill was a success. It was the first in Stanislaus County to use ham radio, and many c.d. officials were surprised to find ham radio so efficient. The CVRC Picnic was a success and all who attended enjoyed themselves. Maybe it will be an annual event. Traffic: W6TTX 517, ADB 80, K6EVM 56, W6EBL 37, K6BMM 5, W6FEA 5, GIW 5, WJF 3.

### ROANOKE DIVISION

**NORTH CAROLINA**—SCM, Charles H. Brydges, W4WXZ—SEC: ZG. RM: VHH. PAM: ONM. The Piedmont Amateur Radio Club is active in Salisbury with a new air-conditioned shack. The club station, EXU, is on with a kw. EYZ did a fine job as NCS of the Tarheel Net during June. JZQ is new EC for several counties in the eastern part of the State. New Novices in the Charlotte Area are KN4DRV, KN4DHM, and KN4DWL. Two meters still is in the picture. RRH heard CVQ and is looking for a Charlotte station. HYT is now General Class and will be on 80, 75, and 40 meters with 100 watts. The Tarnetto Club operated SOD/4 on Field Day from a 40-ft. observation tower. HLY/4 was at Cowhee Bald, MOE/4 at Elke Mountain, NC/4 at Tanglewood Forest, and OXQ/4 at Rankin Lake. Two new YLs in Salisbury are KN4DTL and KN4DTC. ZG is moving to a new temporary QTH. Welcome to HIF from Atlanta and now in Fayetteville. Get all the publicity on ham radio you can in your local papers; it will let the public know how we work. The Forest City Hamfest was a big success. If you want to join the AREC (Amateur Radio Emergency Corps) please drop me a line requesting application forms. GHS is moving to Charlotte. The Greensboro Radio Club Field Day netted 596 contacts. One 30-watt and two 100-watt rigs were used. The Greensboro 2-meter Net still meets on 146.88 on Thurs. at 8 p.m. SGD reports the Tarheel Emergency Net now has very good participation. Even though 3865 kc. is our net frequency, fixed stations should not remain on the frequency all of the time. Mobile stations would like to work also. When you have a sked on the net frequency move off the net frequency when the contact is made and give mobile stations a chance. This idea came from many of the fellows throughout the State. Traffic: W4RRJ 50, GHS 11, ACY 7, BUA 6, SOD 5, BUW 3.

**SOUTH CAROLINA**—SCM, T. Hunter Wood, W4-ANK—HIDR has received the BPL Medallion from the ARRL as an award for making Brass Pounders League three times. The striking feature of this achievement is that it was all accomplished on ‘phone and he is the first South Carolina amateur to receive this award for traffic-handling. LXX was on 40-meter c.w. in the CD Contest and reports from the Florence group that VAM is completing a kw. rig and has a new 20-meter beam. SMI is on 75-meter ‘phone with 12 watts using Heising modulation and receiving good reports. ZUV reports working a VK on 40-meter ‘phone and is active on 75-meter mobile. ULH is building a new 500-watt handswitching final using 250THs. TSU is completing a kw. s.s.b./a.m./c.w. rig. AUL expects to be on 20-meter c.w. soon with his 500-watter. FXG is on 40-meter c.w. and plans to work 20-meter c.w. for DX. LLH is on 20-meter ‘phone and is planning a new antenna. Field Day activity within the State was high this year with more club groups participating than in previous years. The C.W. Net operates on 3795 kc. at 7 p.m. weekdays. Traffic: W4HIDR 162, ZIZ 137, FFH 103, ANK 59, FML 16.

**VIRGINIA**—SCM, John Carl Morgan, W4KX—SEC: RTV. This year showed a new high in Field Day activity, both by clubs and individual groups. BLR produced a new tax exemption for OM BVB. New VFN Mgr. YVG tried a new call-up system, but the majority voted preference for the old method so he went back to that after

(Continued on page 96)

# MALLORY HAM BULLETIN

## You'll like every feature of the New MALLORY VIBRAPACK® Power Supply

Designing a battery-operated mobile rig? For the power supply, take a look at the features that are built into the new Mallory Vibrapack.

**HEFT IT**—the Vibrapack fits easily into the palm of your hand. It's less than 5½ inches in its longest dimension.

**CHECK ITS WEIGHT**—it's barely 4 pounds.

**LOOK INSIDE**—its sturdy steel cover and bottom plate snap off quickly, without need for struggling with screws or complicated fasteners.

**SEPARATE TAP** for the rectifier filament assures instant restart after stand-by.

**HOOK IT UP**—there is a model for 6, 12 or 24 volt operation.

**LOAD IT DOWN**—each model is conservatively rated to deliver the power you need at high efficiency and with minimum battery drain. One model has taps for either 210 or 260 VDC at 60 MA; another has an output of 325 VDC at 100 MA. Both ratings apply when used with rated input voltage, and working into a minimum of 10 MFD input capacitance.

**TRY** it with a sensitive receiver. Its built-in wide range input and output RF filters provide hash-free performance.

**LISTEN** to its quiet operation. Mechanical hum is reduced practically to zero in the new Mallory Vibrator used in the Vibrapack.

**ASK** any police radio engineer about the long life and dependability of its series-drive, heavy-duty communications vibrator . . . the same components used in police, taxi and utility 2-way mobile gear everywhere.

Designed for the economy minded amateur or commercial engineer, the new Vibrapack gives you a lot of performance at modest cost. Its ruggedness and dependability are based on principles developed by Mallory during more than 25 years of building vibrator power supplies for communications equipment.

See your local Mallory distributor for a first-hand look at this new line of power supplies. If you'd like written data, just drop us a letter.

# Kuehne

A Tower of Strength  
for your  
MINIATURE BEAM

## FREE-STANDING TO 50 FT.

Safe in 80 mph winds without ugly, hazardous guy wires (something the XYL will like). Install a Kuehne tower yourself on roof or ground. It goes up quickly, easily, at low cost. Tested and proved for miniature arrays. Accommodates 1½" mast and rotor. Built of 16 ga. cold-rolled steel sections reinforced with steel gird-around ties spaced 12" apart. Zinc electro-plated finish. Cadmium-plated connecting hardware. Assembly blueprints furnished upon request of purchaser. One year parts guarantee. Order from your Kuehne Distributor. If none nearby, we will ship to your door.

## Exclusive LATERAL LOAD BEARERS

Note (Y) how bolt connects through load bearers life-time welded to side of each section leg with twin 1½" fillets. No holes in or load on joints. No horizontal bolts to tear through. Nothing stronger. Only Kuehne has it! Arrow (X) shows ventilated open joint for free moisture drainage.

No Load on Joints!

(Patent Pending)

## GIRD-AROUND CROSS TIES

Longer, stronger welds grip around OUTSIDE of vertical tubing. This heavy steel tie takes all the outward strain. None is transmitted to tower. More steel! No ripping!

Originated by Kuehne

Specify  
"KEE NEE"

and be sure!

or write direct for  
Complete Information

**KUEHNE MFG. CO.**  
ANTENNA TOWER DIVISION  
MATTOON, ILLINOIS

two weeks. VN is continuing its full schedule during the summer, but Manager PXA says QRN is plentiful and traffic isn't. 3DWP, of K4MC, is donning double harness. Don says the XYL-to-be can expect a new rig (harm) for a wedding present. Ardent contester JIJ was Virginia winner in the Vermont QSO Party, and placed third in the YL/OM fracas. IA/TFX and menage moved to Warrenton. YZC/YE/KN4CAX say the new QTH looks good. One Field Day note came from BYZ, who says he and EGA went to White Oak Mt. Result — no contact, ten chigger bites. That's starting from scratch, eh? K4NCP, at Dam Neck now has 5 General and one Novice Class operators. KFC worked KC6CG for No. 228. BZE has the neighborhood wrapped in wire, judging from his reports of antenna experiments. IF says KRR is back in Portsmouth and KN4CQZ is out of the Navy and has returned to Indiana. PFC BPLed again. K4ASU is promoting ham radio among fellow instructors at the Navy Radio School and is readying the school club station. Note to all net stations, if you feel you rate a certificate drop the SCM a card. He may be assuming you already have one. Remember the Virginia QSO Party Sunday Sept. 11th at 0800-2000. Details elsewhere in this issue. Hope C U all. Traffic: W4PFC 890, K4ASU 215, W4BLR 174, K4MC 164, W4CGE 157, WDZ 58, YZC 56, CFV 47, YKCB 37, AAD 35, YVG 24, TVO 20, BYZ 11, TFX 10, TYC 9, SIE 8, KFC 6, K4NCP 6, W4BZE 4, IF 4.

## 1955 VIRGINIA SECTION QSO PARTY

Sunday, September 11th

A QSO Party, open to all Virginia hams, will be held between the hours of 8:00 A.M. and 8:00 P.M. EST on September 11, 1955. Any band or mode may be used, but only one QSO per station per band (except for mobiles) is allowed.

Information to be exchanged consists of Number of QSO, RS or RST report, County in Virginia, and operator's "handle." Example: W4YYY, working W4XXX for his tenth contest QSO, sends him "NR 10 W4YYY 599 CLARKE (COUNTY) IGNATZ." W4XXX then sends a similar message in return.

Scoring: Between General Class or higher licensees, score 1 point for each message sent and for each received, or a maximum of 2 points per contact. For each message sent and received where at least one end of the QSO is a Novice (i.e. Novice to Novice, or Novice to higher class licensee), score 5 points, or a maximum of 10 points per contact. Multiply total number of contact points by the number of different stations worked, and multiply that in turn by the number of different counties, to determine final score.

Call "CQ VA" on c.w. and "CQ Virginia Section Party" on 'phone. General or higher class licensees should call "CQ VA WN" to indicate they intend to listen within the appropriate Novice sub-band. Novices should listen outside the nearest sub-band limit for calls from higher class licensees.

Mobiles operating in more than one county may be worked once in each different county by a fixed station. Similarly, a mobile operating in more than one county may count the same fixed station as another contact from each new county.

Good rallying points include the Virginia Net frequencies, 3680 and 3835 kc.

Abstracts of logs should be mailed to SCM W4KX not later than October 1, 1955.

**WEST VIRGINIA** — SCM, Albert H. Hix, W8PQQ — SEC: GEP, PAM: GCZ, RMs: DFC, GBF, HZA, and JWX. I would like to take this opportunity to announce that GEP is the new SEC. It is requested that the ECs put on a drive to obtain greater AREC membership. Cooperation on the part of hams registering for the AREC will be appreciated by all concerned. The Naval Research Radio Club of Washington, D. C., operated Field Day at Raven Rock, W. Va., with 6 rigs. Several clubs were active in Field Day this year. GBF and PZT again are to be congratulated on their excellent frequency measurement results in the recent Test. OIC is putting up a 1250-ft. long wire. IWB has a new Ranger. CLX now is s.s.b. GCN is doing a bang-up job on s.s.b. NLT has a 40-ft. tower and will have a new beam soon. A Johnson KW, exciter, and auxiliaries have been purchased by the State for installation in the Capitol Building. This equipment is for RACES; however, it also will be used on the ham bands. A special room is being made available for it. CKW and AII were home recently. PNR is building a new kw. rig. 4ALR, of Louisville, visited PQQ recently. Fellows, please send in more activities information. UYR is ORS. N8VMM is active in Sinks Grove. JGI works 14-Mc. c.w. Traffic: W8HZA 60, GEP 19, PZT 12, PQQ 7. (Continued on page 98)

## MODULATION

## TRANSFORMERS

These multi-tapped Stancor transformers will match all common impedances of Class "B" modulators to Class "C" load impedances of 2,000 to 20,000 ohms. With these versatile units in your rig you can change transmitting tubes or operating characteristics without having to invest in a new modulation transformer.

## PINT-SIZED POWERHOUSE!

Here is Penta's new PL-6549 beam pentode, a compact power package which is daily finding new applications where reliability, high efficiency at low and medium voltages, low driving power, and excellent linearity are required.

For r-f output of 50 to 250 watts, or audio output up to 325 watts, the PL-6549 outclasses all other transmitting-type tubes. The beam pentode construction improves linearity—provides distortion-free high peak power output in audio or linear r-f amplifier service.

### RATINGS

SANTA BARBARA, CALIF.

## ROCKY MOUNTAIN DIVISION

**COLORADO**—SCM, Karl Brueggman, W0CDX—This month's report was written by KQD. Stations earning Section Net certificates on CSSN since last December are K0ANZ, W0TVI, W0PGN, K0WBB, W0KQD, and W0TUT. CSSN is taking a vacation from July 1st to Oct. 1st. During this year's Operation Alert all ten Mutual Aid Areas were represented for the first time on the State RACES Net. State Radio Officer WIR had activities at state level very well organized. HNN had a picnic at Salida on June 5th attended by 44. The Sky Hi Radio Club has 3 clergymen among its members, also 2 new licensees, W0XQ and KN0AXC. K0WBB missed BPL for the first time in 7 months. KN0BUL is a new licensee in Salida. MYX is on with 100 watts, 'phone and c.w., at the home station now. OGO is a new HNN member. KHQ hopes to be on the air soon with a Viking II. K0ANZ has gone home to California for the summer. PBN is returning to California where he will be stationed at Hamilton AFB. PGN serves as net reporter for CSSN and LNH for HNN. MFF has graduated from 7 watts to 70 watts. About 35 people attended the hamfest at Estes Park on June 18-19. IA reports that 9 Boulder operators participated in Field Day activities with one 30-watt transmitter and made 162 contacts. NVX checked into HNN as K0WAR from Ft. Carson while on two weeks duty there. IUF is moving to Denver. YNC now is living in Woodland Park. WFR won the mobile station offered as pre-registration prize at the Albuquerque Hamfest. AGU operated mobile and DRY portable for several days at Beaver Creek camp. Traffic: (June) K0WBB 365, W0KQD 274, K0FAM 127, W0PGN 67, NVX 32, TVB 32, EKQ 31, BEN 27, YMP 21, NVU 19, UNM 10, HOP 9, YNC 9, IA 7, SWK 4, OMN 3, UMS 3, LEK 2, SKK 2, OGO 1. (May) W0NVU 194. (Mar.) W0YNC 118.

**UTAH**—SCM, Floyd L. Hinshaw, W7UTM—Summeritis has hit the Utah section! Everyone seems to be on "vacation" as far as news items are concerned. SAZ says Eric has received his Novice call, WN7AAN, after a long wait. OOK has been appointed liaison station on the MARS Governor-to-Commanding-General Sixth Region for emergencies. LQE and VTJ were mainstays on c.w. for the Ogden Club at Snow Basin. RQT had his kw. 'phone rig out for Field Day also at Snow Basin. The Ogden Club was the only Field Day group to forward the SCM message this year. Traffic: W7UTM 2.

**WYOMING**—SCM, Wallace J. Ritter, W7PKX—WNA has moved to Rapid City, S. D. IJW will become new club president. A CAP unit is being organized at Newcastle. HDS reports several new Novices at Cheyenne, and a new operator for the MARS station. There was not much activity on Field Day in Wyoming with only PSO operating portable. The Wyoming section did very well in the c.d. alert Lemon Juice even though no RACES set-up was in operation. All c.d. traffic handled had prompt replies with one exception. HDS and UZP are holding down the Pony Express frequency during the daytime and did a bang-up job. Traffic: W7PKX 86, HDS 76, MNW 21, PAV 16, YSF 8.

## SOUTHEASTERN DIVISION

**ALABAMA**—SCM, Joe A. Shannon, W4MI—SEC: TKL RM: KIX. PAM: WOG. New officers of the Birmingham Club are UEI, pres.; HVH, 1st vice-pres.; BMV, 2nd vice-pres.; KNW, secy.-treas.; YEP, rec. secy. WOG still is chasing DX and coming up with some good ones; he also participated with the Tuscaloosa Club in Field Day. DTT, TWK, and K4AOZ are feverishly working on mobile installations. The Huntsville Club now has a club call, K4DTV, with IHH as custodian. ZSH has moved and is now located two blocks from VLY. CAH took third place in mobile transmitter hunts at both the Pensacola Fest and the St. Petersburg Convention. USM has the Lyseo 600 going at Auburn and is regularly on AENB. KN4CWE is new in Carbon Hill and is giving a Globe Trotter a good workout. DGN is heard on 75 meters occasionally from Decatur. K4AOZ-K4APF are blasting a hole on all bands with the newly-acquired Globe King, and planning an emergency power plant. EBD reports a total of 188 call-ins on AENK during June with three new mobiles, WLM, EFF, and K4CYB. ZSQ has the 20-meter beam up and has acquired a Super Pro. PRS reports good hunting on 2 meters. GOL has a new jr. operator, Nancy Carol. VDK and VDL are listening on a new 75A-3. Traffic: (June) W4HKK 180, YRO 78, WOG 70, KIX 65, DTT 35, ZSQ 27, TKL 26, ZSH 21, QAO 14, CAH 11, EJZ 10, MH 9, TXO 9, EVO 4, TWK 2, USM 2. (May) W4OAO 29.

**EASTERN FLORIDA**—SCM, John W. Hollister, jr., W4FWZ—Looks like June Field Day went over in a big, big way. Radiograms were received from K4DPZ, K4NRC, K4ANW, W4DU, NEK, NVU, PLB, YI, YKY, and ZBA. As usual, Jacksonville and Miami had big turnouts. An excellent report from IYT reflected results of careful planning. Daytona: FSS uses a T-90 and says that AYD is portable in Okeechee (June) and also FEL has returned from near WSM! Lake City: Realizing that his city had no amateurs YNM obtained a ticket and in a year coached more than 14 fellows. His AREC has 13 members. That

(Continued on page 100)

**HOW TO ORDER:** In order to give the fastest possible service, crystals and oscillators are sold direct. Where cash accompanies the order, International will prepay the postage; otherwise, shipment will be made C. O. D.

# FO-1 PRINTED CIRCUIT OSCILLATOR

For Generating Spot Frequency Signals with Guaranteed Tolerance  
1000 KC to 15,000 KC fundamental operation

Since the operating tolerance of a crystal is greatly affected by the associated operating circuit, the use of the FO-1 Oscillator in conjunction with the FX-1 Crystal will guarantee close tolerance operation. Tolerances as close as .001 percent can be obtained.

- FO-1 —Oscillator Kit (less tube and crystal)..... \$3.95
- FO-1A —Oscillator, factory wired and tested with tube (less crystal) ..... \$6.95

## FX-1 CRYSTAL Companion to the FO-1 Oscillator

The FX-1 Crystal is designed for use only with the FO-1 Oscillator. For tolerances of .01 % and .005 %, any FX-1 Crystal can be used with any FO-1 Oscillator.

For tolerances closer than .005 % the oscillator and crystal must be purchased together. The oscillator is factory wired, and the crystal custom calibrated for the specific oscillator.

FX-1

Tolerance	1000-1499 KC	1500-1999 KC	2000-9999 KC	10,000-15,000 KC
FX-1 .01%	\$5.25	\$3.75	\$2.50	\$3.25
FX-1 .005%	\$6.00	\$4.50	\$3.00	\$4.30
{.0025% and .001% tolerances are available only by purchasing the FO-1 Oscillator and Crystal together}				
FX-1 .0025%	\$6.75*	\$5.25*	\$3.75*	\$4.75*
FX-1 .001%	\$8.00*	\$6.50*	\$5.00*	\$6.00*

\*Prices are for crystal only. To insure this tolerance crystal must be purchased with oscillator factory wired and tested. For total price add \$6.95 to price of crystal desired.

## ONE-DAY PROCESSING FA-9

Spot Frequencies 1500 KC to 75 MC .01 %

**.01 % TOLERANCE**—Crystals are all of the plated, hermetically sealed type and calibrated to .01 % or better of the specified frequency. See specifications below:

**Holders:** Metal, hermetically sealed, available in .093 dia. pins (FA-9) or .050 dia. pins (FA-5).  
**Calibration Tolerance:** ±.01% of nominal at 30° C.  
**Temperature Range:** -40° C to +70° C.

**Tolerance over temperature range** from frequency at 30° C ±.01 %.  
**Circuit:** Designed to operate into a load capacitance of 32 mmf on the fundamental between 2000 KC and 15 MC. Designed to operate at anti-resonance on overtone modes into a grid circuit without additional capacitance load. Write for recommended circuits.  
Orders for less than five crystals will be processed and shipped in one working day.

## PRICES FA-9\* (Pin Diameter .093) \*

PIN Spacing .486 (*FA-9 fits same socket as FT-243)	RANGE	TOLERANCE	PRICE
Fundamental Crystals			
	1500-1799 KC	.01%	\$4.50
	1800-1999 KC	.01%	\$3.90
	2000-9999 KC	.01%	\$2.80
	10000-15000 KC	.01%	\$3.90
Overtone Crystals			
(for 3rd overtone operation)			
	15 MC—29.99 MC	.01%	\$2.80
	30 MC—54 MC	.01%	\$3.90
(for 5th overtone operation)			
	55 MC—75 MC	.01%	\$4.50

## For Commercial Use F-6 Series 1000KC to 60MC

Wire mounted, plated crystals, for use in commercial equipment where close tolerances must be observed. All units are calibrated for the specific load presented by equipment.

**Holders:** Metal, hermetically sealed.  
**Calibration Tolerance:** ±.0025% of nominal at 30° C.  
**Tolerance over Temp.** ±.005% from -55° to +90° C.  
**Range:** ±.002% from -30° C to +60° C.

Send for FREE Catalog covering International's complete line. Crystals available from 100 KC to 100 MC.

**Circuit:** As specified by customer. Crystals are available for all major two-way equipments. In most cases the necessary correlation data is on file.  
**Drive level:** Maximum—10 milliwatts for fundamental, 5 milliwatts for overtones.

# NEW VERTICAL ANTENNA

## Provides Amazing Results

... even on LOW POWER

- Self-supporting
- Base insulated for 20,000 volts
- Hot-dip galvanized tubular steel construction
- Easy to erect with interlocking sections

New Lewis Vertical Antenna is equipped with winch-operated Snorkel Mast which permits you to vary the electrical length of your antenna by 18 feet! Screw-in anchor feet withstand 4,000 pounds strain . . . field tested in 80-mph winds! Requires less than 1 square yard at base . . . low standing wave ratio characteristics . . . broad band. Lewis antenna can be erected by two men in two hours or less. Mail coupon today for free details.

#### 4 SIZES AVAILABLE

Lewis 2-37'	10-20-40 Meters . . .	\$ 89.50
Lewis 3-47'	20-40-80 Meters . . .	\$107.60
Lewis 4-56'	20-40-80 Meters . . .	\$124.80
Lewis 5-66'	40-80-160 Meters . . .	\$142.00

took real work plus a strong desire to bring ham radio into his city. Thanks, Harry, and the gang: CYG, EGY, EGS, BKV, EGV, ADU, KNs BNO, BOS, DOF, BLL, DHK, and DON. Masaryktown: WN4HSN was high school valedictorian. Miami: A card from ES says he is a ranch-owner. Alonzo also says that GJ gave all his gear to LJM. KN4DRD is new, thanks to DJY. Bird Sparks: ZGL got his General Class license. JCG, DTJ, and WYR were on the WAHR ham hour. The Flamingo Net is now 2½ years old and can be placed high among nets of national interest. Ocala: DVR's NYL is now K4DQG. The Red Cross Emergency Net is composed of DVR, HCQ, HJF, ASH, and K4ANJ. Tampa: TYE meets 7 c.w. nets and 2 phone nets. Bob reports his new Viking Adventurer exciter is a help. General: NW is now MO for the Knights of the Kilocycle. Dan also is president of the FBA. Resolve now to overhaul the emergency gear and join a traffic and emergency, net. Ask me about 'em. Oh yes, the AREC is sponsored by ARRL. Affiliated Clubs sponsor ARRL activities at the local level. Traffic: (June) W4PJU 516, TYE 369, DVR 110, WS 54, WEO 35, FSS 32, LAP 30, BZI 22, IYT 19, ELS 13, FWZ 12, PBS 7, HDU 6. (May) W4IM 4, YNM 3, HDU 2.

**WESTERN FLORIDA**—SCM, Edward J. Collins, W4MS/RE—SEC: PLE. ECs: HIZ and MFY. K4AKP makes BPL for the fourth straight month. KN4ADY and KN4AEP are working hard to get their General Class licenses. BGG still is trying to find an antenna to fit his yard. GMS is working hard on a 15-meter beam. ZFL keeps the Pensy Radio Club transmitter hot. MUX is back from DX-Land. AXP is always improving his rig. CCY still is trying to put the last watt into the air. Hi, FHQ has a new project going. RUF swears by his Viking 11. YES won the DX-100 at the Pensy Hamfest. PQW missed a hamfest!! MS has the 5100-51SB going and is after s.s.b. WAC with low power. HJA has the mobile gear installed and perking FB. CQX is keeping Crestview represented. FDL and UC still are keeping the gang supplied with parts. KN4CLJ is improving the code speed. KN4DAF is putting out an FB signal. DAO/DEF keeps 75 meters hot. RZV still is kingpin of the Dagwood Net. PAA is planning a tower and beam. TTM/PTK are heard now and then. KN4AGM is going after her Technician Class license. Ed Handy's visit to the Pensy Radio Club was enjoyed by all. VR gets out FB on 7 Mc. JPD keeps the 5100 on 7 Mc. also. K4BZX has been transferred. EAR wants more audio. Traffic: K4AKP 611.

**GEORGIA**—SCM, George W. Parker, W4NS—SEC: OPE. PAMs: ACH and LXK. RMs: MTS and OCG. Nets: The Georgia Cracker Emergency Net meets on 3995 kc, Sun, 0830, Tue, and Thurs. 1900 EST: Georgia State Net (GSN) 3590 kc. Mon. through Fri. 1900 EST; Atlanta C.W. Net 7040 kc. Sun. 2100 EST. YTO is starting an antenna farm. He now has 3 poles set complete with a pair of woodpeckers in each pole. BXV is getting good reports from DX on his 45-watt 7-Mc. rig, and is looking for a Utah contact for WAS. BQT is building a sideband rig. Heard on 40 and 80 meters were KN4ANZ, APC, and DKM. CFJ operated 21 hours during the recent Operation Alert with the help of OPE and UMM. BAI (13 years old) is NCS of GSN. BWD is going mobile. IHF has moved to North Carolina. 6CDU paid a visit to the shack of FZO recently. FYC now has emergency power and is C.D. Radio Officer for Lamar County Area. BXV and BYJ are new Class IV OOs. All appointees are requested to check the dates on their certificates and send them to the SCM for endorsement if over one year old. Field Day messages are acknowledged from CVY/4, BKM/4, GNV/4, MQN/4, and ZOA/4. The entire Georgia gang had an FB time at the St. Petersburg Convention. NS has a new DX-100 on the way. YWP has his on the air. ZD and TT attended the Mobile, Ala., Hamfest. Traffic: W4CFJ 4360, P4M 356, OCG 303, DDY 55, HYV 50, IMQ 32, BWD 23, NS 22, ZUF 18, MTS 16.

**WEST INDIES**—SCM, William Werner, KP4DJ—DV renewed ORS and OBS appointments. WT finally got on with an 813 and acted as NCS of the 3925-kc. Emergency Net. ES is using a B&W s.s.b. generator to drive a 32V-3. MP is testing a kw. s.s.b. transmitter and has a new Moseley V.P. beam. ABA has cathode modulation working fine. W5VUP and W6OXS visited KP4- and KV4-Land. ABD is active on 20-meter phone. AK, AAA, AAM, ABA, ABN, DC, DJ, DV, and HZ operated at Isla Cabras on Field Day. ABD, ACF, BJ, CC, CU, KD, LK, MV, NL, QA, and VH visited Field Day operations. AAN, ABN, and ACH are on 144 Mc. with Gonsset Communicators. Emergency frequency allocations for Puerto Rico are 3825 kc. Arecibo, 3850 Guayama, 3865 Virgin Islands, 3885 San Juan and Fajardo, 3900 Ponce, 3925 Island Net frequency for NCS and District NCS only, 3950 Caguas, 3960 Aguadilla, 3980 Mayaguez. DP has 20-meter Tel Rex and new tower with rotator. MS mounted his 20-meter Tel Rex on retractable 30-ft. tower. MV brought his 20-meter Tel Rex to Field Day operations. CO, WT, ES, WR, DV, RC, DJ, HZ, R1, QM, MC, HM, PW, VH, QA, RE, QF, ZW, WW, KV4AA, and BA participated in Operation Alert. LK is putting up all-band vertical. KD and his son BJ were initiated into the Royal Order of the Wouff Hong at the South-eastern Division Convention. CC received a QSL card from DU7SV for a 3.5-Mc. QSO. NY sends greetings from Marcy, N. Y., Police Dept. and is planning an amateur radio

# Quality, Style and Beauty

## THE *ALL NEW* COMMUNICATIONS RECEIVER

- FEATURING:**
- Six bands covering .54 to 31 Mc.—AM, CW, MCW, and FS with appropriate FS converter.
  - Accurately calibrated main tuning dial plus auxiliary dial with full Electrical bandspread.
  - A ferrite transformer provides accurate antenna matching for 75 ohm unbal. and or 300 ohm balanced inputs.
  - Sensitivity: 1 (one) microvolt or better for 10-1 signal to noise power ratio, 1.5 to 31 Mc. Less than 5 microvolts for .54 to 1.5 Mc.
  - Image Ratio: Better than 60 db.
  - Selectivity: Variable in 6 steps from 200 cy to 5 KC, 5 crystal and one non-crystal positions.
  - Input: 105-125VAC 50/60 cy., approx. 90 Watts—6V.-6A, and 250VDC-.1A.
  - Output: 4, 8, 16, 600 ohms, 2 Watts high quality audio—better than 60 db hum level.

- Highly effective noise limiter—Calibrated "S" Meter—Dial locks.
- Specially designed Audio Selectivity control with variable bandwidth.
- Diversity operation is available with the GPR-D. Provisions for external control for HFO, BFO, IFO.
- SSB Coaxial IF output & Audio input.
- Cabinet or rack mounting . . . 52 lbs. . . 20" w. x 10" h. x 15" d. (Cabinet.)

auxiliary composed of AREC members in the various towns to cooperate with police and operate amateur transmitters from police stations emergency power supplies. If interested, contact Lt. Pabon, KP4DC, or your SCM, Aug. 13th was the 18th anniversary of the PRARC. Traffic: KP4WT 177, ID 54, MC 33, WR 5, DJ 4, KV4AA 4, KP4QA 3, KV4BA 2, KP4ES 1, QF 1, WW 1.

**CANAL ZONE**—SCM, Roger M. Howe, KZ5RM—Field Day was lots of fun. Location this year was the village of Gamboa where 3 transmitters were kept on the air (2 simultaneously) for 24 hours on 10, 15, and 20 meters feeding cubical quad antennas. Workers and phone operators, under the able co-chairmanship of CF and RV, were VR, LB, GF, BD, HO, JJ, WA, and JJ's XYL. Burning the midnight oil on c.w. were veterans BR, BC, and GO. Among the visitors were PB, NM, JM, MJ, FL, BC, and AE. Vacationing KZ5s are spread out like this: LR, Corpus Christi; DG and GD, en route from Santa Monica (where DG attended the YLRL Convention) to Seattle; RM, Miami; PL, Newport Beach, Calif., and en route to Honolulu; PP, El Monte, Calif.; JD, Chicago; VP and "Bill" (W5URJ-75 from KZ5CS) in Corpus Christi, with 11 prospective fathers from Coco Solo, Canal Zone, on temporary duty Stateside for a few weeks, and are they keeping the traffic circuits busy with news from the hearthside! W5LUH, Roger, PAA, flew down here twice for visits in June. Traffic: KZ5WA 154, RV 37, BR 25, RV 12.

## SOUTHWESTERN DIVISION

**LOS ANGELES**—SCM, William J. Schuch, W6CMN—SEC: QJW. RMs: BHG, GJP, and K6DQA. PAMs: PIB and YVJ. K6IYF received an RCC certificate. K6HBA has ITV. NTN. has the clicks in the GO-9 licked and again is active. Traffic-minded hams should contact K6DQA, manager of SCN. He needs help. K6BEQ now is 144-Mc. mobile. AM is running 25 watts at his town house, 900 at the ranch. HIF is very QRL at his job of railroad. YVJ is moving to a new home in West Valley. K6EA is QRL with paint brush on the shack and also is working MARS. KN6HOV dropped the "N" from his call. K6COP worked his first VS. The San Fernando gang holds bi-monthly transmitter hunts. All comers are welcome. Contact MEP, CHR, or HGZ for information. The San Bernardino Micro Wave Society worked Field Day on 56, 144, 220, 2400, and 3400 Mc. and came up with a total of 306 stations for a score of 6165 points. A new net is operating on 6 meters and is tied in with the 2 x 4 Net. It is called 2 x 6; K6HKS is net control. Most OOs report they could have done a bang-up business on Field Day. CMN, GJP, and GYH will be at Needles for the Marathon Boat Races Oct. 2nd, a yearly chore for them. ESR has a new 14-Mc. beam. The Beachwood Amateur Radio Club meets in Hollywood. Contact K6ELX for the dope. RRU and MBA have finished "Q" multipliers and report great results. The Hughes Aircraft employees have formed a new club. Contact K6HKE for information. So many clubs have sent in information on Field Day that it would be impossible to enumerate them all here. By the looks of some of the scores the West Coast should place well up in the national percentage. KN6ITO is Mayor of Avalon. K6DBI and W6EAB are on the technical staff of KBIG, Catalina Island. Thanks, Mel. KZ5BE visited W6GYH and BP. Reports are coming in late, gang; help me out by getting them here immediately after the first. Thanks. Traffic: W6GYH 285, K6EJT 271, DQA 159, W6MBW 152, BHG 138, WPF 128, USY 114, CAK 39, K6COP 39, HOV 33, W6CK 24, ORS 20, K6EA 17, W6YVJ 16, CBO 14, K6KCI 12, W5NTN 11, WT 11, GJP 10, HIF 9, K6IYF 8, W6AM 6, K6ELX 6, HBA 3, BEQ 1, LTA 1, UED 1. (May) W6MBW 413, TDO 87, KN6JJN 6, W6NTN 1.

**ARIZONA**—SCM, Albert H. Steinbrecher, W7LVR—Asst. SCMs: Kenneth P. Cole, 7QZLH, and Dr. John A. Stewart, 7SX. SEC: VRB. PAM: KOY. Arizona 'Phone Net: Tue. and Thurs. 7 p.m. MST, 3865 kc. The month of June saw quite a bit of activity around the State. The Nationwide Civil Defense "Operation Alert" embraced 40 operators located in 14 communities in Arizona. The following towns and calls were represented: Phoenix: KOY and RBA were NCS for the State, with QZX and YFG located at State C.D. Headquarters. Other Phoenix stations were MAE, MQW, NCL, QZH, SUL, UYA, and mobiles JLW, NAP, and TNY. Tucson: LAD was NCS at C.D. Headquarters with LHD and ULP. Mobiles located around the City were: LVR, MOB, MQE, QHD, RNB, STV, UCX, VZJ, and YXE. Flagstaff: LSK. Fort Huachuca: 5GK. Fry: MES. Gila Bend: LFZ. Globe: PKM. Kingman: UNK. Morenci: LZT and PXM/M. Payson: VYM. Prescott: OPY. Weldon: RIP. Winslow: PJY. Yuma: OFA, TJT, and WBG. The OPRC elected MOB, pres.; ULP, vice-pres.; LAD, secy-treas. Field Day found 4 groups active around the State: Yuma: ACN, BMC, EYT, JNY, OEE, OFA, SNR, TJT, WNO, WRP, ZTA, ZTR, ZZZ, 0ICF, and 6ANI were at Boy Scout Park. Other groups were on Mount Lemmon, with LMP and PZ on Mingus Mountain and Mt. Union. WUG has left for CT2-Land and will be on the lookout for Arizona contacts. His call will be CS5AC. Traffic: W7WUG 54, LVR 16.

**SAN DIEGO**—SCM, Don Stansifer, W6LRU—All are

# Time Savers . . .

*BESET* with a knotty technical problem? Why not let an ARRL Lightning Calculator provide solution and save hours of operating time, or time you might better spend in constructing that new rig.

*IF YOU'RE* trying to figure out how many turns to wind on a coil for a particular band, you'll find the answer more quickly by using the Type A Calculator, designed especially for problems involving frequency, inductance and capacity. Direct-reading answers to Ohm's Law problems involving resistance, voltage, current and power may be obtained rapidly on the Type B Calculator. Be sure — and be accurate — with one of these dandy time savers.

## ARRL LIGHTNING CALCULATOR

Type A or Type B

\$1.25 postpaid

THE AMERICAN RADIO RELAY LEAGUE

West Hartford 7, Conn.

reminded that the Southwestern Division Convention will be held Sept. 30th, Oct. 1st, and Oct. 2nd in San Diego. Everyone is invited. WYA, convention chairman, has returned from the East where he visited Headquarters. A new club, the Mike and Key Club, is desirous of affiliation with ARRL. Officers are: K6DVD, pres.; K6CJS, vice-pres.; W6URP, secy.; and K6JHD, treas. They invite any interested parties to contact URP. Most members are from the Lemon Grove/La Mesa/Encanto Area. IAB, at Camp Pendleton, is on 2 meters with 100 watts. BAM, old-time DXer in Santa Ana, worked VQ6LQ and hopes to reach 200 countries some day. Ex-KH6AJF and K7L7BLG now are operating from YDK. KL7MF, ex-SIG; ex-MI, and his wife, Louise, were recent San Diego visitors while on vacation. The picnic at Orange County Park was very successful, as was the Upper Ten Picnic at Cardiff. OZO is sporting a new Communicator on 2 meters. Two fine examples of amateur public relations were evident recently when stations were manned at the Orange County Home Show and the San Diego County Fair. Credit goes to VFT, the SEC, and the AREC members who manned the station at the San Diego Fair with an impressive array. CAE has passed the 170 mark in countries worked. CRT still is working new ones. WNN worked VS4CT in Sarawak on 14-Mc. phone. ZWK also is heard working DX on 14-Mc. phone. LRU has a 75A-1 and still is hunting for country No. 200. Field Day is over, and from all indications the largest turnout in the section in history was recorded. Some very terrific scores were run up, and a good time was had by all participating. Traffic: W6LAB 2581, YDK 1514, K6DBG 26.

**SANTA BARBARA** — SCM, William B. Farwell, W6QIW — New appointments: K6KPU as SEC; KCD as ORS and OPS. Glad to have K6KPU as our new SEC. We know he will make a good one. KFM is new Communication Chief, C.D. and Disaster Corp. Santa Barbara. JCQ is Communication Chief for Region Seven. Congrats to KN6LFQ on getting his ham ticket the hard way. He is blind. GYI is stationed on desolated San Nicholas Island. KN6JUN has a new four-element beam on 145 Mc. WYN has gone with the Navy to Hawaii. K6CNY is conducting a code and theory class. All the clubs in the Santa Barbara section were very active on Field Day and your SCM received Field Day messages from all. QHC puts out a potent signal on s.s.b. Traffic: K6NBI 85, W6QIW 56, NKT 26, BRY 18, K6CNY 11, KPU 9, W6YCF 5, PKW 2.

## WEST GULF DIVISION

**NORTHERN TEXAS** — SCM, T. Bruce Craig, W5JQD — SEC: RRM; PAMs: PAK and IWQ. RMs: PCN and QHI. QDF is out of the Air Force and attending Tech College. K5FID now is the call at Reese AFB, Lubbock, with ZFB as chief operator. The Panhandle Amateur Radio Club at Amarillo announced new officers are SOC, pres.; YYR, vice-pres.; CKV, secy.-treas. AHC served as relay in long skip from Lubbock to Ralls when a storm destroyed communications. JQD handled only a few messages through IWV. NTX (No. Tex. C.W. Net) meets on 3770 kc. at 1845 daily and needs more stations. The Snyder Amateur Radio Club had a pleasant surprise June 21st when Milt Russel, DL4FZ, from Germany, dropped in to visit and join the club. WN5GTW reports completion of WAS. Regan County Amateurs (Texon) report a good Field Day; a new ham is KN5BBO; WWF furnished the transmitter for Field Day; GKY uses a 33-ft. vertical made from telescoping TV mast and works FB on 40 and 15 meters; WNJ/M received Q5S9 from Guam on 40-meter mobile. ACK plans a new transmitter with grid-block keying. K5FFB is net control of the Yankee Net (0900 on 7290 kc. daily). DTA/5 reports WAS on 75-meter c.w. with 65 watts. NFO reports the Terry County Radio Club will have a hidden transmitter hunt. MBP reports 82 per cent attendance on the Blue Ridge Net (160 meters) for June. LR (originally W5LY) has returned to Dallas after 2 years with the FCDA in Chicago. He reports the Oak Cliff Radio Club is in the planning stage. ACU, JUN, and JQD vacationed in New Mexico and worked PTK (the son of JQD) on regular schedules. Traffic: W5KPB 185, UBW 144, CVA 124, FJB 120, AHC 91, PAK 64, CF 33, TFP 33, ACK 32, CVW 25, ZTB 16, ASA 13.

**OKLAHOMA** — SCM, Dr. Will G. Crandall, W5RST — Asst. SCM: Ewing Canady, 5GIQ. SEC: KY. RM: GVS. PAMs: PML, SVR, and ROZ. The high point of the month was, of course, the West Gulf Division Convention at Fort Worth, which was excellently managed and had a wonderful attendance, giving many of us a chance for a QSO "vis-a-vis" with those we had been meeting on the air for years. Many questions were thrashed out at the various sectional meetings. The Bar-B-Q and dance was well attended and only marred by the sudden death of IIK. One of the fine things at the Convention was the presentation, in absentia, of a scroll signed by the net controls of the North Texas-Oklahoma Traffic Net to PAK in recognition of his splendid services as net manager. Everyone who attended seemed satisfied that CF had been elected Director of the West Gulf Division. The Watonga Ham Picnic was reported a success by all. We expect good results from JCB, new Oklahoma County EC. DFV is the New Payne County EC, succeeding TKE. GVV should be heard more often on ham

# 2 DX Bands!

with the

## mosley "Ten-Twenty"

TRUE BEAM PERFORMANCE on both 10 and 20 Meters . . . and all you do is change bands at the transmitter!

Two peak-pretuned 3 element beams, inter-lace mounted on one boom, give you real DX action! The Exclusive Auto-Electronic Coupling—that permits feeding both beams with just one coax line—means Unequalled operating convenience! The story, below, will tell you why Your Best Beam Buy ... is the New "Ten Twenty"!

### SPECIFICATIONS and DATA — Model VPA-1020

Forward Gain (over full size dipole): 7.5db.

Front-to-Back Ratio: 28db.

S W R: 1.5/1, or better, at resonant frequencies.

(Performance data essentially the same for both ten and twenty meter operation.)

Elements: 61ST6 Tubular Aluminum. Maximum length, 22½'.

Boom: 1½" OD 61ST6 Aluminum. 12' long.

Wind Surface Area: 11.4 sq. ft.

Wind Load: 228 lbs.

Weight (Assembled): 57 lbs.

Tuning: FACTORY PRETUNED to three resonant frequencies in each band. Drilled and color coded element sections.

Model VPA-1020, complete with "V-P" Coils, Auto-Electronic Coupling Yoke, all necessary hardware and full instructions. Less mast, rotor and coax line.

AMATEUR NET PRICE \$120.79

### New! Mosley Loading Coils

for 40, 75 & 80 Meter

#### 'Vest Pocket' Dipoles

Not enough space for a "long wire"? — Here's the answer! Use a MOSLEY 'V-P' Dipole Loading Coil to make a high performance dipole antenna at about one-half the length of a full size dipole. Just one coil needed for each antenna. Use 52 or 75 ohm coax.

Model No. 40-D  
40 Meter Coil  
Net Price \$7.95

Model No. 75/80-D  
75 or 80 Meter Coil  
Net Price \$7.95

### Every MOSLEY Product Advertised ...

... is AVAILABLE NOW!

Mosley manufacturing and shipping facilities are being constantly expanded to keep pace with the ever-increasing demand for popular 'Vest Pocket' Rotary Beam Antennas and other Mosley Amateur equipment.

Every Mosley product advertised is in production and readily available through your Ham Equipment Supplier.

**SOUTHERN TEXAS** — SCM, Morley Bartholomew, W5QDX — SEC: QEM. The Fort Worth Convention was a big success. The guys and gals who spent much of their time to put on the show deserve a vote of thanks. Galveston was selected for the 1956 Convention. VUS, Galveston Area EC, has that section ready for any emergency. AET, Hidalgo County EC, has spent more than two years to completely organize the hams there. Seventy-seven were in attendance July 3rd at a barbecue given by WIS at his farm. YXH spent several weeks in the hospital. According to last reports Vince is on the mend. URW has a new DX-100. The 144 and Up Club held its second V.H.F. Roundup July 3rd on the farm of FSC near Deanville. KN5BFJ has just gotten on the air. FND is on 2 meters, while DIC and HHO are busy completing their 2-meter rigs. The Texas YL Roundup Net meets each Thurs. 8:30 A.M. on 3880 kc. All YLs are invited to check in. NC is WXY, the alternate is ZPD. LOW is busy organizing the Corpus Christi emergency group. QZZ soon will be operating /KL7 from Anchorage. TQL is portable at Rockdale this summer. MN keeps regular schedules with KH6AJF. CTZ, DFA, EPZ, UNZ, WN5s HTE, HTG, and HTJ kept regular schedules with their families at Houston while attending summer encampment with the Texas National Guard at Fort Hood. Fellows, please send in your activities reports. Traffic: W5MN 299, URW 11.

**NEW MEXICO** — SCM, Einar H. Morterud, W5FPB — SEC: KCW. PAM: BIW. V.H.F. PAM: FPB. RM: JZT. The NMEPN meets on 3838 kc. Tue. and Thurs. at 1800 MST, Sun. at 0730; the NM Breakfast Club meets on 3838 kc. daily except Sun. at 0700-0830 MST. The NM C.W. Net meets on 3633 kc. daily at 1900 MST. ZU and his XYL, CEE, and your SCM attended the West Gulf Division Convention. NSJ is running 120 watts to an 829B on 50 Mc. and has worked 20 states; he also is building 50- and 430-Mc. portables. KWP is active on 50 Mc. and is building a 28-50-Mc. rig for mobile or portable. MYI is putting a 6146 on 50 Mc. and has a 1-watt 50-Mc. handy-talkie. MYQ is building a Ferriswheel for receiver alignment. RFF is building a 28-50-144 Mc. receiver with variable i.f. New appointees: NQG and ZU as ECs; MSG and WNU as OOs; RFF and WNU as ORSs. Many old appointments that were not endorsed have been cancelled. There are 64 active members in the Albuquerque, Los Alamos, Mesilla Valley, and Roswell Chapters of the Amateur Radio Caravan Club of New Mexico. KN5ADS, W5FAG, ECS, FJE, FMM, OAL, PIZ, UCX, VJN, and ZSL assisted in the Albuquerque Operation Alert. Hobbs, Los Alamos, Mesilla Valley, and Sandia Base Radio Clubs, K5ADQ, W5DAH, PIZ, WBJ, and W9TLM/5 participated in Field Day. Traffic: (June) K5FEF 171, W5CEE 31, RFF 28, BZB 9, ECS 2. (May) K5FHU 1119.

## CANADIAN DIVISION

**MARITIME** — SCM, Douglas C. Johnson, VE1OM — Asst. SCMs: Fritz A. Webb, 1DB, Aaron D. Solomon, 1OC. SEC: RR. From Field Day messages received, the following are calls of clubs or groups active on that week end: VE1s IM, CW, FO, RC, WO, ND, LC, SH, GM, DN, JV, VO 1T/VO2. VE1WL was active as a Class B station. Recent visitors to Halifax were W1TQP and VE2AHZ. The latter is known professionally as the "Great Morton." VC is busy putting the finishing touches to a new DX-100 transmitter. Bill reports the meeting of the Bathurst and Campbellton AREC each Sunday morning. IT is a new N. B. ham and operates 80-meter c.w. on the low end. Bouquets to KZ for his untiring efforts in providing hams with P.E.I. QSOs for the WAVE award. AEB is testing a new 60-watt official mobile unit and it promises to put out a husky signal from the Restigouche Area. Congrats to BN. In the recent Frequency Measuring Test Les came up with an average error of 21.7 parts per million. EF, QY, and OM have been busy giving out with N. S. QSOs on 50 Mc. during recent good openings. W2WSP has been heard mobiling in the Liverpool Area. Traffic: VO6AH 215, VE1FQ 122, AV 56, VO6AF 32, VE1UT 31, ME 16, GA 15, OM 8, ABZ 7.

**ONTARIO** — SCM, G. Eric Farquhar, VE3IA — Field Day in this section was most successful and now that it is over the gang is getting back to normal operation. While the summer lull is upon us mobilers and traffic-handling stations are active. Active in Alert No. 2 were FU, BKX, BIW, AHL, BY, IE, BUR, EAM, DU, and HO. BNQ, striving for WAPA, tallies 18 out of a possible 63 counties. The North Bay Hamfest again was voted the best yet. The last meeting of London Amateur Radio Club was very profitable to those attending, who heard YJ deliver an excellent discussion on antennas and transmission lines. YZ has a home-brew transistor receiver. BSD is the call of the Quinte ARC, Belleville. BCV is back on the air after a long absence. BSW vacationed in the Maritimes and

(Continued on page 108)

*"Worked 87 foreign countries, all continents and 30 zones" with a Gotham Antenna and 35 watts.*

## READ THIS AMAZING LETTER: How an inexpensive **FULL SIZE** Gotham Rotary Beam made it possible to "work the world!"

Gotham Hobby Corp.  
107 East 126th St.,  
New York 35, N. Y.  
Gentlemen:

Florida, 1955

I'd like to express my enthusiasm and satisfaction regarding your 20-meter rotary beam antenna. I purchased one of your standard two-element units in February of this year. Prior to this time I had been using a collinear array about one wavelength above ground. The transmitter feeding this antenna had a power output of about 35 watts, and results were quite discouraging.

When my Gotham arrived, it was easily assembled in a couple hours. The same transmitter was used to excite the Gotham antenna, using the same power as before. Results have been quite gratifying, and it is interesting to note that in the three months since using the Gotham antenna, I have worked 87 foreign countries, all continents, and 30 zones.

I am able to keep schedule with amateur radio —\* in the Cape Verde Islands every week. *It was impossible to even hear this station before using the Gotham beam.*

Extremely high winds are prevalent in this part of Florida. The Gotham beam has withstood blows in excess of 50 miles an hour without failure.

The elements bend almost double in these high winds, but readily return to their original configuration when the wind abates. I feel that this is an extremely important feature of the Gotham antenna.

I have enthusiastically recommended Gotham to all the hams who ask what type I am using (and most of them do, when I tell them the amount of power I'm using). I wish you every success with your product, and feel that it is well worth the modest price.

Yours very truly,

(Names and \*call letters upon request.)

### EVERY FULL-SIZE GOTHAM ROTARY BEAM IS ENGINEERED FOR SIMPLICITY, STRENGTH, PERFORMANCE

Your Gotham comes to you completely fabricated, made (except for the polystyrene insulator) entirely of new, rustless, first-quality mill stock aluminum. You'll find no link coupling, no complicated mounts, no tuning stubs. You get good, solid aluminum tubing—and more of it, in both length and thickness (the only true gauge of \$ value)! No flimsy wire, no wood to rot or weather-proof.

Easy assembly, simple and quick matching of line to antenna. Yet Gotham's price is 25% to 75% lower than the "toy" midget beams which Gotham so easily out-performs.

Approved for G. I. training

dropped into Headquarters. With deep regret we record the sudden passing of Bert Knowles, QB. For many years he worked faithfully as QSL Manager for this section. It is regrettable that no one took time to inform us more fully, yet several stations were heard indicating their wish that they be appointed but a few hours after the news broke! To us this is not ham radio. To the incoming QSL Manager, whose appointment comes from Headquarters, we extend best wishes and trust that he will follow the high standard of service to ham radio that Bert set. Traffic: (June) VE3VZ 120, NO 92, BUR 77, DPO 68, KM 40, AUU 37, TO 2, VD 1. (May) VE3DPO 192.

**QUEBEC** — SCM, Gordon A. Lynn, VE2GL — It is with regret that we record the passing of ASW. Dr. Stockwell died very suddenly in the middle of June and the sympathy of the entire VE2 gang is extended to the bereaved. Field Day held the spotlight in activity in June, VE2 being represented by many groups in many parts of the Province. BK operates week ends from his summer QTH at Dunany with 120 watts to a pair of 6146s and has an 813 linear on c.w., a.m., and s.s.b. from the home QTH. XX's new mobile in the new car sounds FB, as does that of WK, who has an Elmac AF67 with 60 watts. BE is enjoying s.s.b. and BG is gradually falling too! Recently-appointed Asst. EC VE2ADD was active with his Amos members in search for a missing man. OB has a new jr. operator. FL has acquired a Mark II which will be at the disposal of all area AREC members as a portable station when needed. EC reports continuing skeds daily at 0830 and 1300 on 3.7 Mc. with KJ, APP, UB, and AOB. ACS is operating from Forestville for the summer. ANK and AUH are fighting for WAS. KG is building a new rig with 829 final for the new car. PQN continues operating on a reduced summer schedule, Mon., Wed., and Fri. at 7:15 p.m. on 3670 kc. Traffic: VE2EC 35, GL 14, FL 10.

**ALBERTA** — SCM, Sydney T. Jones, VE6MJ — PAM: OD. RM: XG. The NARC has lost its president, ZR. Ernie and his XYL have moved to Montreal with CPA. Best wishes from the Edmonton gang, Ernie and Barbara. YD was heard recently on 3.7-Mc. 'phone after a long absence. BI has been bitten by the ham bug again. MJ is considering mobile operation. HM and NX kept in touch with Isachsen and relayed traffic in connection with the mercy flight. NX has made DXCC. VE8MD is visiting with HM before taking off for the north to install another weather station. OS reports two new calls in Lethbridge, MR and UL. WC has made a start on the new 813 final. AL has gremlins in the new rig. Congratulations to PV on his election to membership in the A-1 Operator Club. GD was heard from his mobile while operating in British Columbia. CE and family have returned from a vacation to Vancouver Island. His son Peter is sporting a brand-new call. Traffic: VE6HM 67, NX 55, OD 32, YE 25, WC 16, MJ 6.

**SASKATCHEWAN** — SCM, Harold R. Horn, VE5HR — Sorry, gang, but the SX-96 did not stay with us. 2BG, Canada's oldest licensed ham (1907), was the lucky man. 5AI won the Gus Cox Trophy for c.w. Lorne turned out an FB copy for c.w. MQ is the proud possessor of the furlined button holes for the efforts in the Liars Contest. 3EY, ex-5UO from Ottawa, came the longest distance, with 7QE second. 7QE also was the oldest ham at the hamfest. PT was the youngest. MO was first in finding the hidden transmitter, with TH coming second. TH also put over some FB sports events for the ladies and youngsters. The best mobile was won by LW, with BL second. XX and YY, Keith and June Baker, our newest hams, helped to show that Regina holds some kind of a record for double-letter calls. NN, WW, XX, YY, and ZZ all have Regina as their QTH. 6PE, 4AS, 4GE, and 4RF were other districts represented. To those who came to the hamfest, thanks again and we hope you enjoyed yourselves. To the others, sorry you could not make it but hope to see you at the next one.

## FEED-BACK

W8MNX informs us that the part number for the modulation transformer in the 50-Mc. rig, described in July *QST*, is A-3008 instead of A-3003.

In the "Four Band S.S.B. VFO," July *QST*, the grid resistor should be 0.1 megohm instead of 0.01 megohm.

## What Is This Thing Called the "Hump" in CODE?

THE *hump* (around 8 words) is the thing that tells you you have wasted your time by starting out wrong. Thirty years ago when we started teaching Code, our students too ran head-on into the *hump*. We went to work to find out why. TWO-PHASE, STEP BY STEP instruction is the perfect answer. In this method dotdash is not A. The SOUND resulting from dotdash is A. There is also the important factor of correct timing. If the signals are not timed correctly the resulting sound will not be correct. There are many, many things connected with proper Code instruction, many of them so small they seem inconsequential. Others are so technical that many so-called experts fail to understand them. It's a long story but I have it all written up and will be glad to send it to you. A postcard will bring you the full story.

TELEPLEX CO. 415 G. St., MODESTO, CALIFORNIA

## A Paying Proposition!

Maintenance of commercial mobile-radio installations is big business... still growing fast... pays good money... and regularly!

It's a natural for hams!

HERE ARE THE TEST INSTRUMENTS PREFERRED BY EXPERIENCED ENGINEERS:

LAMPKIN 105-B MICROMETER FREQUENCY METER

Heterodyne type. Range 0.1 to 500 MC., all channels. Pinpoint VHF CW signal source. Weight 13 lbs. Width 13". Price \$220.00 net.

LAMPKIN 205-A FM MODULATION METER

Measures FM voice deviation,  $\pm 25$  KC. Tunes 25-500 MC. in one band. Speaker. Oscilloscope output. Weight 13 lbs. Width 12". Price \$240.00 net.

Both instruments meet FCC mobile specs... are easy-to-carry... but rugged and accurate.

You can build your radio knowledge into a profitable business, full- or spare-time! How?... ask for booklet "How to Make Money in Mobile-Radio Maintenance". No charge... Act Now!

## Solarized QSO

(Continued from page 11)

CQ-1) amplifier. Although the receiver was usually limited to 'phone reception only, the "rushing" noise of very strong c.w. signals could sometimes be copied. A separate random-length antenna was used for receiving.

Fig. 3—Transistor receiver using a crystal detector and transistor amplifier.

### Results

A total of four two-way contacts, two 'phone and two c.w., was made with Field Day stations W1ICP/1 and W1DXI/1. Both of these stations reported the solar-powered signals loud and clear. Although the distances involved for these contacts were only a few hundred feet, several miles could probably be worked with proper antennas and good conditions.

## Code-Practice Oscillator

(Continued from page 22)

the peak current, and in conjunction with the 20- $\mu$ f. condenser provides sufficient filtering to give a crystal-like tone. The two resistors in series across the plate supply serve as a bleeder and help to hold the voltage under control when the oscillator section is not operating.

The second triode section of the 12AU7 functions as an oscillator in a Hartley circuit in which the plate is at ground potential for audio, with output taken from the cathode circuit. The voltage drop across the 2000-ohm resistor in the plate-supply section provides the necessary 10 volts to bias the triode to cut-off. Only the bias voltage of 10 volts appears across the key.

The 3-4-ohm voice coil of the usual 2- to 4-inch speaker is connected directly in the cathode return, eliminating the output to voice-coil transformer usually required. A speaker without the output transformer compares in cost with low-cost 'phones, therefore speaker output can be obtained without increased cost. If it is desired to use headphones, they may be connected at the points indicated. Suitable output was obtained using 'phones from 500 ohms up. (If the speaker is omitted, the negative supply lead is connected directly to the bottom of  $L_1$ .)

The heater circuit should not be grounded, because the full plate voltage would appear between the cathode and heater in the rectifier section. With the heater floating, the cathode-to-heater insulation of the two sections is in series, providing sufficient rating for the voltage used.

# TILT OVER TOWERS

Devised and created by E-Z Way over 5 years ago. Often copied but never equalled.  
(Patent applied for.)

## TESTED AND PROVEN

More than 15,000 satisfied users. "Ask the Ham who owns one." (Courtesy, Packard.) We make one of the sturdiest and most versatile towers in the industry. Don't send a boy to do a man's job. E-Z Way Towers are designed to support Rotary Beams—not just a light weight TV antenna. We invite comparison.

## TILT OVER with GROUND POST

Six types to choose from—40 to 65 ft. Built to support anything from a Mini-Beam to the heaviest. Cranks down and tilts over for quick, easy adjustment. No guy wires needed. Ground post is 3½" steel pipe or larger.

G PRBD	40.....	\$120
G PRBD S	40-45.....	\$160
G PRBD S	50-60.....	\$210
G PRBD S	60-65.....	\$260
G PRBD X	50-55.....	\$325
G PRBD X	60-65.....	\$385

Three types to choose from—40 to 60 ft. Ideal one-man installation for flat roofs or porches. Cranks up and down and lays over for easy antenna adjustment. No guy wires needed. Tower is locked in a V-bracket at top of gin pole.

GIN-RBD	40	\$125.00
GIN-RBD	40-45	\$165.00
GIN-RBD	50-60	\$215.00

## LAY-OVER With Gin Pole

We pay freight charges on any towers shipped in U. S.

Add 10% to prices shown for West Coast orders. All E-Z Way Towers have heavy dip-coated Goodyear Pilotite S-5 (rubber base aluminum enamel). Hot dipped galvanized available at extra charge. Lightest cables used on our Ham towers is 2000 lb. test—most cables used are 2600 lb. test.

Provisions to mount rotor inside top of tower. Bearings at A and B relieve all strain from rotor.

## BUILD IT YOURSELF

Go as high as you like with 20 ft. sections. 320 ft.?

### C-10

Width 10"  
Max. Height  
120 ft.  
Guy Spacing  
27 ft.  
Weight per  
ft. 4½ lbs.  
Price

New York 3, N. Y.

## Construction

To benefit from the circuit design, the unit should be completely enclosed in a cabinet. A midget speaker case makes a fine enclosure, and can be fitted with a subpanel and, if required, a perforated metal back plate. Alternately, a sloping-front meter case can be easily fitted with a grille at even less cost.

The original unit pictured was constructed in a case which may be recognized as a surplus electric-blanket control. A perforated metal speaker grille replaces the original thermometer-type dial arrangement. The knob on the left is the off-on switch which was an original part. The key jack is located behind the hole on the right. Although these surplus units have been available for a nominal price, few parts, other than the case, are adaptable to this construction.

## Wiring

Wiring is straightforward and no difficulty will be experienced if the socket terminals are checked carefully and the proper polarity of the 20- $\mu$ f. electrolytic filter condenser is observed. Polarity of the coil  $L_1$  is not critical, in event one of another make is used and its leads are coded differently from the one shown (the center-tap must of course be correctly identified). Since the values of  $L_1$  and  $C_2$  determine the tone, any large deviation in  $L_1$  may require a change in the value of  $C_2$ . A simple trial-and-error process will achieve a pleasing tone.

## Civil Defense Package

(Continued from page 29)

slight a.c. hum on the modulation which was cleared up by changing the grounding point of the cathode and screen-grid by-pass condensers of the first audio stage from a ground lug on the power socket to a ground lug near the tube socket.

In tuning up the transmitter, the meter switch should be set to read doubler grid current and the crystal plate should be tuned for maximum reading, which will be around 0.5 ma. The crystal-oscillator plate current will be 5 or 6 ma. Next, tune the doubler for maximum final-amplifier grid current. This should be 3 or 4 ma. with a doubler plate current of about 20 ma. Attach a 10-watt light bulb as a dummy load and tune the final amplifier for maximum brightness of the bulb. The bulb should just perceptibly brighten further with voice modulation. The plate-current dip in the final amplifier should run around 40 to 50 ma., loaded, and the modulator plate current should kick up from a static value of 2.5 ma. to a maximum of 50 to 60 ma.

Measure the bias voltage across the resistor in the center tap of the power supply and adjust the slider for 22 volts bias. The slider should be set at 166 ohms. Make the adjustment with the transmitter on, as it takes the full current in the transmit position to cause the 22-volt drop across the resistor. The voltage will be less during re-

(Continued on page 114)

# WHILE NEW YORK CITY SLEEPS Amperex® VHF TUBES STAND GUARD

... and over 70,000 Amperex 5894 or 6252 VHF transmitting tubes are now in use all over the country, in approved equipment by Fire Departments, Civil Defense, Police and other Municipal Emergency Services...

**because  
Amperex TUBES  
have proven  
MOST DEPENDABLE**

If disaster should strike, will your communication equipment meet the test? In time of disaster, there is no substitute for dependability — even initial cost becomes secondary! Long life, ruggedness and reliability were the watchwords in the final selection of these tubes. If you are planning new fixed or mobile stations, insist on AMPEREX type 5894 or 6252 to be sure!

Sonor Radio Corporation's FCDA-approved, Model CD-2 Transmitter, designed for CD fixed and emergency operation uses the Amperex type 6252.

Radio Engineering Laboratories' Type 715 Transmitter, used by New York City's Fire Department, employs the Amperex type 5894.

## COMPARISON PROVES AMPEREX SUPERIORITY

Maximum Plate Input & Voltage V5 Frequency  
(Push-pull, Class C Operation)

Service ICAS	Frequency Band (Mc)	AMPEREX 6252		Nearest Rated Competitive Tube	
		Plate Input Watts	Plate Volts	Plate input Watts	Plate Volts
Plate	144-148	72	600	49	435
Modulated	220-225	72	600	44	370
Telephony	420-450	51.5	475	31	300

The AMPEREX 6252 ICAS higher voltage and input ratings show the advantage of the independently suspended anode construction which eliminates the need for internal insulation. Competitive tubes use mica insulators between the plate and the rest of the internal structure, resulting in low maximum anode voltage and greater derating at higher frequencies.

## LETTINE RADIO MFG. CO.

62 Berkeley St.

Valley Stream, N. Y.

ceiving, but the bias is not used during reception.

For dependable service, which is necessary in c.d. work, all components should be used well within their ratings. This applies to tubes as well as resistors and condensers. A stock of spare tubes and parts should be kept with the equipment in case of failure at a critical time.

## Results

In actual use on the air in c.d. drills, this little peanut whistle has performed very well. The receiver also performs well, and although it is not selective enough for regular amateur use (it could be made so) it is ideal for c.d. work. No retuning is necessary for different net stations even though their crystals are 1 or 2 kilocycles high or low.

Installed as a mobile, other mobiles have been worked at distances up to 30 miles during c.d. drills.

Last but not least, there is no TVI from harmonics when a good low-pass filter is used (this is a must), even though the TV set is in the same room. However, it may be necessary to install a few high-pass filters on some near-by TV sets to prevent fundamental overload, even with the low power.

## W/VE Contest

(Continued from page 58)

contact; (2) your call; (3) RST report given; (4) ARRL section. Example: NR 1 W0ZZZ 579 Kansas.

4) One point may be counted for each exchange sent and acknowledged. One point may be counted for each exchange received. For contest credit a station may be worked once on 'phone and once on c.w. on each band. VE/VO stations will multiply the total points by the number of U.S.A. ARRL sections worked. W/K stations will multiply the total points by the number of VE areas worked and also by 7.11, there being nine Canadian areas (VE1 through 8 plus VO).

A station using a power input of 30 watts or less will receive an additional multiplier of 2, and a station using from 30 watts to 100 watts will receive one of 1.5. The final score consists of "total points" multiplied by "sections" (times 7.11 in case of W/K stations) multiplied by the "power multiplier."

5) Each entry must be accompanied by the following declaration: "I hereby state that my station was operated strictly in accordance with the rules of the contest and governmental radio regulations, and I agree that the decision of the Contest Committee of the Montreal Amateur Radio Club, Inc., shall be final in all cases of dispute."

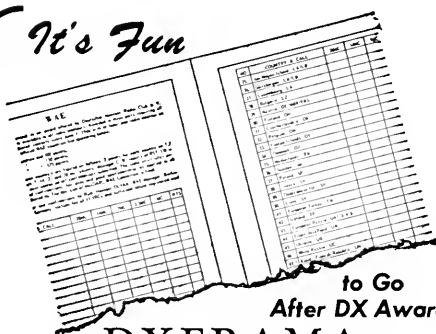

6) All entries shall be sent to Gordy Webster, VE2BB, 69 Pine Beach, Dorval, Quebec, Canada, and must be postmarked not later than midnight October 15, 1955.

## & Strays

During a practice alert, messages poured into Pinedale, Calif., civil defense headquarters. The texts of these messages were concerned with evacuation, radioactive fall-out, etc. Operators were stunned though when they received this one: "Waiting since 5:30, stop. Dinner cold, stop. Drop dead, end." It was sent by the wife of a Fresno ham!

## Is YOUR Voice Heard?

FOR more than forty years, the American Radio Relay League has been the amateur's own organization, operating under policies established by directors of his choice, serving as a clearing-house for information, representing him at international conventions, before Federal agencies and national groups, and providing other services to make his hobby enjoyable as well as useful.

MEMBERS of the League in eight ARRL Divisions will soon be nominating and voting for the directors who will represent them for the next two years. Every amateur taking part in these elections helps further the aims and protects the privileges he has as a ham. Naturally, only League members vote in ARRL elections. Let your voice be heard—sign up now.

## 144-Mc. Amplifier

(Continued from page 32)

condition, the final grid current peaks at the same tuning setting as that for minimum plate current.

The amplifier is operated at 2000 volts on the plates, at 250 ma. Modulation is supplied by a

REAR SUPPORT FOR PLATE LINES  
(2 REQUIRED)

PLATE LINE SUPPORTS AT TANK CONDENSER  
(2 REQUIRED)

Fig. 3—Plate line accessories for the 2-meter amplifier. The shorting bar is made from a single piece of  $\frac{3}{16}$ -inch brass. It is sawed along the dotted line after the holes are drilled. Screw holes in upper portion clear 4-36 screws. Lower portion is tapped. Rear supports for line can be made from a single  $1 \times \frac{5}{8}$ -inch piece of brass if proper drilling tools are available, or they can be made from  $1 \times \frac{3}{4}$ -inch stock and then cut at center with hacksaw. Contacts for the tuning capacitor are made from  $\frac{1}{2} \times \frac{1}{16}$ -inch soft copper bus, formed around line with a soft hammer. All parts silver plated after completion.

pair of 811-As running at zero bias, having an output capability of around 300 watts. Checks have been made with the aid of an audio oscillator and an oscilloscope, and the amplifier operates very stably at 100 per cent modulation, either sine wave or voice, and the 'scope pattern shows good linearity in the modulated stage.

WE SPECIALIZE IN FOREIGN TRADE

Compact!  
Functional!

Types  
C and D

Designing and building your own gear? Compact Johnson transmitting capacitors provide more capacity per cubic inch. Mounting brackets furnished for normal or inverted mounting—shafts extend both front and rear for design flexibility. Available in single and dual types.

For complete information on Johnson capacitors or other quality components, write for your copy of Components Catalog 976.

## JOHNSON TRANSMITTING CAPACITORS

**TYPE C and D**—For high voltage—high power applications. Maximum capacities from 50 to 500 mmfd. Breakdown ratings from 3,500 to 11,000 volts. Steatite insulators, aluminum end frames, 1/4" cadmium plated shafts. Panel space required: Type C, 5 1/2" wide x 5 3/8" high; Type D, 4 1/4" wide x 4" high.

**TYPE E and F**—For medium and low power transmitters. Maximum capacities from 35 to 500 mmfd. Breakdown ratings from 2,000 to 4,500 volts. Aluminum plates .032" thick, aluminum end frames and tie rods. Steatite insulators, rotor contacts are cadmium plated phosphor bronze. Panel space required: Type E, 2 3/8" square; Type F, 2" x 2 1/8".

Types  
E and F

## Preamplifiers

(Continued from page 36)

quency with a grid-dip meter. The tube should be inserted during this check and the slide switch placed in the "in" position.

With the preamplifier connected to the antenna and receiver, apply voltages, place the slide switch to the "out" position, and tune in a signal on the receiver. A grid-dip meter makes a good

Bottom view of the miniature preamplifier.

signal source for this alignment. Place the slide switch to the "in" position and adjust the slugs for maximum reading on the S-meter. If the receiver does not have an S-meter, the preamplifier can be adjusted for maximum signal or noise while listening to the audio output of the receiver with a pair of headphones (this eliminates outside noises). If the receiver has an S-meter, it should show an increase of 4 to 6 S-units when switching the preamplifier in. Coils have not been included for 80 and 40 meters, since most receivers operate satisfactorily at the lower frequencies and a preamplifier is not normally required.

COIL TABLE

Band	L <sub>1</sub>	L <sub>2</sub>	L <sub>3</sub>	L <sub>4</sub>	C <sub>A</sub>

BE SAFE WITH

# Q-max

**A-27**

**LOW-LOSS LACQUER & CEMENT**

- Q-Max provides a clear, practically loss-free covering, penetrates deeply to seal out moisture, imparts rigidity and promotes electrical stability. Does not appreciably alter the "Q" of R-F coils.

- Q-Max is easy to apply, dries quickly, adheres to practically all materials, has a wide temperature range and acts as a mild flux on tinned surfaces.

In 1, 5 and 55 gallon containers.

## Bandswitching Rig

(Continued from page 41)

meter stage is too small.  $C_6$  should then be set at *less* capacitance than originally, the VFO reset to 4000 kc., and the slug in  $L_2$  readjusted for maximum grid current. If the readjustment for maximum grid current at 3200 kc. has required a *decrease* in the capacitance of  $C_6$ , the tuning range of the 80-meter stage is too great. In this case,  $C_6$  should be set initially at a *higher* capacitance at 4000 kc.

When an adjustment has been secured where the grid current remains essentially constant across the 80-meter band, the bandswitch should be turned to the 40-meter position. The VFO should be set to the low-frequency end of the band, and a high-resistance voltmeter connected

The v.h.f. filter components are enclosed in an extension added at the rear of the exciter chassis. The switch section is  $S_{2g}$ .

across the 40-meter doubler grid leak.  $C_7$  should then be adjusted for maximum voltage. This voltage should remain essentially constant over the band.

The 40-meter stage, as well as the following multiplier stages, are lined up by the same method used for the 80-meter stage. The band-set condenser is set at midrange in each case, the VFO is tuned to the high-frequency end of the band, the slug in the plate inductor is adjusted for maximum 807 grid current, and then a check made at the low-frequency end of the band, repeating the process if there is a conspicuous difference in grid current at the ends of the bands. On 21 Mc., it should be necessary to adjust only the slug of  $L_5$  after the circuit has been lined up on 14 Mc.

If parasitic oscillation occurs in the final amplifier when plate and screen voltages are applied,  $L_7$ ,  $L_8$ , and  $L_9$  should be adjusted, a turn at a time, until the parasitic is suppressed. In the multiband tuner, it is advisable to adjust  $L_{11}$  carefully so that 14 Mc. comes at maximum capacitance of  $C_{15}$ , and adjust  $L_{10}$  so that 7.3 Mc. comes with the capacitor near minimum capacitance. This procedure should result in maximum separation between fundamental and harmonic resonances.

After the steps described earlier were taken, no sign of instability could be found on any

(Continued on page 122)

## TELESCOPES CRANK DOWN TO ADJUST

The answer to your prayer — crank it up or down. Used by hundreds of hams — testimonials available. Stop it at any height 20 to 40 ft. Lower it for storms. Hinged bottom. Install it yourself. SPRING LOADED RATCHET WINCH can be padlocked. Good looking, husky, yet light.  $\frac{3}{4}$  in. aircraft steel. Hoist cable tested for 920 lbs. **\$53.50** FOB St. Petersburg

**THE DOW-KEY CO., INC.**  
WARREN, MINNESOTA

band with the rig running wide open, regardless of the setting of the tuning or excitation controls. After a high-pass filter had been installed at the input of the TV receiver to prevent overloading, no TVI could be detected on a receiver running in the same room, with a separation between antennas of only 10 feet. The rig can be flipped from band to band with no fussy adjustments and with complete freedom from "bugs" of any kind. Reports on the quality of signal have been universally excellent.

## World Above 50 Mc.

(Continued from page 62)

uled for the contest week end, September 17th and 18th. K4AMX will be operating from Mt. Mitchell, N. C. (highest point in eastern U.S.A.), on 50, 144 and possibly 220 Mc. Frequency on 2 will be 144.23, with 16-element horizontal array.

An International 2-Meter Relay is planned for the contest week end by the 2-Meter and Down Club of Los Angeles. Stations will be manned at various California high spots from the Mexican border north, but coöperation of W7s will be needed to complete the route to Canada. The northern terminal will probably be VE7FJ, in the Vancouver area.

The third-party traffic angle has been taken into consideration (we have an agreement with Canada, but not with Mexico) and if no special dispensation can be arranged for the occasion, the work from the Mexican end will be handled in such a way as to conform completely with our international obligations in such matters.

OES gang: Due to long copy this month we're holding back OES notes. Will combine two months in next issue. Reports are getting better all the time. Keep 'em coming!

# C & G HAS LOTS TO OFFER YOU!

**STOCKS:** We stock all amateur lines in equipment, kits, and parts. We have a used & surplus department loaded with all types of amateur gear. Our wide coverage of amateur and industrial customers enables us to stock those "difficult to find" items.

**W70VW**  
Irma Aufang

**PLANT FACILITIES:** The total combined storage area of the C & G stores is over 30,000 square feet, with five locations to serve you. A complete Kardex inventory system assures us of having what you want when you want it. We have our own service facilities to back up the guarantees on equipment we sell. A large free customer parking-area is just outside our HAM SHACK for your convenience.

**W7EHQ**  
Lloyd Norberg

**W7RGD**  
Dick Ryan

**CREDIT:** Again the wide variety of customers and types of accounts we do business with have made it easier for us to ascertain and accept your credit terms trimmed to your budget when you need the service. We are only too pleased to help a new ham get started or to help you realize that new receiver or transmitter through our time payment plan.

**W7NZM**  
Jim Haban

**W7DDQ**  
Ernie Blind

**EXPERIENCE:** The combined experience of the amateurs in our company totals over 80 years, OPERATING, DESIGNING and BUILDING AMATEUR EQUIPMENT. You also receive the benefit of the fellows here who are audio nuts, model builders, camera fiends and experimenters. They are all able to answer your questions in their specialties.

**W7EKW**  
Stew Tatro

**SERVICE!!** All the above qualifications add up to this extra advantage in dealing with C & G. No matter what your problem is we feel that we can help and serve you BETTER THAN THE REST.

**W7UYK**  
Ranny Gaschk

# EASY TO BUILD!

## Self Supporting STEEL TOWERS

For Rotary Beams, FM, TV

You can erect this tower yourself. Just dig four holes, set anchor posts in place, bolt the pieces together. 5 1/2 ft. ladder sections make it easy to work higher as tower goes up. It's a lot of fun to build your own tower — and saves you money, too!

### ATTRACTIVE — NO GUY WIRES!

- 4-Post Construction for Greater Strength!
- Galvanized Steel — Will Last a Lifetime
- SAFE — Ladder to Top Platform
- COMPLETE — Ready to Assemble
- Withstands Heaviest Winds

Width of  
Base Equal  
to 1/5 Height

Vesto Towers are available in a wide range of sizes to meet requirements of amateurs and commercial users alike. Note the low prices for these quality lifetime towers: 22'-\$104, 28'-\$127, 33'-\$149, 39'-\$182, 44'-\$206, 50'-\$239, 61'-\$299, 100'-\$895.

Towers are shipped to your home knocked down. FOB Kansas City, Mo. 4th class freight. Prices subject to change... so order now! Send check or money order... or write for free information. Cable address: "VESTO"

# ULTRA MODULATION NEW NEW

## A REVOLUTIONARY SYSTEM!

... Of Audio Control that permits the use of more Audio power than normal Carrier Power without causing splatter or increased bandwidth!

Modulate your carrier with all the Audio Power your rig is capable of delivering, by using: —

## THE ULTRA MODULATION UNIT!

**This Unit:—**

**PREVENTS** — Splatter or increased bandwidth normally caused by high Audio power on any rig from the Johnson Viking Class to the Collins KW-1 Class.

**INCREASES** — The efficiency of Class B linear rigs and the effectiveness of low powered rigs!

**OPERATES** — Through heavy QRM and high noise levels with the overriding effect of strong Audio!

**SIMPLE to install on any rig: — LOW in price!**  
**GET THE FACTS TODAY!**

For Information Folder, write to: —

**Ultra Modulation Company**

# HARVEY PRESENTS CENTRAL ELECTRONICS EQUIPMENT for AM, CW and SSB

## NEW BROAD-BAND Linear RF Amplifier Model 600L

The 600L has no tuning controls except a single knob selector covering all amateur bands from 10 through 160 meters. Requires only 2 watts effective or 4 watts peak envelope drive power for 500 watts dc input. New band-pass couplers provide 60 to 65% linear efficiency. Uses single 813, class AB<sub>2</sub> and has automatic relay to protect 813 and RF couplers.

New meter features include: reads input power directly in watts... reads grid current... reads output in RF amperes... shows reflected power due to mismatched load... input level calibrations for AM, PM and CW. Function selector knob switches meter to any reading while transmitting.

Has built-in power supply with excellent regulation of bias and screen voltages. The 600L is effectively TVI-suppressed with thoroughly shielded and bypassed RF compartments.

Available in either table or rack model.

Complete (factory-wired).....\$349.50

## New MULTIPHASE 'Q' MULTIPLIERS

A tunable IF electronic filter that provides tremendous receiver selectivity for peaking or rejecting signals on AM, CW or SSB. Employs new 2-tube circuit with high-Q inductor. Continuously variable from 60 cps to normal IF pass-band. Interfering carriers attenuated up to 50 db.

AQ

DQ

**Model AQ** — Designed for installation in Model A Slicer. Includes new front panel. Power-IF cable plugs into accessory socket.

Kit.....\$22.50  
Wired.....29.50

**Model DQ** — Designed for use with any receiver with 450 to 500 kc IF. Has power-IF connecting cable. Power requirements are 225-300 vdc at 12 ma and 6.3v at .6 amps. Can provide additional selectivity and BFO for mobile SSB or CW reception.

Kit.....\$22.50  
Wired.....29.50

## SIDE BAND SLICER Model A

Permits selectable SSB reception on any receiver with 450-500 kc IF. Cuts QRM and reduces interference from 15 kc TV harmonics. Has built-in power supply.

Kit.....\$49.50  
Wired.....74.50

**AP-1 ADAPTER** — Plug-in IF stage for use with Slicer. Allows receiver to be switched from SSB to normal.

Wired.....\$8.50

**AP-2 ADAPTER** — Combines AP-1 and crystal-mixer for use with receiver having 50, 85, 100, 915 kc or other IF systems.

Wired.....\$17.50

## SIDE BAND SLICER — Model B

Complete Sideband Slicer same as Model A, but including built-in 'Q' Multiplier. Does not require AP-1 Adapter.

Kit.....\$69.50  
Wired.....99.50

**Harvey Ships Everywhere  
in the World!**

## Model 20A MULTIPHASE EXCITER

20 watts peak envelope output on AM, PM, CW, and SSB. Has single switch for side-band selection... VOX on AM, PM and SSB, plus break-in operation on CW... bandswitching, 160 through 10 meters... magic eye indicator for carrier null and peak modulation... plus many other features. Choice of table or rack model.

Kit.....\$199.50  
Wired.....249.50

## Model 10B MULTIPHASE EXCITER

10 watts peak envelope output—AM, PM, CW and SSB. Uses plug-in coils. Improved version of earlier 10A.

Kit.....\$129.50  
Wired.....179.50

**Write for HARVEY's  
1955  
HAM CATALOG  
IT'S FREE!**

## Model QT-1 ANTI-TRIP UNIT

All-electronic VOX break-in anti-trip unit for use with loudspeaker. Prevents loud signals, heterodynes, etc. from tripping voice break-in. Plugs into socket of 20A or 10B Exciter.

Wired.....\$12.50

## 458 CONVERSION KIT

Basic 458 conversion parts kit, 15 to 160 meters with dial, etc.

Kit.....\$15.00

**Case and Panel Kit** for 458 conversion.....\$10.00

## New — For 10 Meters Model 458-10

Crystal-controlled converter package to extend 458 VFO into 10-meter band. For use with 458 Conversion Kit.

Kit.....\$27.50  
Wired.....37.50

## NOW READY! — THE NEW & IMPROVED

### Completely Bandswitching 500-A GLOBE KING

Here's an advanced design, high power transmitter of 500 watts input on both CW and fone 100% modulated. Is completely bandswitching 10 thru 160M. bands. Consists of RF, Speech Modulator and Dual Power Supply Sections. Entire unit is specially screened for TVI. Pi Network output matches any antenna from 52-600 ohms. Has provisions for VFO and Single Sideband input. Forced air-cooled 4-250A tube, push-to-talk, special aluminum mesh screening of RF Section — just a few of the many fine features. Enclosed in grey hammertone cabinet, 31"x 21 1/4"x15".

**ONLY \$367<sup>8</sup>** per mo.

**\$67.50 DOWN**  
CASH PRICE: \$675.00

## Happenings

(Continued from page 47)

limits of 800-900 cycles. No major difficulty  
having been disclosed by a preliminary examina-  
tion, the petition has now been filed as follows:

### FEDERAL COMMUNICATIONS COMMISSION

Petition for amendment of Paragraphs 12. 107(c)  
and (d) of the Rules Governing Amateur Radio  
Service, titled "Special Provisions Regarding Ra-  
dio Teleprinter Transmissions."

#### Petition of the American Radio Relay League, Inc.

The American Radio Relay League files this petition on  
behalf of the more than 47,000 U. S.-licensed amateur  
radio operators who are members of the League.

This petition was formulated pursuant to instructions  
of the Board of Directors of the League.

The League proposes that the present restriction on fre-  
quency-shift keying in the amateur service, now 800 to 900  
cycles shift, be removed and that instead there be permitted  
any shift under 900 cycles. Specifically, the League proposes  
that Section 12. 107(c) of the amateur rules be amended  
to read as follows:

(c) When frequency-shift keying (type F-1 emission)  
is utilized, the deviation in frequency from the mark  
signal to the space signal, or from the space signal to the  
mark signal, shall be less than 900 cycles per second.

and in consonance therewith, that Section 12. 107(d) be  
amended to read as follows:

(d) When audio-frequency-shift keying (type A-2 or  
type F-2 emission) is utilized, the highest fundamental  
modulation audio frequency shall not exceed 3000 cycles  
per second, and the difference between the modulating  
audio frequency for the mark signal and that for the  
space signal shall be less than 900 cycles per second.

This proposal is based on the following considerations:

#### Experimentation

In recent years, with the availability of teleprinters to  
the Amateur Service, a number of experimentally-inclined  
amateurs have been using radioteleprinter communication,  
first with audio-frequency-shift keying primarily on the  
14-Mc. band and, since the Commission's authorization  
for the use of F-1 emission on lower-frequency bands, with  
carrier frequency-shift-keying in the non-voice portions of  
the 3.5-, 7-, and 14-Mc. bands. Although at one time the  
number of available printer units sharply limited the  
number of amateurs who could engage in this work, at  
present there is an adequate supply of such units with the  
result that amateur use of F-1 teleprinter communication  
is increasing rapidly. The League believes that this is  
another field in which the amateurs can contribute to the  
advancement of the art, but amateurs are now handicapped  
with the limitation of frequency shift within the range  
800-900 cycles per second. A number of leading amateurs  
in this field have indicated a strong interest in conducting  
experimental communication with lesser frequency shift,  
and the League believes they should be encouraged to do  
so. It is understood that commercial and military research  
groups also feel that a shift of considerably less than the  
present 850-cycle standard may well be found to be much  
more effective in teleprinter communication. The League  
urges the Commission to permit amateurs to take part in  
this investigation.

#### Improvement in Techniques

A reduction in permissible frequency shift will allow the  
use of receivers with narrower bandwidth, resulting in an  
improvement in signal-to-noise ratio. It will be possible to  
sharpen intermediate-frequency filters and amplifiers. It  
is also expected that a reduction in frequency shift will  
lessen the effects of selective fading, since this problem is  
eased when mark and space signals are brought closer to-  
gether. A smaller frequency shift is also more easily obtain-  
able when using crystal control, compared to the present  
difficulty of achieving direct 850-cycle shifts with 3.5-Mc.  
crystals.

#### Reduction in Interference

Although this is a matter of lesser importance, it should be  
mentioned (if only to point out that potential interference

(Continued on page 130)

## TRANSISTOR TRANSFORMERS

AT LAST A COMPLETE LINE OF QUALITY TRANSFORMERS FOR EVERY TRANSISTOR APPLICATION AT A PRACTICAL PRICE!

**2.75 each**  
Lots of 10 Assorted  
**2.95** Singly, each

• Nickel-Steel and Silicon Steel Laminations  
• Wound on Nylon Bobbins  
• Color Coded Leads  
Have you been experimenting with transistor circuits? And have you been forced to make-do with compromise transformers or improvised units? And have you had to pay from \$6.00 to \$12.00 for them? The Argonne line brings you a wide variety for experimentation as well as for replacement. Efficiently designed to meet the needs of miniaturization and engineered to provide more power handling capacity and improved frequency response with minimum distortion. All are nickel-steel laminations except asterisk which are silicon steel. Average net weight 1.3 oz. average shipping wt. 4 ozs.

## INSTRUCTOGRAPH COMPANY

4709 SHERIDAN ROAD, CHICAGO 40, ILLINOIS

to other types of emission in these amateur bands will certainly not be increased) that it is expected the use of a lesser frequency shift will accomplish a reduction in interference. Since, practically speaking, an F-1 signal uses the spectrum space of a c.w. signal with corresponding on-off keying, plus the frequency shift, it is apparent that a smaller shift will occupy less spectrum space and thereby provide less opportunity for interference.

\* \* \*

In summary, the League believes that authorization for amateurs to employ F-1 emission frequency shifts less than 900 cycles per second will permit more extensive experimentation with radioteletypewriter communication, will result in an improvement in and simplification of teletypewriter techniques, and thereby will provide a more reliable means of communication.

AMERICAN RADIO RELAY LEAGUE, INC.

By PAUL M SEGAL

QUAYLE B. SMITH

Its Attorneys

A. L. BUDLONG  
General Manager  
July 6, 1955

### MINUTES ERROR

A typographical error appears in the 1955 Board meeting minutes in July *QST* (paragraph 59). Mr. Cowan of the West Gulf Division, not Mr. Gowan of the Dakota Division, is the third member of the Finance Committee. Mr. Gowan is, as reported in paragraph 65, on the Membership & Publications Committee.

### Operation Alert

(Continued from page 51)

official who could not be contacted by telephone. W3AVL and W3ZZK relayed traffic via 2 meters to WN3ZYB in Calvert County. Eighteen c.d. messages were handled during the alert. Participating amateurs received congratulations from the county Civil Defense Director for the manner in which these messages were handled.

### Massachusetts

In Winthrop, EC and RO W1BB alerted his group to participate on the basis that radio was the *only* means of communication. Both control and alternate control stations were operated, on six meters. The test was conducted on an area basis, although local stations were ready and standing by.

Acting EC and Radio Officer W1WGN reported some confusion in New Bedford as to whether the city was to be bombed or not. Nevertheless, amateurs participated wholeheartedly. The control station was operated from 1200 to 2145 by five amateurs to maintain contact with sector headquarters, with mobiles in New Bedford and the center of the city. Ten and two meters were used.

Sector 1-B, which includes 21 cities and towns in Eastern Mass., was activated from Quincy City Hall by nine amateurs. Seventeen towns reported into the nets on ten and two meters. Net control W1IA was on the air from 1130 the 15th until 1330 the following day.

EC and RO W1SPF of Worcester reports participation by five amateurs and two non-amateur operators. The city was "bombed" at 1428, smashing all communications in Worcester, leaving only one control center and two mobiles in operation. Those left had a mighty hard time of it, demonstrating that additional and more dispersed facilities are needed.

Sector 1-C was alerted at 1800 and was on the air until 2300. Traffic was handled regarding food shortages for the evacuees who had been moved from Boston to Framingham. Communications from Framingham to sector headquarters in Sherborn was on 50,745 kc. The Sector 1-C RO is W1ZOP, the EC W1MEG. The latter is also alternate radio officer and sent us this information.

Waltham EC W1JSM reports that they were alerted for control center and zone base action from 1800 to 2300 on the 15th. Four amateurs were active. The local net tied in zone bases to the control center.

## Michigan

Although not yet authorized for RACES, the AREC gang at Sault Ste. Marie was active. W8NTD, the Twin Sault Radio Club's station,

This station was set up in the basement of the FCDA Building in Battle Creek, Mich., to provide contact with Goguae Lake Naval Training Center during exercises connected with Operation Alert in FCDA's Region IV. That's W8YAN at the mike, while W8SSH monitors a receiver.

was on the air for help in relaying traffic. The mobile control station, located in a specially-built bus, was supported by four mobiles for local operations, with seven other operators participating. Communications between the two Saults in Michigan and Ontario were conducted on ten meters.

## Johnson Viking

### ADVENTURER CW Transmitter Kit

**COMPLETELY SELF-CONTAINED!** Power input — 50 Watts • Effectively TVI suppressed • Pi-network output tuning — no antenna tuner needed • Single knob Bandswitching on 80, 40, 20, 15, 11, 10 meters • COMPACT! 7 3/8" high x 10 3/8" wide x 8 1/8" deep. No. 240-181-1 VIKING ADVENTURER KIT, with tubes, less crystals and key. Complete with easy assembly and operating instructions. **\$54.95**

## SENSATIONAL VALUE!

### PIONEER Mobile POWER SUPPLY

This 6 Volt Mobile Power Supply has one of the finest and most effective filter systems of any we have had the pleasure to offer. The top-quality Pioneer Dynamotor and rugged commercial construction, along with the low price adds up to **VALUE PLUS!** The filter section contains three husky iron core chokes and two RF chokes, all with seven oil condensers to effectively filter both A and B, and RF hash. There are absolutely no electrolytics used. Input and output are terminated in a standard 6-prong Cinch-Jones #406AB socket. At the nominal input voltage of 5.5 Volts DC, it delivers 400 Volts at 175 Ma. Continuous duty; 250 Ma. easily at intermittent use. With storage battery up to snuff and husky A leads, output runs about 440 Volts. Base — 6" x 9 3/4" and 17" high.

2 Meter Linear R. F.  
Power Amplifier

**a 10 Time  
increase  
In Output Power**

Model  
No. 3063

Quickly... Safely... Economically provides carrier power output at 50-60 watts with a modulated driving source of only 4-5 watts, a requirement met readily by the well-known GONSET 2 meter Communicator.

#### Features:—

Automatic operation; switching Communicator, or other driver, to "Transmit" automatically activates the amplifier and antenna change-over relay...  
Output amplifier uses two, 826 VHF triodes, push-pull connected, with FORCED AIR COOLING...  
Heavy duty, self-contained 115 volt AC power supply utilizes two 5U4GB rectifiers in a voltage doubling circuit...  
Complete with tubes.....Net **\$149.50**

### JEEP WHIP ANTENNA

Extends to 82" • Closes to 14" • U.S. Govt. antenna for mobile use on 2-6-10, 11 meters • Removable mast, can base load for 20-40-75 meters. Solid brass, Type AN75D. Shipping Wt. 4 lbs.

**Each \$1.89**

3 for \$5.00

Multi-Purpose LINEAR  
6 Band

### R. F. POWER AMPLIFIER

For SSB...CW...AM PHONE

**Model No. 500W** Here is a complete, ready-to operate RF linear Amplifier with single control bandswitching for six amateur bands. This extremely stable output stage, operating in Class AB<sub>1</sub>, provides very substantial power output with low grid drive. Excellent linearity and extremely low harmonic content in the pi network output circuit are other important features.

• SSB — 250-300W P.E.P. Output • Pi network output for 50-300 Ohm loads • one knob bandswitching covering 10-11-15-20-40-80 meters with provisions for 160 • self-contained heavy duty power supply • excitation control • complete metering • screen protection overload relay • completely free from parasitics or self-oscillation • excellent linearity on SSB or AM.  
Complete with tubes—now reduced to only **\$339.00**

## AMECO LOW PASS FILTER

The AMECO low pass filter suppresses the radiation of all spurious signals above 40 Mc. from the transmitter. The filter uses a Constant K Circuit, and is designed for Coaxial cable (52 to 72 ohms). Other features include:

- Negligible Insertion Loss • 35 Db and more attenuation of harmonic & spurious frequencies above 50 Mc. • Will handle up to 200 watts of RF power • Each unit complete with bracket, and instructions

**\$1.95** Amateur net

Model LN1 with 2 RCA phone jacks ..... **\$1.95**  
Deluxe Model LN2 with 2 SO-239 Coax. Connectors ..... **\$3.45**

## HIGH PASS FILTER

The AMECO high pass filter is placed in series with the TV receiver's antenna to prevent the transmitter's signal from entering the receiver. All frequencies above 45 Mc are passed through without loss. The AMECO high pass filter is designed for use with the common 300 ohm twin line.

Model HP-45

### OTHER FEATURES INCLUDE:

- 40 db and more attenuation at 14 Mc. and below; 20 db attenuation at 10 meters.
- Negligible insertion loss
- Filter uses balanced constant K circuit

At the amazing low, low price of **89¢** Amateur Net

## New Jersey

Maplewood EC W2COT reports sixteen stations on stand-by, of which five were mobile, but no local incidents were attempted.

## New York

K2DVC, EC and RO of Genesee County, N. Y., combined his RACES and AREC operators for a successful RACES test on RACES frequencies. K2IDQ set up his rig at c.d. headquarters. Activity commenced shortly before noon on the 15th and continued until 1022 the 16th. Ten and six meters were used. Everything went off fine, says K2DVC, and the c.d. director was very pleased and impressed.

## Ontario

VE3AIB took over in Operation Alert due to the absence of the regular communications officer (and Toronto EC) VE3IL. Operation was conducted on 80, 75, 40, and 2 meters, concerned primarily with traffic direct between the various regional headquarters and provincial headquarters at Toronto. Most regions also operated their own amateur nets on other frequencies. This set-up worked very well during the hours 1800 to 2300 EST on the 15th.

## Pennsylvania

Philadelphia County's Operation Alert was primarily concerned with evacuation procedures. Four sample evacuations were conducted, one from each of the city's four c.d. regions. Communications with the caravans were maintained at all times to the respective regional control centers on 29 Mc. A Navy blimp carried civil defense observations, communications with Philadelphia's Mobile Communications unit being conducted on RACES frequencies under the call K2NBD. The mobile unit operated as W3YXU/3. This mobile unit also maintained contact with the four control centers on 29 Mc. The turnout was large and very encouraging. EC W3DYL lists 41 amateurs and 10 amateur/RACES mobiles participating.

## Puerto Rico

Puerto Rican amateurs participated in Operation Alert through their club station KP4ID, located at c.d. headquarters in Rio Piedras. This station was on the air from 0800 through 2030 on June 15th. Operation was on 3925 kc. Sixteen stations on Puerto Rico and the Virgin Islands checked in, handling 53 messages. Stations were also located at Gurabo C.D. Headquarters and Ramey Air Force Base, the latter maintaining contact with FCDA Regional headquarters in Thomasville, Georgia. A total of 22 amateurs participated.

## Tennessee

Five amateur stations were set up and operating in Chattanooga when the yellow alert was sounded on June 15th, according to newspaper clippings sent us. J. D. Rivers was in charge of

**PAGE COMMUNICATIONS  
ENGINEERS, INCORPORATED**

710 Fourteenth Street, N.W.

Washington 5, D. C.

the RACES group, maintaining communications with other cities in the state. More than 50 operators participated, and amateurs supplied their own equipment.

Eight emergency-powered rigs were used by the Oak Ridge gang over a 24-hour period. SEC W4RRV was present at c.d. headquarters, along with the city manager and c.d. director. All transmitters were of home construction.

### **Virginia**

The Hampton RACES organization, under EC W4AJA and RO W4RGN, provided the nucleus for Operation Alert in the Hampton-Newport News-Warwick area. Nine amateurs staffed the control station in Hampton, while W4AJA acted as alternate control. Local units were not alerted, the tricities set-up acting in support of Norfolk, the target area. Sixty-five official messages were handled.

No previous planning was made in Norfolk, but 32 amateurs responded to the alert, 20 of whom were mobile. Assignments were made on the air or in person after the alert. At 1545 all mobile and portable stations were called in for regrouping and reassignment. Most traffic from then on was directed to Richmond (state control). A total of 99 messages were handled. The boys had their transmitter and antenna troubles, but the drill went off successfully.

The Falls Church RACES net held their own exercise on 29,580 kc. RO W4OP operated the control station, and mobiles were stationed at check points on evacuation routes. Four mobiles and four fixed stations participated, handling nine messages without difficulty. C.D. headquarters RACES station in Fairfax was covered by mobile W4TNQ, with W4ZNU assisting, maintaining communication with Falls Church on 145.3 Mc.

### **Conclusions**

The first, and most obvious, conclusion is that a great deal more activity was conducted than has been reported above. We can report only the information we receive. Secondly, we congratulate and commend *all* who participated, whether an authorized or pending RACES group, on their representation of amateur radio in this very important national activity very much in the public eye. Thirdly, and last but not least, we want to point out to those who operated outside RACES frequencies (although they undoubtedly already know it) that they are conducting tests that are almost totally unrealistic in view of the certainty that *only RACES frequencies under RACES* will be available after any commencement of hostilities. It doesn't matter, unfortunately, that these frequencies are not sufficient for our needs. Until or unless additional frequencies can be made available, we have to plan to use the ones we have.

Thanks to those who reported for making it possible for us to give some idea of participation by amateurs in civil defense throughout the nation.

## New Apparatus

### Radioteletype Filter Set

One of the stumbling blocks to RTTY operation has been the receiver-converter filters used to separate the "mark" and "space" signals, and amateur "scrounging" of one type or another has usually been the only recourse. This situation has been improved by the recent availability of the BF-M1 and BF-S1 Radioteletype Filters. These compact ( $4\frac{3}{8}$  by  $2\frac{3}{8}$  by  $2\frac{1}{2}$  inches high) units have the characteristics shown in the manufac-

turer's curves below, and an application sheet accompanying each filter shows a practical circuit in which the filters can be used. The characteristic impedance of each filter is 600 ohms, and the insertion loss is 2 db.

The BF-M1 and BF-S1 Filters are manufactured by D & R, Ltd., 402 East Gutierrez St., Santa Barbara, Calif.

— B. G.

## Strays

BCI and TVI are (alas!) familiar terms, and by no means amusing. But here is a collection of interference abbreviations, turned up from QST files, that are surely novel and in some cases downright strange:

- GDI — Garage door interference
- BTI — Bath tub interference
- WPI — Water pipe interference
- OAI — Organ amplifier interference
- HAI — Hearing aid interference
- SPI — Stove pipe interference
- MPI — Motion picture interference
- RPI — Record player interference
- PAI — Public address interference
- ESI — Electric stove interference

Now all we need is **NMI** — *no more interference!*

P.O. BOX 312

CONCORD, N. H.

**U. S. N. R.**

**R**EAR ADMIRAL HENRY C. BRUTON assumed duties as Director, Naval Communications, on 1 April 1955, succeeding Rear Admiral William B. Amon who was assigned command of BATDIV TWO.

In his new assignment, Admiral Bruton is returning to the field of communications in which he served during the early part of his naval career following his graduation from the U. S. Naval Academy in 1926. He is holder of an amateur

radio license (since 1920), a degree in radio engineering from the University of California, and a law degree from George Washington University.

A large part of his career has been in the submarine service. During World War II, as commanding officer of the USS *Greenling*, he completed four successful submarine patrols, credited with a total of 11 sinkings. He also participated in the Korean hostilities as commanding officer of the USS *Wisconsin*.

Admiral Bruton's assignments have included Administrative Aide to Fleet Admiral Chester Nimitz when he was Chief of Naval Operations, and Aide to Fleet Admiral Ernest J. King when he was Commander-in-Chief, U. S. Fleet. From June, 1953, to September, 1954, he was Commander of the Navy task group at the Bikini atom bomb tests, and then was named Deputy Chief of Naval Operations (Administration).

Admiral Bruton holds several military awards, including the Navy Cross. He is a member of the ARRL. His present call is W4IH and although he is now inactive on the ham bands, he periodically threatens to open up again any day.

**SWITCH  
TO SAFETY!**

If you operate a kilowatt, or ever plan to—buy your Kilowatt "Matchbox" today. Use it with any lower power unit and switch to maximum power later.

**NEW**

# KILOWATT "MATCHBOX"

• Bandswitching • Self-contained • Performs all transmission line matching and switching functions required in the high power station

Now, quickly, easily . . . load and match balanced and unbalanced lines over a wide range of antenna impedances at the kilowatt level. Single knob bandswitching, front panel tuning and matching—no coil changing or tapping necessary. Matches unbalanced impedances from 50 to 1200 ohms—balanced impedances from 50 to 2000 ohms—tunes out large amounts of reactance as well.

Equipped with a heavy duty antenna changeover relay, the Kilowatt "Matchbox" permits separate matching of the antenna to the receiver and also has provision for muting the receiver when transmitting. An electronic time delay circuit prevents arcing of the relay contacts and provides protection for the transmitter components from undue stress of momentary high voltage surges during changeover. Nominal input impedance is 52 ohms—may be used with any transmitter operating up to and including 1000 watts.

Amateur Net

TWX-MM 186X (FRANK W4ICE)  
CABLE ADDRESS: ELSUPPLY

# COMPLETE STATION (only 25" wide by 13-1 2" high) SYSTEM ENGINEERED by Harvey-Wells

Yes, really complete—all ready to connect antenna and AC line. T-90 TRANSMITTER is 90 watts CW, 75 watts phone. R-9 RECEIVER is 9 tube, double conversion with approximately 6" of dial spread on all bands. Z-MATCH is a continuous tuning antenna coupler, with dummy load, R. F. Wattmeter and Standing Wave indicator features. And the price? Amazingly low for so much quality!

See this equipment at your supply house today, or write for descriptive literature, including power supplies for both mobile and fixed operation.

## MAMMOTH CRYSTAL CLEARANCE SALE!

Save Money—Order in  
Package Quantities!

Shipment made same day order received. All crystals tested and guaranteed to oscillate. Please include 20c postage for every 10 crystals or less. Minimum order \$2.50. No. C.O.D's.

## JOHNSON ALL-WEATHER ANTENNA ROTATOR AND PARASITIC BEAMS

Designed to rotate heavy multiple arrays even under icing conditions or high wind loading. Rotates  $1\frac{1}{4}$  RPM—full  $360^\circ$  either direction—over-all gear reduction, 1200 to 1. Heavily chrome plated slip rings • cast aluminum rotator housing •  $5/16"$  steel rotating table • unit hinged to tilt  $90^\circ$  for beam adjustment—can be rotated in tilted position. Mounting area required:  $11" \times 14"$ .  
Cat. No. 138-112 Rotomatic Rotator with attractive desk top selsyn control box, for 115 volt, 60 cycles.

**\$32400**  
Amateur Net

### BEAM KITS

Rugged, parasitic beam antennas for 20, 15, and 10 meters. High gain—easy to erect, simple to adjust. Booms are  $2"$  galvanized steel tubing, elements are of strong aluminum alloy. Heavy duty galvanized steel clamps will not work loose yet provide adjustable element spacing. Angle feet welded to boom for sturdy mounting. Adjustable "T" or "Gamma" matching assembly included with element kits.

Order from your electronics parts distributor.

## E. F. JOHNSON COMPANY

2829 SECOND AVENUE SOUTHWEST • WASECA, MINNESOTA

## when DISASTER strikes, you need **PORTABLE 2-WAY RADIO**

Civil Defense Authorities know that most radio equipment in disaster areas will be inoperable for lack of power. Mobiles, blocked by debris and traffic, will be unable to reach important communication centers. Bulky, built-in mobile units cannot be readily transferred.

The answer, then, is the use of compact, portable equipment both self-powered and capable of operating from any available current source.

Industrial Radio 2-Way Pak-Fones are the newest, most efficient designs in portable radio.

There's a model for every CD application—each approved for FCDA matching funds.

When considering radio equipment, be sure to ask for a demonstration of Pak-Fones in your own community. Field tests consistently prove their superiority in range and convenience of operation.

### Model A PAK-FONE

Operates on self-contained batteries, 6 or 12 volt storage batteries or 115 volts A.C. Loudspeaker FM reception. 8 Tube transmitter. 15 Tube dual conversion superhet receiver. Built-in power supply.

Write for circular on Model A and the new Model J Mobile.  
—Fixed Pak-Fone.

# HAM-ADS

(1) Advertising shall pertain to radio and shall be of nature of interest to radio amateurs or experimenters in their pursuit of the art.

(2) No display of any character will be accepted, nor can any special typographical arrangement, such as all or part capital letters be used which would tend to make one advertisement stand out from the others. No Box Reply Service can be maintained in these columns nor may commercial type copy be signed solely with amateur call letters.

(3) The Ham-Ad rate is 30¢ per word, except as noted in paragraph (6) below.

(4) Remittance in full must accompany copy. No cash or contract discount or agency commission will be allowed.

(5) Closing date for Ham-Ads is the 20th of the second month preceding publication date.

(6) A special rate of 7¢ per word will apply to advertising which, in our judgment, is obviously non-commercial in nature, and is placed and signed by a member of the American Radio Relay League. Thus, advertising of bona fide surplus equipment owned, used and for sale by an individual or apparatus offered for exchange or advertising inquiring for special equipment, if by a member of the American Radio Relay League take the 7¢ rate. An attempt to deal in apparatus in quantity for profit, even if by an individual, is commercial and all advertising by him takes the 30¢ rate. Provisions of paragraphs (1), (2) and (5), apply to all advertising in this column regardless of which rate may apply. To expedite handling of your copy please state whether you are a member of ARRL.

(7) Because error is more easily avoided, it is requested signature and address be printed plainly. Typewritten copy preferred, but handwritten signature must accompany all authorized insertions.

(8) No advertiser may use more than 100 words in any one issue nor more than one ad in one issue.

*Having made no investigation of the advertisers in the classified columns, the publishers of QST are unable to vouch for their integrity or for the grade or character of the products or services advertised.*

PERFORATED Aluminum sheet, .051, 5/64" OD Holes, 3/4" centers, \$1.20 sq. ft.; cut to size. Send for listing on beams, aluminum tubing, etc. Radcliff's, Fostoria, Ohio.

USED equipment available from the largest inventory of this type in the East. Here are a few samples: Gonset 10-11 converter, \$24.95; Triband, \$29.95; 300W, \$24.95; Super-ceiver, \$89.95; Hallcrafters S-22R, \$39.95; S-38, \$29.95; SX-43, \$129.95; SX-62, \$250.00; SX-96, \$199.95; HT-20, \$150.00; Johnson Mobile, \$249.95; Viking I with push-to-talk, \$199.95; Viking I TVI-suppressed, \$249.95; Ranger, \$215.00; VFO, \$44.95; Viking II, \$275.00; National HF5, \$99.95; HRO-M, \$99.95; HRO-501, \$350.00; HRO-5TA1, \$175.00; NC-46, \$59.95; NC-88, \$89.95; NC-100N, \$75.00; NC-183D, \$295.00; SW-54, \$34.95; Collins 32V1, \$395.00; 32V2, \$450.00; 32V2, modified, \$495.00; many others. For latest complete list write Carl, WIBFT, Evans Radio, Concord, N. H.

SELL: Collins 75A-2, \$295; 310C, \$125.00; Dumont #241 'scope, \$225; 32V2, \$195.00; 12,000 ohm relays, 110 VAC dials, \$1.75; Teletype equipment, Collins 301, \$275.00; Waco APR-4 receiver and tuning units, ARN-7, ART-13, Tom Howard, WIAFN, 46 Mt. Vernon St., Boston 8, Mass. Tel. Richmond 2-0916.

FOR Sale: Radio Craft-Radio Electronics, 1947; Sept.; 1948, Feb.-Oct.; 1949, Jan., Feb., March, April, May, June, July, Aug., Dec.; 1950, Jan., Feb., March, April, May, June, July, Aug., Dec.; 1951, Feb., Nov., Dec.; 1952 and 1953, all 12 issues. Some have torn covers but all are complete. Radio News-Radio & Television News, 1944, Jan., Mar., June, Sept., Oct., Nov.; 1945, June, Aug., Dec.; 1946, Jan., Nov., Dec.; 1948-1951 incl., every issue except Dec. CO; 1947, Aug., Oct., Dec.; 1948, Jan., Feb., March, April, May, June, July, Aug., Oct., Dec.; 1949-54 incl., every issue except Dec. CO; 1955, Jan., July. Perfect condition. 20¢ per copy. Cecil G. Baumgartner, Box #43, Milton, Penna.

TROUBLE Getting out? Put a punch in your signal the easy low-cost way. Look! Loopen wire folded dipole antennas. \$4.95 and up. Write for free literature. R. J. Buchan Co., Briceley 4, Minn.

ELECTRONIC Blanket controls, 3 tubes, filament transformer, plate relay, resistors and condensers, in plastic case with cord, \$2.50 each postpaid. Dozen lots, \$2.00 each postpaid. John Randolph, W4QA, P.O. Box 2158, Asheville, N. C.

SELL: RME VHF2-11 asherhet 14 tubes for 2-6-10-11, excellent, \$65.00; Link police car transmitter, untouched, excellent, \$30.00; Stancor ST-202-A table top CW 100 watt package complete. Pictures. Brush tape recorder HK-401, excellent, \$100.00; Collins 32V2 including FM adaptor, exciter, \$465.00; modulator chassis 500 watt including two 810s, bargain, \$5.00. W2ADD.

AC Generators and plants, Katolight, Winpower and Pioneer. Discounts to amateurs and CD. E. T. Ballou, WIGED, Box 224, Wayland, Mass.

FOR Sale: Kilowatt transmitter 2-30TLs, final 2-304TLs, modulator 2 Hi-Voltage power supplies; Lambda Modulation 'scope, exciter and speech amplifier, Supreme AF-100 with 4-65A output. Pictures on request: \$495.00. Also have for sale Johnson Ranger, in like new condition. Less than a year old: \$195.00. Col. M. B. Chatfield, Redstone Arsenal, Huntsville, Ala.

MODERNIZE Now! Highest trade-in allowance ever offered. Top-notch used equipment at lowest wholesale prices anywhere. Write right now about any gear you want, new or used. Marshall Electronics, 855 Burlington, Frankfurt, Indiana.

WANTED: Monoscope tube, any age. Pat Blaney, New Straitsville, Ohio.

COLLINS 310B-1 exciter VFO, all bands, \$165.00; National NC-183 receiver, NFM-83, speaker, recently factory-serviced, \$175.00; Select-O-Ject, power supply, \$18.50; Meissner signal shifter TVI suppressed, coils, \$20.00; loads panel meters, tubes, filter chokes and condensers, small, medium power transformers. Everything in top condition. F.o.b. Indianapolis. Request free details listing. Howard Severid, W9DPL, 2431 E. Riverside Dr., Indianapolis 23, Ind.

COLLINS 32V-3 in excellent condition, \$525.00. George Sperry 108 Oak Hill, Portsmouth, Va.

FOR Sale: Bendix TA-12, 150 watt transmitter and AC power supply, VFO, handswitching, 20-40-80 meters, Pi network output, TVI suppression, \$50.00. W0ATP, Thelemann, 6210 W. 76th Place, Overland Park, Kansas.

SHACK-CLEARING sale: 40-foot steel windmill tower, \$40.00; SHACK-100, 10-meter beam, \$20.00; PE-103, kilowatt coils, \$2.00 each; 2500, 5-volt 10-amp, 12,000 volt insulated blank new in crate, \$25.00; 304-TL, \$3.00; BC-455, \$5.00; 6VDC generator, \$18.00; Viking Matchbox, \$17.00; everything in perfectly new condx. W00MH, R.F.D. #2, Hastings, Nebraska.

SELL: 300 W. Meissner 50B transmitter, 80 thru 10M, complete with VFO CW-Phone, time delay relays, B&W coil, \$220.00. Re-ceiver NC-100ASD, 1400 Kc. to 30 Mc., \$50.00; HE-10 & 20, \$50.00. W4PKR, Valleau, Princeton, Ky. Tel. 2689-2247.

WANTED: Panadaptor, Hallcrafters SP-44 or Panoramic. Mel Malley, W0SRU, 2251 Depew St., Edgewater, Colo.

FOR Sale or trade: S40A, Gonset, 3-30 converter, Balun coils, Kodak Pony 135; Need: Johnson Matchbox, W0RFL, 345 W. 9th St., Fremont, Neb.

SELL: Heathkit AT-1 transmitter, antenna coupler and VFO, \$50.00. Alan Steger, K2SVH, Box 97, Huntington Station, N. Y.

RADIO Club needing 16 mm sound movie projector with complete accessories. Can obtain rebuilt machine at big bargain from professional movie machine operator. ARRL member. Contact: Projectionist, Unique Theatre, 3645 East 1st St., Los Angeles 63, Calif.

WANTED: BC-610E, BC-614E, BC-939, BC-312, BC-342, JB-60 & 70. Highest price paid. USECO, 2811-16th Street NE, Washington 18, D.C.

FOR Sale: Perfect working condition: TVI-suppressed, commercially built 500 watt phone c.w. xmtr, complete with 866s splitter suppressor, variac-controlled power supply, modulator (pair 811As), Miller 90991 final (812As); Millen 90800 exciter, all in new deluxe 6 ft. locked door Par-Metal cabinet, with rack on casters. Plug-in coils, all bands, also Collins VFO 310C2 with built-in power supply. Stromberg-Carlson speech amplifier and Harrison 500 watt antenna tuner with all coils. First bid \$460.00. W1UWB, Julian Sobin, 83 Arnold Rd., Newton Center 59, Mass.

FOR Sale: Hammarlund SP-400N in like new condx: \$250. Dr. Stephen R. Fromm, 35 Revere St., Boston 14, Mass.

WANTED: Complete used 12 v. mobile rig in gud condx or used Gonset Communicator. Contact Ronnie Gann, W1FGF, c/o ARRL, 38 LaSalle Rd., West Hartford 7, Conn.

QDP? Use Stick-Tack. See page 141. The Radio Stationers.

## The No. 90901 One Inch Instrumentation Oscilloscope

Miniaturized, packaged panel mounting cathode ray oscilloscope designed for use in instrumentation in place of the conventional "pointer type" moving coil meters uses the 1" 1CP1 tube. Panel bezel matches in size and type the standard 2" square meters. Magnitude, phase displacement, wave shape, etc. are constantly visible on scope screen.

# HOW TO CONVERT YOUR RECEIVER

FOR

- True single-signal reception on CW
- Selective sideband reception on AM
- Superb performance on SSB

Model 370

**B&W**

Single Sideband Receiving Adapter

Here . . . for the first time . . . is a truly selective bandpass type adapter for bringing the performance of yesterday's receivers up to the requirements of tomorrow! In addition to superlative performance on SSB, this unit offers true single-signal CW reception and selective sideband reception on AM phone signals.

Designed by B&W's single sideband engineering group, the Single Sideband Receiving Adapter can be used to convert *any* receiver having an intermediate frequency between 450 and 500 kc. On AM reception, B&W's exclusive "Gating Control" permits tuning over a narrow frequency range without disturbing the main receiver tuning. Sharp skirt selectivity on CW, AM phone, or SSB is assured by an integral 20 kc toroidal type band-pass filter with 3 kc passband. Signals outside passband are attenuated a minimum of 50 db. Easy to install and adjust, the unit is entirely self-contained in an attractive cabinet complete with power supply and 7" dynamic speaker.

See it at your distributors' or write for literature

**BARKER & WILLIAMSON, Inc.**

237 FAIRFIELD AVENUE, UPPER DARBY, PA.

Relation of Model 370 passband to that of station receiver for various positions of the function switch.

### Send for our lists of Top Buys in Reconditioned Ham Gear

Everyone's trading high with ALLIED these days, and we have on hand outstanding buys in exceptionally fine reconditioned Ham Gear. Ask for our lists of money-saving, top-condition equipment.

The date all HAMS have waited for...

# NC-300 DAY IS SEPT. 30!

Distributors everywhere unveil the

## NC-300 dream receiver

Now see and hear for yourself the first receiver especially built to include all the features hams want most—at a price most hams are willing to pay! The NC-300 will be at your distributors FRIDAY, SEPTEMBER 30! Coast-to-coast, it's NC-300 Day.

Thousands of different suggestions were carefully considered in the contest National sponsored to find out what hams wanted most in a receiver. And this receiver—the NC-300—is precision-built to include the most wanted features asked for among the thousands of suggestions received!

You must see the NC-300. For back of this "dream receiver" is the solid guaranty of National's 41-year reputation as pioneers in receiver design and production.

Ham history is being made on FRIDAY, SEPTEMBER 30. Mark the date. Be sure to be at your distributors.

*tuned to tomorrow*

# National

NATIONAL COMPANY, INC. 61 SHERMAN ST., MALDEN 48, MASS.

**Here are  
just a few  
of the many  
new features**

No greater sensitivity in any ham receiver at any price (3-6db noise figure on all amateur bands) plus... greater stability than most receivers costing up to \$695.

NEW! Features a total of 10 dial scales for coverage of 160 to 1 1/4 meters with National's exclusive new converter provision with the receiver scales calibrated for 6, 2, 1 1/4 meters using a special 30-35 mc tunable IF band.

NEW! Longest slide rule dial ever! More than a foot long! Easily readable to 2 kc without interpolation up to 21.5 mc.

NEW! 3 position IF selector—.5 kc, 3.5 kc, 8 kc—provides super selectivity, gives optimum band width for CW, phone, phone net or VHF operation.

NEW! Separate linear detector for single sideband...decreases distortion by allowing AVC "on" with single sideband...will not block with RF gain full open.

NEW! Hi-speed, smooth inertia tuning dial with 40 to 1 ratio! Provides easier, more accurate tuning. Smoothest dial you've ever used.

NEW! Exclusive optional RF gain provision for best CW results allows independent control of IF gain!

NEW! Giant, easy to read, "S" meter!

NEW! Provision for external control of RF gain automatically during transmitting periods.

NEW! Muting provision for CW break-in operation.

PLUS—the newest look in ham receivers... "Massive in the modern manner"...truly a "dream receiver" that can be used either as a table or rack model!

# LEADING AMATEUR DESIGNS ...USE RCA TUBES

Take the Collins 75A4, for example. Known by radio amateurs for its high signal sensitivity and operating stability, this versatile receiver uses RCA Receiving Tubes to assure maximum circuit performance from the input to the output.

Here are reasons why leading amateur and commercial designers specify *RCA Receiving Tubes*: RCA Tubes are known for their background "quietness"—a feature that provides a lower noise threshold and enables you to boost receiver sensitivity. RCA Receiving Tubes have high uniformity of characteristics, can be "interchanged" without a lot of circuit "fussing"—no matter where or when you buy your tubes. And RCA Receiving Tubes "stand the gaff" of on-air operations; you can plug them in and then forget them!

There is an RCA Receiving Tube for virtually every receiver and transmitter application in amateur radio. See your RCA Tube Distributor for the types you need. For technical data, write RCA, Commercial Engineering, Section I37M, Harrison, N. J.

## New RC-17 RCA Receiving Tube Manual

Revised, up-to-date technical reference on RCA Receiving Tubes. Includes basic tube theory, installation and operations data, application help, charts, circuits. A "must" reference for every ham shack. Only 60 cents, from your RCA Tube Distributor.

# HIGH FIDELITY TRANSFORMERS

FROM STOCK... ITEMS BELOW AND 650 OTHERS IN OUR CATALOGUE B.

### TYPICAL UNITS

#### LINEAR STANDARD series

Linear Standard units represent the acme from the standpoint of uniform frequency response, low wave form distortion, thorough shielding and dependability. LS units have a guaranteed response within 1db. from 20 to 20,000 cycles.

Hum balanced coil structures and multi-pole alloy shielding, where required, provide extremely low inductive pickup.

These are the finest high fidelity transformers in the world. 85 stock types from milliwatts to kilowatts.

**LS-10X Shielded Input**  
Multiple line (50, 200, 250, 500/600, etc.) to 50,000 ohms ... multiple shielded.

**LS-19 Plate to Two Grids**  
Primary 15,000 ohms.  
Secondary 95,000 ohms C.T.

**LS-50 Plate to Line**  
15,000 ohms to multiple line ... +15 db. level.

**LS-63 P.P. Plates to Voice Coil**  
Primary 10,000 C.T. and 6,000 C.T. suited to Williamson, MLF, ul-linear circuits.  
Secondary 1.2, 2.5, 5, 7.5, 10, 15, 20, 30 ohms. 20 watts.

CASE	LS-1	LS-2	LS-19
Length	3 1/4"	4-7/16"	5-13/16"
Width	2 3/4"	3 1/2"	5"
Height	3 1/4"	4-3/16"	4-11/16"
Unit Wt.	3 lbs.	7.5 lbs.	15 lb

#### HIPERMALLOY series

This series provides virtually all the characteristics of the Linear Standard group in a more compact and lighter structure. The frequency response is within 1 db. from 30 to 20,000 cycles. Hipermalloy nickel iron cores and hum balanced core structures provide minimum distortion and low hum pickup. Input transformers, maximum level +10db. Circular terminal layout and top and bottom mounting.

**HA-100X Shielded Input**  
Multiple line to 60,000 ohm grid ... tri-alloy shielding for low hum pickup.

**HA-108 Plate to Two Grids**  
15,000 ohms to 135,000 ohms in two sections ... +12 db. level.

**HA-113 Plate to Line**  
15,000 ohms to multiple line ... +12 db. level ... 0 DC in primary.

**HA-133 Plate (DC) to Line**  
15,000 ohms to multiple line ... +15 db. level ... 8 Ma. DC in primary.

CASE	H-1	H-2
Length	2 3/4"	3-9/16"
Width	1-13/16"	2-13/16"
Height	3 1/4"	3 1/2"
Unit Weight	2 lbs.	5 lbs

#### ULTRA COMPACT series

UTC Ultra Compact audio units are small and light in weight, ideally suited to remote amplifier and similar compact equipment. The frequency response is within 2 db. from 30 to 20,000 cycles. Hum balanced coil structure plus high conductivity die cast case provides good inductive shielding. Maximum operating level is +7db. Top and bottom mounting as well as circular terminal layout are used in this series as well as the ones described above.

**A-10 Line to Grid**  
Multiple line to 50,000 ohm grid.

**A-18 Plate to Two Grids**  
15,000 ohms to 80,000 ohms, primary and secondary both split.

**A-20 Mixing Transformer**  
Multiple line to multiple line for mixing mikes, lines, etc.

**A-26 P.P. Plates to Line**  
30,000 ohms plate to plate, to multiple line.

A CASE	
Length	1 1/4"
Width	1 1/8"
Height	2 1/2"
Unit Weight	7/8

#### OUNCER series

UTC Ouncer units are ideal for portable, concealed service, and similar applications. These units are extremely compact ... fully impregnated and sealed in a drawn housing. Most items provide frequency response within 1 db. from 30 to 20,000 cycles. Maximum operating level 0 db. These units are also available in our stock P series which provide plug-in base. The O-16 is a new line to grid transformer using two heavy gauge hipermalloy shields for high hum shielding.

**O-1 Line to Grid**  
Primary 50, 200/250, 500/600 ohms to 50,000 ohm grid.

**O-8 Plate to Two Grids**  
15,000 ohms to 95,000 ohms C.T.

**O-9 Plate (DC) to Line**  
Primary 15,000 ohms, Secondary 50, 200/250, 500/600.

**O-14 50:1 Line to Grid**  
Primary 200 ohms, Secondary .5 megohm for mike or line to grid.

OUNCER CASE	
Diameter	7/8"
Height	1-3/16"
Unit Weight	1 oz.

150 Varick Street, New York 13, N. Y. EXPORT DIVISION: 13 E. 40th St., New York 16, N. Y. CABLES: "ARL"

**LAST YEAR'S WINNER.** Benjamin S. Hamilton, W6VFT, is congratulated by Val Peterson, right, Administrator, Federal Civil Defense Administration. J. Milton Lang, general manager of the G-E Tube Department, looks on.

# NOMINATIONS NOW OPEN FOR 1955 EDISON AWARD

The Fourth Annual Edison Radio Amateur Award will give you an opportunity to recommend for high honors an amateur who has rendered important public service.

Handsome trophy, a \$500 check, and coast-to-coast recognition await the 1955 winner. The panel of judges will consider only candidates nominated by letters from you and others.

Start now to make your selection and assemble the facts for your nominating letter. Read the Award Rules at right!

Radio amateurs and their friends are generous in acclaiming accomplishment. No better means for this exists than for you to name . . . soon . . . a candidate for the Edison Award.

Send your letter to *Edison Award Committee, General Electric Company, Tube Department, Schenectady 5, N. Y.*

## RULES OF THE AWARD

**WHO IS ELIGIBLE.** Any man or woman holding a radio amateur's license issued by the F.C.C., Washington, D.C., who in 1955 performed a meritorious public service in behalf of an individual or group. The service must have been performed while the candidate was pursuing his hobby as an amateur within the continental limits of the United States.

**WINNER OF THE AWARD** will receive the Edison trophy in a public ceremony in a centrally located metropolitan city. Expenses of his trip to that city will be paid.

**\$500 GIFT.** Winner will be presented with a check for this amount in recognition of the public service he has rendered.

**WHO CAN NOMINATE.** Any individual, club, or association familiar with the service performed.

**HOW TO NOMINATE.** Include in a letter the candidate's name, address, call letters, and a full description of the service performed. Your letter must be postmarked not later than January 2, 1956.

**BASIS FOR JUDGING.** All entries will be reviewed by a group of distinguished and impartial judges. Their decisions will be based on (1) the greatest benefit to an individual or group, (2) the amount of ingenuity and sacrifice displayed in performing the service. The judges will be:

**E. ROLAND HARRIMAN**, President, The American Red Cross.

**HERBERT HOOVER, JR.**, The Under Secretary, U. S. Department of State.

**EDWARD M. WEBSTER**, Commissioner, Federal Communications Commission.

**GOODWIN L. DOSLAND**, President, American Radio Relay League.

Winner of the Award will be announced on or before Thomas A. Edison's birthday, February 11, 1956.

Employees of the General Electric Company may nominate candidates for the Edison Radio Amateur Award, but are not permitted to receive the Award.

## 75A-4 RECEIVER

latest in the 75A series  
is *unmatched* in Amateur reception because  
of such outstanding  
features as these—  
exclusive with Collins:

- Q-MULTIPLIER for superior rejection of heterodyne interference
- PASSBAND TUNING for switching sidebands and dodging interfering signals
- AVC on SSB and CW as well as AM
- LINEAR OSCILLATOR provides 1 kc dial calibration on all Ham bands
- DUAL DETECTORS for low distortion sideband reception
- MECHANICAL FILTER for best skirt selectivity (three selectable filters available at slight extra cost)
- DUAL CONVERSION crystal controlled for excellent stability

Write or visit your nearest Collins distributor for complete information on Collins new SSB line, and ask for your copy of this latest brochure.

# why is the **SX-96** the most wanted receiver on the air?

The Hallicrafters double conversion selectable side band receiver offers major improvements in stability by the addition of temperature compensation in the high frequency oscillator circuits and the use of crystal controlled second conversion oscillators. Hallicrafters highly selective 50 kc i-f system is used in this new precision-built receiver.

**Coverage:** Standard Broadcast, 538-1580 kc; Three S/W Bands, 1720 kc-34 Mc, Band 1: 538 kc-1580 kc-Band 2; 1720 kc-4.9 Mc-Band 3: 4.6 mc-13 mc-Band 4: 12 mc-34 mc.

**Type of Circuit:** Double conversion superheterodyne over the entire frequency range.

**Type of Signals:** AM-CW-SSB.

**Features:** Precision gear drives are used on both main tuning and band spread dials. Double conversion with selectable crystal controlled second oscillators. Selectable side band reception of both suppressed carrier and full carrier transmissions by front panel switch, delayed AVC, CW operation with AVC on or off. Calibrated bandspread, "S" meter, low drift, double conversion superhet.

**Controls:** Sensitivity, band selector, volume, tuning, AVC on/off, noise limiter on/off, AM/CW-SSB, Bandspread, selectivity, pitch control, response (pwr on/off, LSB, USB-2 tone pos.), receive-standby.

**Intermediate Frequencies:** 1650 kc and 50 kc.

**Tuning Assembly and Dial Drive Mechanism:** Separate 3 section tuning capacitor assemblies for main tuning and bandspread tuning. Circular main tuning dial has 0-100 logging scale. Bandspread dial is calibrated for the 80, 40, 20, 15, and 11-10 meter amateur bands.

**Selectivity:** Five steps of bandwidth calibration at 6 db points; 5 kc, 3 kc, 2 kc, 1 kc, and .5 kc.

**Antenna Input Impedance:** Balanced/unbalanced.

**Headphone Output Impedance:** Nominal 500 ohms.

**Audio Output Impedance:** 3.2/500 ohms.

**Automatic Noise Limiter:** Series noise limiter operated by toggle switch on front panel.

**Carrier Level Indicator:** Calibrated in "S" units from 1 to 9, decibels to 90 db over S9, microvolts from 1 to 1000 k.

**External Connections:** 3.2/500 ohm speaker terminals, terminals for single wire or double antenna, phono jack, AC power cord, socket for DC operation and remote control, audio output terminals, "S" meter electrical adjustment and mounting hole for co-axial cable connector. Phones jack on front panel.

**Audio Power Output:** 1.5 watts with 10% or less distortion.

**Power Supply:** 105/125 V, 50/60 cycle AC.

## Section Communications Managers of the ARRL Communications Department

**Reports Invited.** All amateurs, especially League members, are invited to report station activities on the first of each month (for preceding month) direct to the SCM, the administrative ARRL official elected by members in each Section. Radio club reports are also desired by SCMs for inclusion in *QST*. **ARRL Field Organization station appointments** are available in the areas shown to qualified League members. These include ORS, OES, OPS, OO and OBS. SCMs also desire applications for SEC, EC, RA1 and PAM where vacancies exist. All amateurs in the United States and Canada are invited to join the Amateur Radio Emergency Corps (ask for Form 7).

# With the NEW Model HT-30 Transmitter/Exciter HALLICRAFTERS RAISES THE STANDARDS OF SSB TRANSMISSION

For almost a quarter of a century the constant goal of Hallicrafters engineers has been the improvement of receiving and transmitting equipment standards. This policy of continuous improvement is again reflected in the design and engineering of Hallicrafters amazing new HT-30 Transmitter/Exciter.

Here's a transmitter that's built to give you greater performance . . . greater dependability. And the HT-30 guarantees you greater enjoyment because it incorporates all these wanted features . . .

## CHECK THEM AT YOUR JOBBER TODAY!

- BUILT IN V.F.O. READS DIRECTLY IN KILOCYCLES.
- V.F.O. STABILITY IS EQUAL TO MOST CRYSTALS—.009%  
There are also provisions for 1 crystal for fixed frequency operation.
- SELECTIVE FILTER SYSTEM IS USED FOR RELIABLE SIDEBAND SELECTION. The circuitry employs the proven r.f. selective filter system used by major commercial communications companies. This system assures continued suppression of unwanted side band energy and distortion products. Hum, noise and unwanted side band are down 40 db or more, while undesired beat frequency is down at least 60 db. New 60 db range meter for constant monitoring of r.f. output and carrier suppression. Voice control system built in with adjustable delay and anti-trip features.
- SSB, AM, AND CW ARE ALL PROVIDED FOR IN ONE COMPACT UNIT. Front of panel full function control allows selection of AM, CW and upper or lower side band. Only 18" x 9 3/4" x 12"; the unit is powerful—35 watts peak output on SSB.

## FRONT PANEL CONTROLS

Band selector 80, 40, 20, 10 meters.  
Driver tuning.  
Final tuning.  
Speech level.  
Carrier injection —0 to 100%.  
Meter sensitivity.  
Calibration level.  
Power off, stand-by, warm-up, transmit.  
Operation control.  
VOX, Calibrate, MOX.  
Function selector—AM, CW, upper, lower side band.  
Tuning—V.F.O.  
10 Meter tuning control.  
V.F.O.—Crystal.

# THE AMERICAN RADIO RELAY LEAGUE, INC.,

is a noncommercial association of radio amateurs, bonded for the promotion of interest in amateur radio communication and experimentation, for the relaying of messages by radio, for the advancement of the radio art and of the public welfare, for the representation of the radio amateur in legislative matters, and for the maintenance of fraternalism and a high standard of conduct.

It is an incorporated association without capital stock, chartered under the laws of Connecticut. Its affairs are governed by a Board of Directors, elected every two years by the general membership. The officers are elected or appointed by the Directors. The League is noncommercial and no one commercially engaged in the manufacture, sale or rental of radio apparatus is eligible to membership on its board.

"Of, by and for the amateur," it numbers within its ranks practically every worth-while amateur in the nation and has a history of glorious achievement as the standard-bearer in amateur affairs.

Inquiries regarding membership are solicited. A bona fide interest in amateur radio is the only essential qualification; ownership of a transmitting station and knowledge of the code are not prerequisite, although full voting membership is granted only to licensed amateurs.

All general correspondence should be addressed to the administrative headquarters at West Hartford, Connecticut.

# "It Seems to Us..."

## "IN THE PUBLIC INTEREST . . ."

We write this just a week after a flood disaster ravaged our Northeast, still aghast at the tragedy of loss of life and property, yet with a growing feeling of pride in being a member of the body of amateur radio which did such a magnificent job of providing vital emergency communication.

This brief tribute will be woefully incomplete. In the true tradition of service, amateurs have been too busily engaged in disaster work to take time out to inform Hq. of their many accomplishments. Yet our own experience, even though limited almost entirely to the two spot frequencies housing the Connecticut 'phone and c.w. nets, makes it thoroughly evident that amateurs throughout the disaster areas banded together in the public interest, convenience and necessity, whether they wore c.d. armbands and manned the Radio Amateur Civil Emergency Service organization, or served strictly as amateurs in the various section and regional nets. A full week after the first alert, many are still at their posts, exhausted from endless hours at key or mike, hanging on because of the importance of the job being done.

In general amateur communications worked smoothly despite the confusion which Nature foisted on us all. Net discipline was good, station coöperation excellent. Amateurs by the hundreds, not in the immediate flooded areas, must have been standing by hour after hour to offer assistance if and when needed, and we'd like to observe that one good measure of the efficiency of disaster communication is the number of stations standing silently by. The key was teamwork, the aim to get the job done.

Teamwork and efficiency it was. In one instance W1AW had a circuit to a station in a hard-hit area for most of four days without knowing just where he was located, what kind of power he was using, or even his name, and when the press made inquiries for such information we were not ashamed to profess ignorance — there just wasn't time for such details. In another instance, few if any amateurs handling official disaster traffic to and from one civil-defense installation knew of the heroic performance of its operator — his

house had been washed away and his mother drowned, yet as an amateur his first thought was to fight his way to c.d. headquarters to provide the town with urgently-needed communication.

*QST* wants to record the performance of the amateur body in the Great Flood of 1955, and we solicit your help in providing information to that end, whether it be an outstanding story of personal or group sacrifice and accomplishment, or the mere fact that you were standing by to help if needed. Then there is one more job to be done. We must all admit there were occasional foul-ups in our operations, just as there were in all flood-fighting activities. As will undoubtedly be done by other agencies wanting to profit by the tragedy of experience, we should examine our own performance to determine how next time — and there will be a next time — we can be even better prepared.

## THE REASON WHY

From time to time most of us have occasion to explain amateur radio to BCLs. It isn't too hard to tell them how we establish contact with another ham, nor to answer the perennial question "How far can you talk with that thing?" — perhaps with a slight exaggeration! More difficult to explain is the fascination which keeps us active year after year, which makes us stay up all night calling "CQ SS" or chasing DX.

One of the best descriptions of our hobby was written not by an amateur but by a sociologist who had picked amateur radio as an example of an American institution which had gone from its earliest beginnings to a respected position in the Twentieth Century. In his doctorate thesis the sociologist, Dr. Raymond V. Bowers of Yale University, asked himself "What are the elements of this core complex in the amateur radio institution?", then proceeded to answer in this fashion:

The central trait is the means of communication with others on equal terms, of finding friendship, adventure and prestige while seated at one's own fireside. In picking his human contacts out of the air the amateur is not seen by them. . . . He is not known by the company he keeps nor by the clothes

he wears but by the signals he emits. He enters a new world whose qualifications for success are within his reach. A good home-made set gives him more prestige than a commercially-manufactured one. There are no century-old class prejudices to impede his progress. He enters a thoroughly democratic world where he rises or falls by his own efforts. When he is W9XYZ, a beginner, the radio elders help him willingly, and when he becomes W9XYZ the record-breaker and efficient traffic handler, he willingly helps the younger generation. Without a pedigree, a chauffeur, or an old master decorating his living room he can become a prince — of the air. At the close of the day, filled with the monotonous routine of the machine age, he can find adventure, vicarious travel, prestige and friendship by throwing in the switch and pounding his signals into the air.

Though this was written over twenty years ago, it still expresses the attractions that call us to our hobby today. Though perhaps the game has become more complicated, a new and friendly world still opens its arms in welcome whenever the rig is fired up and a good fist or well-modulated voice sends out a CQ.

## A.R.R.L. CONVENTIONS

### CENTRAL DIVISION

*South Bend, Ind. — Oct. 15th-16th*

Typical "Hoosier Hospitality" will be extended to all amateurs and friends attending this Convention. The Hotel Oliver will be headquarters, although other fine hotels in the city will share in the accommodations for guests. Rates are moderate, and a special discount of 25 per cent is offered to conventioners.

The program will be of interest to amateurs in every phase of operating, be it s.s.b., v.h.f., DX, MARS, or what have you. Even the Novice hasn't been forgotten. There will be lectures and demonstrations of general interest and again, these features will be headed by the top men in their fields. There will be a banquet on Saturday night, with a nationally-known speaker and headline entertainment. The mobile enthusiast will find plenty of activity to attract his attention, and of course there will be an initiation into the Royal Order of Wouff Hong at midnight on Saturday.

Has the XYL been forgotten? No, Sir! Plans for her entertainment are high in priority. XYL activities are being planned by XYLs, and many activities outside of ham radio will make her stay as pleasant as possible. A handsome gift will be presented to each lady registering.

The registration fee is \$3.50 in advance and \$4.00 at the door. Advance registrations close to October 7th, and the committee will take care of your housing arrangements, too!

Remember, the committee is determined to have good fellowship and fraternalism as the theme. The program is designed for you to have fun, with just the right balance of serious discussion, technical talks, and entertainment. You will have a complete program, and you can relax too!

Don't forget the address! It's Central Division Convention, Box 551, South Bend, Ind. Make all checks payable to the Central Division Convention. See you there?

### MIDWEST DIVISION

*Omaha, Nebr. — Oct. 22nd-23rd*

The Ak-Sar-Ben Radio Club will be host this year to the Midwest Division at Omaha on October 22nd and 23rd. Those who have attended previous doings out this way know that every one is better than the last, and this one will be no exception. There will be an impressive array of speak-

ers that you won't want to miss, and that "once-a-year" opportunity to visit with all of the old gang. A social hour and a 'teen party have been scheduled as well as YL and XYL activities. The most important part hasn't been forgotten either — the food will be good and there will be plenty of it. For reservation information write P. O. Box 626, Omaha, Nebr.

## OUR COVER

This month's cover shows a close-up view of the 4-65A final and its tank assembly in "A Modern Medium-Power Transmitter." The rig was designed and built by Richard Egbert, ex-W2QMO, and features complete break-in with special attention paid to keying characteristics. Primarily a c. w. rig, its power output and ease of operation should make it a hit with the contest and traffic man. For further details, see this issue's lead article.

## FEDERAL COMMUNICATIONS COMMISSION

*Washington 25, D. C.*

Editor, QST:

Because it concerns a rule which appears to have been widely misunderstood as to its correct application, we are requesting your cooperation in giving publicity to this letter.

Section 12.113 of Part 12, Rules Governing Amateur Radio Service, specifies that: "Sideband frequencies resulting from keying or modulating a carrier wave shall be confined within the authorized amateur band." This applies to all amateur frequency bands allocated for telephony emissions. Radiation of normal or spurious sideband frequencies, resulting from modulation, outside the amateur telephony bands is in violation of Section 12.113 regardless of whether such radiation is on frequencies allocated to the Amateur Service or to other radio services.

Questions as to what operating carrier frequency near the edge of a telephony band would assure that transmissions would be in compliance with Section 12.113 cannot be answered in terms of a specific carrier frequency. Obviously, the characteristics of the voice modulating the transmitter and the operational characteristics of the transmitter itself determine the bandwidth of emission. At the present time, it is believed that the exact specification of allowable bandwidths for amateur telephony together with the necessary specification of measuring equipment and techniques would introduce unnecessary and, therefore, undesirable complications of the Amateur Rules.

It is the responsibility of each operator of an amateur station to make sure that the operation of his station is within the requirements of Section 12.113. That part of Section 12.133 which states that "This spurious radiation shall not be of sufficient intensity to cause interference in receiving equipment of good engineering design including adequate selectivity characteristics, which is tuned to a frequency or frequencies outside the frequency band . . ." is considered applicable to the determination of compliance with Section 12.113.

If operation near either edge of an amateur telephony band is contemplated, all amateurs are cautioned that radiation of energy outside the band to the degree indicated in Section 12.133 will be considered to be in violation of Section 12.113, whether double-sideband full-carrier or single-sideband suppressed-carrier is used.

Very truly yours,

MARY JANE MORRIS  
Secretary

# A Modern Medium-Power Transmitter

## The 4-65A in a Multiband VFO Rig

BY RICHARD A. EGBERT,\* W8ETU, EX-W2QMO

• Built with an eye primarily on contest competition, this neat piece of construction combines features that will appeal to all types of operators. Designed around the versatile 4-65A, it will operate efficiently at any plate voltage from 600 to 2000 or more, at inputs from 90 watts or less up to 300 watts. Features include remote-tuning VFO, bandpass-coupled multiplier stages, multiband driver tuning, pi-section output, and differential keying for clean break-in operation. Covers all bands from 80 through 10.

THE urge to rebuild and improve the station equipment periodically hits us all. In the author's case, this urge was brought about by the trend in the local amateur radio club, The Order of Boiled Owls, toward the more serious amateur activities, such as Sweepstakes, DX contests, and a generally competitive program. Since the main transmitter at W2QMO was a far cry from what is needed in the way of a transmitter for contests and the like, several requirements for what we thought would make a truly modern rig were written down. It was felt that the new rig should be capable of the following:

- 1) Respectable power output by today's standards.
- 2) Full break-in operation.
- 3) Excellent keying characteristics.
- 4) Absolute freedom from TVI.

Mix, "Simple Remote Tuning for the VFO," *QST*, January 1953.

The 4-65A transmitter in a rack cabinet with remote VFO and control unit to the right. Along the bottom of the main panel are the band-switch, the grid meter and the excitation control. Above are the controls for the multiband tuner, the plate tank capacitor, the rotary inductor, and the output-capacitor switch. The plate milliammeter is at the top.

5) Safety from electrical shock in the course of normal operation.

6) Minimum fussing to get from one band to another.

7) Pleasing, commercial appearance.

The usual perusal through recent issues of *QST* and other magazines failed to turn up a design that quite fitted the above, but many good features were noted, some of which have been incorporated in the transmitter to be described. The rig shown in the accompanying photographs has been in constant operation for more than a year, with results that have more than justified the time and effort expended in building it.

### The Circuit

Fig. 1 shows the schematic circuit, beginning with the familiar Clapp oscillator. The oscillator tuned circuit, padders, and feed-back capacitors are mounted in a separate  $5 \times 6 \times 9$ -inch aluminum utility box, and connected to the main transmitter chassis by a six-foot length of RG-22/U cable. This arrangement, as introduced and discussed in previous issues of *QST*,<sup>1</sup> has proved to be a sure-fire method of building an oscillator that "sits still" almost from the moment it is turned on. There is nothing more disconcerting than working in a net, or sweating out DX, with a VFO that wanders for a number of hours before settling down. With the VFO tuned circuit apart from the main portion of the transmitter, and kept a reasonable distance from other sources of heat, the oscillator frequency becomes stable very soon after the rig is turned on. As with all oscillators, the quality of the components in the frequency-determining circuits should be the highest possible, and the construction rigid.

 T<sub>2</sub> — 6.3-volt 1.2-amp. filament transformer.

The oscillator tube, a 6AH6, was chosen after a struggle with the types that are more usually used in this service. One of the requirements for the keying circuit employed is that the oscillator start with as little delay as possible after the key is closed. Since the feed-back to the oscillator is low, due to the high values of C<sub>4</sub> and C<sub>5</sub> and the L/C ratio used, plus the capacitance of the length of RG-22/U, a tube with a high value of transconductance must be used. In the so-called electron-coupled type of circuit, the screen grid is used as the principal anode, instead of the plate, and the transconductance we're talking about is the grid-to-screen transconductance. Although the 6AG7 is the most frequently used oscillator tube these days, it did not perform well in this circuit. The 5763 was also tried but, with either tube, the oscillator did not start quickly enough, and the output signal was chirpy. All other things being equal, the 6AH6 seems to be the best of the bunch for the job, and further work along these lines is contemplated.

The oscillator operates in the 80-meter band, and is switched to either of two ranges by S<sub>1</sub>. With S<sub>1</sub> closed, the oscillator tunes from 3.5 to 3.75 Mc. and when S<sub>1</sub> is open, the range is from about 3.75 to 4.0 Mc. This arrangement provides 180 degrees of bandspread on 80-meter c.w., nearly 135 degrees on 40 meters, 90 degrees on 20, and about 75 degrees on the 15-meter band. The 10-meter band is spread over most of the dial and, in the second-range position, the 75-meter 'phone band occupies almost all of the dial. With the 5-to-1 ratio of the National ACN dial, tuning is quite easy.

<sup>2</sup> Chambers, "A Two-Control VFO Rig with Bandpass Exciter," *QST*, August, September, 1950.

<sup>3</sup> Chambers, "Single-Ended Multiband Tuners," *QST*, July, 1954.

A 6C4 cathode follower isolates the oscillator from subsequent stages, and its output is more than adequate to drive the 6AK6 80-meter stage. L<sub>2</sub>, in the grid circuit of the 6AK6, is tuned to a frequency slightly higher than 4.0 Mc. This adjustment provides fairly constant drive to the 6AK6, since the output from the Clapp oscillator falls off very seriously as the circuit is tuned higher in frequency.

Quick and easy frequency changing in a transmitter dictates the use of fixed-tuned circuits wherever possible. Having to search through piles of charts for the proper multiplier-control settings, and adjusting numerous controls is hardly easy operation. Loaded, broadband inductors eliminate the need for tuning, but result in wide variations in output from the stages using them when the frequency is shifted appreciably. In addition, self-oscillation sometimes occurs in the multiplier stages at some frequency between the center frequencies of two of the coils.

Although not new by any means, the bandpass coupler has been sadly neglected by the amateur fraternity as a means of having one's cake and eating it, too.<sup>2</sup> The bandpass coupler, if properly used, can be made to provide uniform output over an entire amateur band. Because the coupling is inductive, rather than capacitive, and since there are two tuned circuits, rather than one, a measure of protection against transfer of unwanted harmonics is provided. The bandpass couplers are adjusted as described later, and then switched in and out of the circuit, as needed, without further adjustment. As it turns out, the switching scheme of this transmitter is quite a bit more simple than one would expect, since it is accomplished with a 3-pole, 4-position switch.

Except for the bandpass couplers, the multiplier stages are conventional, with cathode bias to limit the plate dissipation of the tubes not in use at any given time. One of the 6C4s is a tripler, to provide output on 15 meters. The other two are doublers.

For the purist, a small ceramic trimmer capacitor could be connected from grid to ground in each of the multiplier stages, since the input capacitance of the 6C4s is somewhat lower than that of the pentode driver, and some change in the coupler secondary tuning occurs when switching from a multiplier grid to the driver grid.

The driver, a 5763, is driven on 80 meters by the 6AK6, and on all other bands by one of the multipliers. The screen voltage to the 5763 is supplied from a potentiometer, R<sub>1</sub>, which controls the output of the driver stage, and consequently the drive to the final amplifier. The 5763 is shunt fed in its plate circuit, and its output is capacitively coupled to a multiband tuner<sup>3</sup> in the grid of the final amplifier.

The driver operates straight through on all bands except 10 meters. It is driven by the 20-meter multiplier, and doubles to 10 meters for output in the 10-meter band. Adequate output from the driver is available on all bands to drive the final amplifier to full output.

The pi-section tank circuit is a good choice in

any transmitter, but where the voltages are high enough to be extremely dangerous, it is literally a lifesaver. No need to put one's hands inside the transmitter during normal operation as with plug-in coils, and the additional harmonic attenuation and operating ease afforded by the pi network makes this type of final-amplifier tank circuit very desirable indeed.

The final amplifier shown in the schematic diagram and photographs is, with the exception of the tube type, almost an exact duplication of one described in an earlier issue of *QST*.<sup>4</sup> It was found unnecessary to neutralize the final in our particular layout, since the amplifier was stable on all bands. Although not shown in the schematic, a parasitic suppressor is used in the plate lead of the 4-65A, to rid the transmitter of the inevitable v.h.f. parasitic.

The final-amplifier tube, a 4-65A, was chosen because of its reputation for stability and ruggedness, and its ability to operate efficiently at plate voltages from 600 to 3000 volts. At a plate voltage of 2000 volts, it is possible to load the final to an input of 300 watts.

$L_{14}$  is a rotary inductor whose origin is unknown, but whose inductance turned out to be just what was needed. It is considerably larger, physically, than is necessary in a transmitter of this size, and one of the smaller commercial units could be used instead.  $L_{13}$ , an air-wound inductor, constitutes nearly all of the tank inductance when the transmitter operates on 10 meters, and its inclusion shifts the shunt capacitance of the rotary inductor to the output side of the pi network,

<sup>4</sup> Grammer, "Pi-Network Tank Circuits for High Power," *QST*, October, 1952.

tending to keep the  $Q$  of the tank circuit down at 10 meters. This has been explained in *QST*.<sup>4</sup> The output capacitors are 100- $\mu$ mf. Type CM-45 mica units, switched in and out of the circuit by  $S_3$ , a progressively-shorting rotary switch.  $RFC_1$  is a National type R-175 choke which has been modified to be effective on all amateur bands from 3.5 to 30 Mc. Since this transmitter was built, the National Company has announced a new shunt-feed r.f. choke, the R-175A, that is free from "holes," and is usable in this type of rig without modification.

As one of the preventives against TVI, a series-resonant circuit, consisting of a 100- $\mu$ mf. mica capacitor,  $C_{16}$ , and a few turns of wire,  $L_{15}$ , is connected across the output of the transmitter, at the output connector. This series-tuned circuit is adjusted to resonate at the frequency of the television channel most likely to be interfered with in a given locality, and is effectively a short circuit across the transmitter output at this frequency. Thus, any harmonics generated within the transmitter at, for example, 56 Mc., are prevented from reaching the antenna.

Screen voltage to the final amplifier tube is supplied through a dropping resistor, and the tube is protected in the usual manner with a 6W6GT clamp tube. Two clamp tubes in parallel would afford better protection, in the event of failure of one of them. The 0B2 voltage-regulator tube is connected in series with the screen lead of the 4-65A to reduce the input to minimum under key-up conditions. The 0B2 can be seen mounted on a bracket under the chassis. (It was an afterthought.)

### Keying

As shown in the schematic, the transmitter is equipped with a built-in differential keyer. For those who are not familiar with differential keying, it may seem to be excess baggage. This is not at all the case. Much of the break-in operation on the air today is accomplished by keying the

The VFO remote tuning unit and control box. The tuning unit is enclosed in a 5 × 6 × 9-inch aluminum box mounted on shock absorbers. The control-unit enclosure is made up of two 7 × 9 × 2-inch aluminum chassis, bottom to bottom. The range-control switch and remote cable connector are mounted on one end of the tuning unit. A fuse holder projects from the end of the control unit.

oscillator. Fortunately, the Clapp oscillator, which is now almost universally in use, keys better than its forerunners, but there aren't many keyed oscillators that can be boasted about when compared to a keyed amplifier. For the ham who takes pride in his signal, oscillator keying of any kind is pretty much out of the question. Of course, break-in operation can be had by using a well-shielded oscillator, left running while keying a later stage, or by using some form of heterodyne exciter. These two schemes are certainly workable, but present problems that are not easily overcome by the average ham. Many of the differential keying arrangements require high-voltage bias supplies and high-priced relays. Some time ago, an article, in *QST*,<sup>5</sup> described a keyer circuit that needs only 75 volts of negative bias, and no relays. It is this keyer that is incorporated into the rig being described. The extra components involved are few and inexpensive, and good amplifier keying can be had, with all the conveniences of the keyed oscillator.

The keyer circuit consists of a twin-triode oscillator-switching tube, and another twin triode in a standard vacuum-tube keyer circuit. With the key up, the 6BL7GT is cut off, and the current through the right-hand section of the 12AU7 is limited to a low value by the cathode resistor.  $R_2$  is adjusted to provide a sufficiently negative potential at the plate of the left half of the 12AU7 to cut the oscillator off. When the key is closed, the grid of the right half of the 12AU7 is grounded immediately, the cathodes assume a low positive voltage, the grid of the left triode becomes negative, and the plate of the left half assumes ground potential. Thus, in a very short period of time, the oscillator is turned on. The resultant click generated by the oscillator coming on quickly is not heard in the output because the charge accumulated in  $C_{17}$  must leak off to ground through  $R_3$  before the 6BL7GT

conducts. By the time the 6BL7GT is conducting, and the signal is on the air, the click generated by the oscillator is over with.

When the key is released, the grids of the 6BL7GT and the right half of the 12AU7 will start falling to the bias-supply voltage. The 6BL7GT will cut off first, and some time later the voltage across the key will get to a sufficiently negative value for the left half of the 12AU7 to conduct, cutting the oscillator off. The oscillator, therefore, has been turned on before the amplifier (in this case, the driver) is keyed, and is turned off after the amplifier has stopped delivering power.

The keyer bias-supply transformer,  $T_2$ , is simply a low-current filament transformer, connected backwards, with its 6.3-volt winding excited from  $T_1$ , and its primary delivering 115 volts to a selenium rectifier,  $CR_1$ , and a conventional resistance-capacitance filter.

Metering is necessary only in the final-amplifier grid and plate circuits, since all other stages are fixed tuned. Two meters are employed — a 2-inch unit,  $MA_1$ , mounted under the chassis to measure grid current, and a 3-inch meter,  $MA_2$ , on the panel, reading plate current.

Connections to the transmitter are made via a barrier strip mounted on the rear skirt of the chassis, and a Millen safety terminal for the high voltage.

### Construction

The r.f. section of the transmitter, with the exception of the oscillator tuned circuit, is built on a standard  $13 \times 17 \times 3$ -inch aluminum chassis, with a  $10\frac{1}{2} \times 19$ -inch rack panel. All

<sup>5</sup> Puckett, "De Luxe Keying without Relays," *QST*, September, 1953.

Rear view of the tuning unit showing the mounting of the inductor on polystyrene sheet and rods and the arrangement of other components. Ceramic trimmers, mounted on the insulating panel at the left, were later replaced with air trimmers ( $C_2$  and  $C_3$ ).

of the mechanical work was done at home, in the shack, using the common hand tools that most hams possess, and a couple of chassis punches. Most of the details are readily apparent from the photographs, and the layout is quite straightforward and conventional. About one-third of the main chassis is taken up by the exciter chassis. The remainder is enclosed in a "doghouse" constructed of aluminum sheet and angle, and fastened together with machine screws. The enclosure is approximately 10 by 10 by 7 inches.

The top-view photograph shows most of the chassis layout, with the 6AH6 oscillator tube located in the top right-hand corner and the cathode follower next to it at the left. Immediately to the left of the cathode follower is the 12AU7 keyer tube. Directly below the 6AH6 is the 6AK6 80-meter stage and, to its left, the 40-meter doubler. The 15-meter tripler is located behind the 40-meter stage, and the 20-meter doubler to its right. Arranged to the right and left of the associated tubes, the adjusting screws for the bandpass couplers can be seen.

Top view of W2QMO's transmitter. At the right, from left to right, progressing toward the bottom are the 12AU7, the 6C4 cathode follower and the 6AH6, the 40-meter 6C4 and the 80-meter 6AK6, the 15- and 20/10-meter 6C4s, the 6BL7GT, and the 5763. The 6W6GT clamper tube is at the upper left. The multiband tuner for the 5763 is enclosed in the box fastened against the final-amplifier enclosure. The tank capacitor is placed so that its shaft is central on the panel, and the rotary inductor is located so that its control and the control for the multiband tuner are symmetrical in respect to the tank-capacitor control. The turns counter for the rotary inductor is geared to the coil drive shaft.  $S_3$  and the mica output capacitors are off the left rear corner of the inductor. The v.h.f. series-resonated circuit is mounted against the rear wall, adjacent to the output connect. A copper strap connects the top of RFC<sub>1</sub> to the plate cap of the tube.

The multiband tuner used in the grid circuit of the final amplifier is housed in a 3 × 4 × 5-inch aluminum utility box, bolted to the side of the final-amplifier enclosure. The dial drive to this unit is equipped with a 5-to-1 reduction mechanism for easier tuning. (A National AN or AVD driver may be used here.) To the right of the multiband-tuner box, the 5763 driver tube is mounted, with the 6BL7GT keyer tube directly above it.

The final-amplifier components are mounted inside the enclosure, and arranged for short leads and panel symmetry. The socket for the 4-65A is mounted above the chassis on short spacers, with holes for air circulation below it. By-pass capacitors for the screen and heater of the final tube are grounded directly below the respective socket terminals, with suitable ground lugs fastened to the chassis. A shielded lead from the multiband tuner to the grid terminal of the 4-65A socket is run through the bottom of the utility box and the chassis and up through a hole in the chassis directly below the tube socket.

The 6W6GT clamp tube is mounted in front of the final-amplifier enclosure toward the right side of the chassis. Above the clamp tube, the Veeder Root counter can be seen. This was included to provide accurate resetting of the variable inductor. The counter is gear-driven from the rotary-induction shaft.

The bottom-view photograph shows the component layout, terminal strip and connectors. Since the photographs were made, a fan has been mounted below the final-amplifier tube socket, to aid in cooling.

### Building the Bandpass Couplers

The bandpass couplers started life as i.f. transformers. The original windings, forms, and cans were removed and discarded, and polystyrene coil forms, 1 inch in diameter and  $1\frac{1}{2}$  inches long, were drilled through their bottoms to be mounted on the studs that project from between the air-padding capacitors. The primary windings of the 80- and 40-meter coils are wound at the bottom ends of the forms and cemented in place with coil

The multiband tuner used between the driver and final amplifier is housed in a  $3 \times 4 \times 5$ -inch box fastened to the side wall of the amplifier enclosure. The 5763 and 6BL7 have been removed in this view.

dope. After the dope has dried, the rest of the coil form is sprinkled with talcum powder, and a layer of cellophane tape is wound around it, with the adhesive side out. On the sticky side, the secondary turns are wound firmly, but not so tightly that the winding can not be slid along the form for adjustment. The ends of the secondary windings are held in place with coil dope, applied carefully so that the whole thing doesn't become cemented to the form so that the secondary cannot be moved. The ends of the windings are now soldered to the capacitors, and the 80- and 40-meter couplers are complete.

The 20- and 15-meter couplers are made from Barker & Williamson Miniductors, lengths of which are slid inside the polystyrene coil forms. The forms are first slit with a fine saw to permit the ends of the windings to come out radially. The primary windings are inserted in the poly forms first, and the secondaries are slid in and out as needed for adjustment.

This photograph shows the method of assembling the bandpass couplers as described in the text.

### Power Requirements

Power supplies for the author's transmitter were built on a single  $13 \times 17 \times 3$ -inch steel chassis. Although the 4-65A will operate satisfactorily at plate potentials from 600 to 3000 volts, at least 2000 volts is necessary for an input of 300 watts.  $T_1$  supplies the final-amplifier, clamp-tube, the 6BL7 keyer-tube heaters, and  $T_2$ , the keyer bias transformer. The balance of the heaters are supplied from a replacement-type power transformer, rated at 750 volts, center-tapped, and 6.3 volts at 3.5 amperes.

It will be noticed that no power switches appear on the transmitter proper. All switching is done at a central control panel, located beneath the VFO tuning unit. As the schematic of Fig. 2 shows, 115 volts a.c. is brought into an automobile ignition switch,  $S_1$ , which allows the entire station to be shut off with a key. Since the key is carried in the author's pocket, there is little likelihood that the junior ops will get their little fingers across the high voltage. The switching is arranged so that it is necessary for the exciter, final heaters and high-

TABLE I

Bottom view of the main chassis showing the grouping of the bandpass couplers around the bandswitch in the upper left-hand corner.  $R_2$ , the bias-adjusting potentiometer for the v.t. switch circuit, is to the left of the grid-current milliammeter, top center. The 0B2 in the 4-65A screen circuit is mounted on a bracket below the meter. Filament and bias transformers are to the right. All power wiring is done with shielded wire.

voltage-rectifier heaters to be turned on before the power can be applied to the plate transformer.

The switch,  $S_5$ , a d.p.d.t. toggle, is the usual spotting switch, which grounds the key lead and opens the primary circuit of the plate transformer.

The power-control panel is made from two  $7 \times 9 \times 2$ -inch aluminum chassis, bolted together with their bottoms facing, with most of the front skirts cut away to receive an aluminum panel. The VFO tuned-circuit box is mounted on this with shock mounts.

### *Tuning Up*

After all wiring is checked, the oscillator tube and cathode follower are plugged into their sockets, and the exciter power turned on. If all is well, the signal will be heard in a receiver, in the vicinity of the 80-meter band. Next,  $S_1$  is opened,  $C_1$  set at minimum capacitance, and  $C_2$  adjusted until the signal is heard slightly above 4 Mc. When  $C_1$  is set at maximum capacitance, the signal should be found in the vicinity of 3.75 Mc.  $S_1$  should now be closed, and  $C_3$  adjusted until the signal is heard at slightly below 3.5 Mc. Some slight pruning of the tuned circuits may be

necessary, but it should be possible to get the oscillator to operate from below 3.5 Mc. to over 4.0 Mc., with a slight overlap around 3.75 Mc.

Now the bandpass couplers can be tuned, and this takes a lot more time to tell about than it does to accomplish. Set the bandswitch in the 80-meter position, the excitation control at zero, and plug in the rest of the tubes in the exciter section. Temporarily ground the cathode of the 5763, and connect a high-resistance voltmeter across the 5763 grid-leak resistor. All bandpass-coupler secondary windings should be pulled as far away from the primaries as possible. The VFO is now set at 3.75 Mc., and  $C_6$  and  $C_7$  tuned for maximum indication on the voltmeter. The secondary winding,  $L_4$ , should now be moved toward  $L_3$ , until the spacing is that given in the coil table. This spacing should be set very carefully in all cases, since a small deviation will result in a change in the bandpass characteristic. It is also to be noted that the coupler tuning capacitors are to be adjusted only when the windings are at the maximum spacing.

Next, move the high-resistance voltmeter to read the drop across the 6AK6 grid-leak resistor and set the VFO frequency at 4 Mc. Now adjust

$L_2$  for maximum grid voltage, and swing the VFO through its entire range. If the grid voltage increases when the frequency is lowered, decrease the inductance of  $L_2$ . Correct adjustment of  $L_2$  will result in nearly constant drive to the 6AK6 throughout the entire VFO range.

The rest of the bandpass couplers can now be adjusted, following the procedure described above for the 3.5-Mc. coupler, and with the voltmeter once again reading driver grid voltage. The 40-meter coupler should be adjusted with the VFO set at 3.6 Mc., the 20-meter coupler should be adjusted at 3.6 Mc., and the 15-meter coupler at 3.55 Mc. It should now be possible to tune through any of the bands with less than ten per cent variation in drive to the 5763.

The multiband tuner can now be checked, with the 4-65A in its socket, and heater voltage applied. It is suggested that a grid-dipper be used to ascertain that the grid circuit is tuning to the proper frequency and not to a harmonic. Grid tuning-dial settings should be logged for future reference, and note taken if two bands resonate at the same dial setting. If, for example, the 80- and 20-meter resonance points occur at or near the same dial setting, pruning of one of the coils will be necessary.

Adjustment of the keyer can now be made after removing the ground from the 5763 cathode.  $R_2$  is advanced toward its positive end (ground) until the voltage at Pin 1 of the 12AU7 is  $-15$  volts. The keying characteristic can be adjusted to individual taste later by adjusting the value of  $C_{17}$ .

### Pi-Tank Adjustment

The final amplifier is best tested at reduced plate voltage. Either a 50-ohm dummy load or an antenna known to present a resistive load of 50 ohms should be used for initial tune-up. Adjustment of the excitation control,  $R_1$ , will provide the correct grid current of 15 ma. to the final. With the bandswitch set in its 80-meter position, and the grid tank resonated, the plate tank capacitor,  $C_{15}$ , should be set at about 90 per cent of its maximum value, and the rotary inductor set at near-maximum inductance. A grid-dipper could be used here to establish a near-resonance point. The plate voltage should be applied, and  $C_{15}$  quickly tuned for a plate-current dip. If an appreciable change in capacitance is necessary to establish resonance, a new setting of the variable inductor should be tried, until the plate circuit resonates at 3.5 Mc. with almost all of the capacitance of  $C_{15}$  in the circuit. Full plate voltage can now be applied, and loading adjusted for a plate current of 150 ma. Now is a good time to check the 4-65A screen voltage, which should be 250 volts.

Adjusting the final amplifier on the other bands is carried on in much the same manner, setting the final tank capacitor to approximately the correct value (see Table II), adjusting the rotary inductor for resonance with a grid dipper, and finally resonating the circuit with power on. All settings should be logged for future reference.

It must be borne in mind that the values of inductance and capacitance given in the tune-up

# The "Extended Lazy H" Antenna

BY WALTER E. SALMON,\* VK2SA

ROTARY BEAMS were unknown in the early days of amateur radio, and most hams contented themselves with horizontal or vertical wires from which, after much patient work, they obtained varying degrees of effectiveness. With the development of the Yagi antenna the 2-, 3- and 4-element rotary beam became commonplace, and it would appear that the trend in this direction is increasing, particularly with amateurs residing in thickly-populated areas where land space is limited. No comment will be included about V beams and rhombics, since this article is written for the amateur who, although he is interested in operating on several bands, is not prepared to erect a costly mast structure to support several beams and also does not have the relatively-unlimited space necessary for the usual "dream" antenna farm.

The antenna to be described is completely original and to the writer's knowledge has not been described in any local or overseas journal. We have "ZL Specials" and "G8PO antennas" and, for want of a name, this antenna might be called the "extended lazy H." Several years ago a conventional lazy H antenna was cut for 14 Mc. and installed at VK2SA. This aerial consisted of two horizontal collinear elements stacked and separated a half wavelength. The top of the array was supported by two 41-foot masts, thus leaving the bottom section only 9 feet above the ground. The effective height of this type of antenna is measured from the halfway point between top and bottom elements and thus, in this case, the effective height was about 25 feet. The observed effectiveness was only about equal to a full-wave Zepp 41 feet high.

Attention was then directed to the possibilities of the "extended double Zepp" described in *QST* for June, 1938. The height of one mast was increased to 45 feet, to compensate for ground slope, and the antenna was cut for 14 Mc. and erected for NE-SW directivity. Improved effectiveness by comparison with the full-wave antenna was apparent on 14-Mc. W contacts. In addition, some excellent 'phone contacts were made on 7 Mc. with W stations. Results on 21 Mc. indicated a number of major lobes that gave good DX contacts. From the results it would appear that this type of antenna possesses the desirable feature of good effectiveness on several amateur bands. The gain of the extended double Zepp is given in most textbooks as 3 db.

The theoretical gain of the conventional lazy

H antenna is given as close to 6 db., but it was considered attainable only if it could be supported about 70 feet in the air, so that the bottom elements were at least a half wavelength above ground. This was impossible with the existing masts. Consideration was then given to the possibility of adding two additional extended half-wave lower elements to the extended double Zepp. The additional elements were connected

Fig. 1—Dimensions of the "VK Special" 7-, 14- and 21-Mc. beam antenna of VK2SA. Whether the antenna coupler will be series- or parallel-tuned will depend upon the length of the feed line and the band in use. At VK2SA the upper wire is 40 feet above the ground.

21 feet down on the feed line,<sup>1</sup> as shown in Fig. 1, and the feed line was transposed to give the proper phasing.

Results with the modified antenna were very gratifying, as was the ability to operate readily on three bands with the one antenna system. Although the directional characteristics on 21 Mc. are not yet known completely, the signal reports indicate the presence of major lobes giving good general coverage. On 7, 14 and 21 Mc. an antenna tuner is used, and an open-wire line with 4-inch spacing is used between tuner and antenna.

On 14 Mc. the antenna has outperformed all previous wire antennas tried out for W contacts on both long and short paths. The lower two elements were added to the extended double Zepp on December 19, 1954, and numerous W 'phone contacts have been made since that date. The majority of the signal reports are S8 and S9, and nothing below S6 from East Africa. The power input to the transmitter is 75 watts.

An analysis of all signal reports indicates equal if not better performance compared with rotary beams, and it would appear that the gain exceeds 6 db. Comparison reports have also been made by the simple expedient of removing the two lower elements—the antenna then becomes an extended double Zepp—and the signal was reported to drop 2 and sometimes 3 S points.

\* 106 Flora St., Kirrawee, Sydney, N.S.W., Australia.

<sup>1</sup> The point 21 feet down the feed line is a voltage loop, and one would normally connect half-wavelength elements at this point for in-phase drive of all elements. The modification by VK2SA is not the simplest array to analyze, but in view of his excellent results it is thought to be of considerable interest.—Ed.

# The Simplest Converter

*A One-Tube Design for Reception on 15, 10, 6, 2 or 1 1/4 Meters*

BY MASON P. SOUTHWORTH, W1VLH

• A common request showing up in mail for the ARRL Technical Information Service in recent years has been, "Where can I find information on a simple converter for 21, 28, 50 or 144 Mc., not crystal-controlled?" Seems that there are plenty of beginners, and not a few old-timers too, who want to receive on one or more of these bands without going to something complicated or tough to build. Here's the answer, and then some — a one-tuber that provides usable reception on 21, 28, 50, 144 or 220 Mc. You can cover 15, 11 and 10 meters without changing coils.

To a fellow getting started in ham radio, or even some new phase of the game, life can seem pretty complicated at times. A lot of the gear described in the magazines looks very nice and undoubtedly works well, but is just too complicated or takes too many hard-earned parts for beginners to think about building it. Here's a converter that was designed with these fellows in mind. It uses as few parts as is practical and construction is simple and straightforward. It also covers a lot of territory. You can build it for 21, 28, 50, 144 or 220 Mc. You can use it to listen in on any v.h.f. band, or to improve your reception on 15 or 10 meters, where many of the lower-priced commercial receivers fall short. The output frequency can be anywhere in the 40-meter region, and almost any receiver that tunes this range will do for the i.f. system.

◆

The "simplest converter" with its power supply attached. Latter may be eliminated if power is taken from the receiver with which the converter is to be used.

◆

You may have noticed that we haven't referred to this design as a multiband converter. You just can't have all those bands at once and simplicity too. Wide frequency coverage by means of switching or plug-in coils nearly always involves performance compromises, even at 50 Mc., and it is practically out of the question for 144 or 220 Mc. Bandchanging in this case is accomplished by removing two coils and soldering in a new pair. This approach doesn't lend itself to hopping around the spectrum, but it's hard to beat for simplicity and performance on any one band. Four coil sets are shown. One pair covers 15, 11 and 10 meters while the other three sets are for 6, 2 and 1 1/4. If the thought of soldering and unsoldering worries you, the converter is so simple that you can always build another for a second favorite band.

Perhaps the best way to describe a piece of gear like this is to state what it will do and what it won't. It will give usable reception on all the above bands. The noise figure does not represent the ultimate by any means, but you will hear all but the weaker ones on 144 and 220 Mc., and sensitivity on the lower bands will equal that of all but the best communications receivers. Stability is satisfactory after a warm-up period; good enough for c.w. reception, even on 144 Mc. Image rejection is low on 144 and 220 Mc., of course, but this is not often troublesome in actual operation. If this sounds like something you could use, let's see how little it takes to do the job.

A glance at the circuit diagram, Fig. 1, shows that only one tube is used, a 6J6 dual triode. One

 220 Mc. — Hairpin loop of No. 12 tinned wire,  $\frac{3}{4}$  inch long,  $\frac{3}{8}$  inch wide with  $\frac{3}{8}$ -inch leads, c.t. Connect C<sub>5</sub>  $\frac{5}{8}$  inch from capacitor terminals; see photo.  
 L<sub>3</sub> — 24 turns No. 24 enamel on  $\frac{3}{8}$ -inch iron-slug form (National XR-91).  
 L<sub>4</sub> — 4 turns No. 24 d.c.c. or enamel at cold end of L<sub>3</sub>.  
 J<sub>1</sub>, J<sub>2</sub> — Phono jacks (Cinch 81B or two Cinch 81A single jacks).  
 J<sub>3</sub> — 4-contact male chassis fitting (Amphenol 86RCP4).  
 J<sub>4</sub> — 4-contact female chassis fitting (Amphenol 78RS4).  
 P<sub>1</sub> — 115-volt line plug.  
 S<sub>1</sub> — S.p.s.t. toggle switch.  
 SR — 20-ma. selenium rectifier (Federal 1159).  
 T<sub>1</sub> — Power transformer, 150 volts at 25 ma.; 6.3 volts at 0.5 amp. (Merit P-3046).

half is the mixer, with its grid circuit, L<sub>1</sub>C<sub>1</sub>, tuned to the signal frequency. This circuit requires repeaking only with relatively wide shifts in frequency, once adjusted for the band in question. The mixer plate circuit L<sub>3</sub>C<sub>7</sub> is tuned to the intermediate frequency, about 7 Mc., and once adjusted is left alone. The second half of the 6J6 is a tunable oscillator. Energy from it beats with the signal in the mixer to produce the intermediate frequency. Its frequency is determined by the C<sub>5</sub>C<sub>6</sub>L<sub>2</sub> combination. The split-stator capacitor C<sub>6</sub> is used for actual tuning; the trimmer C<sub>5</sub> is for band-setting and to increase the bandspeed. That's all there is to it.

How much? The whole works will set you back less than \$15.00 even if you buy all the components new. Power can be taken from the communications receiver in most cases or, for about \$6.50 more, you can add a small selenium rectifier supply which could come in mighty handy around the shack to run various other small pieces of gear. This is shown at the right side of Fig. 1.

### How To Build It

Construction of the converter is simplicity itself. Everything is mounted on a standard 5  $\times$  7  $\times$  2-inch aluminum chassis (Premier ACH-426) and there are no special brackets to bend or buy. Fig. 2 is a layout of the chassis showing the location and size of every hole. The front

view photograph shows the tuning capacitor, C<sub>6</sub>, on top of the chassis with the trimmer (C<sub>5</sub>) and 144-Mc. coil soldered in place. The feed-through bushing near the edge of the chassis serves as a tie point for R<sub>3</sub> and holds the coil rigidly in position. Immediately behind C<sub>6</sub> the 6J6 and the tuning adjustment for L<sub>3</sub> are visible. The dial is a National type K. Note that a large knob (National type HRT-M) has been substituted for the one that comes with the dial to smooth out the tuning. The dial index has been mounted below on the front wall of the chassis instead of above, for obvious reasons, though you may prefer to add a panel in the usual manner. The 0 to 100 scale may be used for logging if you don't mind reading it upside down, or a calibration may be drawn on stiff white paper and cemented to the dial surface. The small knob to the left is the mixer grid circuit trimmer, C<sub>1</sub>.

A power supply is shown plugged into the back of the converter. If the power plugs are positioned so that this is possible, it will save making up a connecting cable. This supply, built entirely within a 4  $\times$  2  $\times$  2-inch utility cabinet, was described in more detail in *QST* for June, 1955.<sup>1</sup> The layout is not important, and it can be built in some other form if desired. If your receiver has an accessory socket there is no reason to use a separate power supply, as the

<sup>1</sup> Tilton, "Six Meters for the Beginner, Part II," *QST*, June, 1955.

drain of the converter is very low. Check your receiver instruction book for the required plug connections.

The various components visible in the bottom view have been labeled for ease in identification. Most of the small parts are grouped around the tube socket near the center of the chassis. There is very little wiring to be done other than soldering in these resistors and capacitors by their leads. Below the tube socket are the slug-tuned  $L_3$  and a two-terminal tie point supporting  $R_4$ .  $L_3$  is held in place by passing its leads through holes in the plastic rings supplied with the XR-91 coil form.  $L_4$  is wound around the by-passed end of  $L_3$  and is cemented or doped in place. Its leads are then twisted and run over to the output connector on the back of the chassis. If the dual connector shown is not available, two standard phono jacks can, of course, be substituted.

The mixer grid circuit is visible above and to the left of the tube socket.  $C_1$  is mounted on the front wall of the chassis and  $L_1$  is soldered across its terminals. A short piece of coax (RG-58, U or RG-59/U) is run from the input connector to the grid circuit. Here the braid is grounded to the rotor of  $C_1$  and the inner conductor is tapped onto  $L_1$  in the proper place. Note the two  $\frac{3}{8}$ -inch holes drilled between the tube socket and the tuning capacitor. These are for the leads from  $C_4$  and Pin 1 of the 6J6. These should pass through the chassis near the centers of the holes. The tube socket should be mounted as shown with Pin 1 adjacent to the large hole near the middle of the chassis.

The third photograph shows the coils for 15, 10, 6 and  $1\frac{1}{4}$  meters, the 2-meter coils being on the converter when the pictures were made. The oscillator coils with their trimmers ( $C_5$ ) and decoupling resistors ( $R_3$ ) are in the back row, and the mixer grid coils are in the front row. It is not necessary to use separate trimmers for each oscillator coil, of course, but doing this eliminates the need for readjustment when changing coils. The use of separate decoupling resistors does away with repeated soldering to the coil center

Fig. 2 — Layout drawing of the converter chassis, showing size and location of all holes.

tap. The coils for 50 Mc. and below are made of sections of B & W Miniductor. It will be easier to solder to these if the turns each side of the desired one are bent toward the center of the coil. The higher frequency coils are made from No. 14 wire as described in the parts list.

The oscillator capacitor,  $C_6$ , was modified slightly to secure more bandspread on the higher ranges. The end stator plate and the last two rotor plates of each section should be removed by twisting carefully with long-nosed pliers. This leaves four stator and three rotor plates in each section. If the converter is to be used on 144

Bottom view of the converter, showing the principal parts numbered as they appear on the schematic diagram.

Coils for the one-tube converter. Top row are the oscillator coils, with trimmers ( $C_5$ ) attached. Corresponding mixer coils below. Left to right, sets for 21 to 28 Mc., 50 Mc. and 220 Mc. The 144-Mc. coils appear in the converter photographs.

or 220 Mc. only, the bandspread may be increased by removing more plates, but it is advisable to leave them on until the proper frequencies are found.

### Making It Work

The first step in getting the converter going is to obtain suitable power for it. The requirements are 6.3 volts at 0.45 amp. and 75 to 100 volts at about 12 ma. These voltages should be borrowed from the receiver, if possible. Simply bring out leads from the filament circuit, some high voltage point, preferably regulated, and, of course, a connection to the chassis. This is easy if your receiver has an accessory socket. If you don't want to dig into the receiver, and no other suitable supply is available, the simple selenium rectifier unit described above will do the job. The output of this supply is about 125 volts.

The mixer was found to have the best noise figure with a plate voltage of about 75, so  $R_4$  was made a suitable value to provide this drop. If a different supply voltage is used it may be necessary to change the value of  $R_4$  to reduce the mixer voltage to about 75. This is not critical, though, and anything 20 volts or so either side is perfectly satisfactory. Even a 90-volt "B" battery will do the trick.

After settling the power supply question, apply filament voltage and see that the 6J6 heater lights up. Now apply plate voltage. The first check should be to see that the oscillator is working. If a milliammeter is available (10 to 100 ma. full scale will do) connect it in series with  $R_3$  to measure oscillator plate current. This should be somewhere in the neighborhood of 6 ma. and should rise when the oscillator coil,  $L_2$ , is touched with a pencil lead. If it is much higher, and does not change, the tube is not oscillating. Recheck the oscillator wiring for a mistake, or try another 6J6.

The frequency of the oscillator may be checked in several ways depending on what is available in the way of test equipment. A calibrated receiver can be used to detect the oscillation and show its frequency. The surest system is to use a grid-dip meter operating as a wavemeter, or an absorption-type wavemeter with fairly accurate

calibration. The grid-dip meter will show output when coupled to  $L_2$  and tuned to the frequency of the oscillation. Tuning an absorption wavemeter coupled to  $L_2$  to the oscillator frequency will cause a flicker in oscillator plate current. At 220 Mc. it is also possible to use a Lecher wire system to measure the frequency as outlined in the measurements chapter of all recent *Handbooks*.

The oscillator should be adjusted (by  $C_5$ ) to tune below the desired signal frequency by the amount chosen as the i.f. For the 21-Mc. band the oscillator tunes at least 14 to 14.45 Mc. For 28 Mc. it should cover at least 21 to 22.7 Mc. For the 6-meter band it must tune 43 to 47 Mc., and so on. The trimmer capacitor,  $C_5$ , and, if necessary, the coil,  $L_2$ , are adjusted to set the oscillator to the proper range. Actually coverage will be somewhat more than the width of the band, and the desired range should be centered on the dial by varying  $C_5$ . The coverage mentioned above is obtained by rotating  $C_6$ , of course.

Now it's time to connect the converter output to the receiver antenna terminals. The converter is normally operated on top of the communications receiver, or close alongside it, in a convenient operating position. A coaxial cable is made up with a male phono-type coaxial fitting on one end, with enough cable to reach from the converter to the receiver antenna terminals. Most receivers have a three-terminal antenna connection block. One of these terminals is grounded. The middle one and the one at the opposite end from the grounded one are normally used for doublet antenna connections. Connect the middle one and the grounded terminal together, and make this combination the point of connection for the outer conductor of the coaxial cable. The inner conductor goes on the remaining antenna terminal.

The mixer plate coil,  $L_3$ , may be tuned to about 7 Mc. with a grid-dip meter, or it can be peaked on noise with the receiver set at this frequency and the converter running. The grid circuit,  $L_1C_1$ , may be checked with a grid-dip meter. It may also be peaked for maximum response to a signal generator connected to the

# Wait and See

BY ROBERT D. REED,\* WSKY

PEOPLE have a peculiar ability which probably is the world's best method for an adult to get his left foot into his right ear by way of his mouth. This ability combines the faculty of speech with the idea that firm opinions on subjects are not only necessary but must be defended to the last ditch, the last shell, and the last 807.

*Genus Homo Sapiens (sub-phyllum Hammus Electronicii Radioicus)* is particularly adept at having opinions plus the ability to spray them loudly over the world by virtue of his super blaster-band ear buster running a jillion watts to a whang-doodler of an antenna which has major lobes in 360 directions. Defense of said ideas and opinions may be audible or by certain rhythmic undulations of the fingers in cooperation with a key.

It is a brave man who approaches Hammus with the idea of changing his opinion on: (1) politics, (2) religion, (3) the peerless qualities of his children, (4) the fire-snorting dash and performance of his Detroit gasoline-burner eight, (5) the best way to enhance further the state of ham-band QRM, and (6) either side of the s.s.b. vs. a.m. controversy. The amateurs doing the most and best with their hobby, we think, are those keeping clear of the fray. . . . It's best of all to wait and see.

He who ventures forth on any of the items from (1) through (5) is the victim of simple assault and can usually be patched up with some salve and a few bandages placed in strategic spots. But that number (6)! Murder and mayhem are mild in comparison with what happens to the innocent venturer forth on that subject. His antenna vanishes in a cloud of green smoke. His receiver melts into a blob of assorted steel, copper, glass and aluminum. The antenna relay breaks down and the surge into his transmitter completely discombobulates it back to the VFO.

Old Growler, licensed prior to 1920, sagely nods his head when he hears such goings on. Listen carefully as he mumbles softly to himself. Long, long ago he learned of the hazards of speaking loudly about differences of opinion.

Heh! Heh! Beats all how history repeats. Like in the early Twenties, just like 'em! When I think how brave those little 210s and VT1s and VT2s were as they looked the kilowatt sparks straight in the eye with their innocent little chirps, I'm surprised all over again. It took a whale of a lot of convincing for me to get it into my thick skull that a little five- or ten-watt chirp could run circles around my big old spark rig. It didn't seem possible that something that just sat there and glowed could work. Seemed as if it just had to make some noise. But I was young then, and pretty dad-burned stubborn. (Got my come-

uppance though just as lots of young fellows now-a-days might get theirs.)

Never will forget the night that Old Joe called me on the land line to ask me to take a look at his new 210 rig. It was cold and clear and signals

were rolling in like mad. Old Joe had moved his rig into the kitchen, now that the rotary gap didn't make so much household QRM. His XYL met me at the door and took me to the kitchen where Old Joe grinned at me over the coffee pot and waved me to a chair beside him as he threw the switch to the "transmit" position.

As he tapped out the call of the station he was working I nearly fell off of my chair! He was working more than 1800 miles with that quiet little fugitive from an electric light factory! I had thought Old Joe was kidding but I sure got convinced when he turned it over to his contact. By gum, he *was* in contact with him!

I had planned to stay just a little while and then get back to the home rig to stop fooling around and work some DX. Seems funny now but DX to me with my old kilowatt spark was about 1000 miles. This business of working 1800 miles needed looking into. So I looked, but did I catch it from the XYL when I got home in the wee small hours. She even smelled my breath to verify my story.

That night of DX in the pleasant warmth of the kitchen at Old Joe's made a cautious convert of me to the tune of a 210, some coils, condensers and such, which I tied to my antenna. My little chirp added to those already hunting for better and better DX. I had to learn to tune my receiver all over again and learn how to get away from pesky capacity effects which came as I reached for the dial to touch up the receiver. I learned! But in the meantime, dust began to gather on the old spark rig.

After a few weeks, Old Bill, who had a spark like mine across town, was having coffee with me at the local beanery. He was not as free and easy with me as he used to be. I found out what was wrong when I began to tell him about that innocent looking little 210 and the contacts I was

# Tuning the Mobile Antenna from the Driver's Seat

## *A Simple Remote Tuning System*

BY FRANK T. MORGAN,\* W7RFG

• Various items from military surplus units can be combined to provide a means of easily resonating the mobile whip antenna from the driver's seat.

THE writer has expended his share of time and energy in trying out the usual arrangements of mobile installation — transmitter under-dash mounting and trunk mounting, antenna with base loading and center loading, direct coupling and the tapped-coil method (shunt feed), and the usual array of tuning slugs and capacitive hats. The result was considerable frustration and a family gas buggy with enough holes in the body to make a car dealer shudder.

For ease of operation, it was finally decided that the transmitter had no place in the trunk, but belonged up front in constant range of the operator's hand and eye. Furthermore, after shattering an overhead fluorescent lamp in a filling station one night, with a cowl-mounted job, the antenna was transferred to the rear bumper as the only safe place for an 8-ft. whip.

The ability to QSY more than a few kilocycles on any band with such an arrangement was a hopeless dream, nursed in despair for a long time. The usual procedure is to tune up before the car is put in motion, and then stop a couple of times to adjust the antenna to compensate for the change in capacitance as the wind bows

\* Route 2, Box 42, Myssa, Ore.

the whip backward. When it is desired to QSY, the procedure must be repeated. (This sort of stuff can lead to divorce if the XYL is along expecting an uninterrupted Sunday drive.)

### *A Convenient Tuning System*

The remote tuner described has solved this problem well, and the author is now at peace with himself and the family. No cross words from the XYL, even after miles of rag-chewing on 75 meters. The antenna is tuned by a variable inductor connected at the base of the antenna, and driven remotely from the driver's seat by means of a flexible shaft. The number of turns needed to cover the 75-meter band is so small that it has little effect on the performance of a center-loaded antenna. Some commercially manufactured tuners, similar in principle, employ reversible d.c. motors for rotating the coil. If a suitable motor and reduction gears are available, fine, but for economy and downright simplicity, the flexible shaft is hard to beat.

To facilitate accurate and easy tuning, a resonance indicator that may be placed within view of the operator is included.

The tuning mechanism consists of the rotocoil and associated rider, springs and a bakelite strip taken from the antenna circuit of a BC-696. Since only about 12 turns are required to cover the band, the coil from a BC-457 may also be used. The BC-696 is often converted for 75-meter components may be simply transferred from the BC-696 to the antenna tuning unit. A coaxial

The remote antenna-tuning unit, showing the mounting of the link coupling coil. The thermocouple for the r.f. ammeter and its pick-up transformer are in the foreground.

cable is then used between the antenna tuner and the output link of the BC-696.

The BC-442 Command antenna-relay unit (another available surplus item) offers a meter with an external thermocouple that can be used in the remote resonance indicator. If the mounting plate for the BC-442 can also be obtained, it makes an ideal mounting for the tuning unit that can be removed simply by releasing the four slip catches which clamp on the shock mounts.

### Construction

To begin the construction, completely dismantle the BC-442, and remove the studs to which the cover is fastened, by twisting them out with pliers. The studs on the flanges under the base plate were left intact so that a cover could be mounted over the assembly in case trouble developed from dirt on the rider contact. So far this has not happened. It will be found that when the coil is mounted with one side flush with the edge of the base, and the bakelite mounting strip for the rider and springs is mounted about  $\frac{1}{4}$  inch in from the opposite side, the rider will fit the coil with about the right amount of tension. The rider-spring mounting screws pass nearly through the bakelite strip. The chance of a short can be reduced by mounting the strip over a sheet of mica, fiber or pasteboard cut to size.

It will be observed that the ungrounded, or floating end of the coil has a pressed aluminum mount. This plate is large enough to accommodate a coax receptacle if one of the four corners is sawed off flush with the threads. It was feared that the plate would be twisted or weakened if the receptacle were mounted in the usual manner, so a  $\frac{7}{16}$ -inch hole was drilled for a center, and the fitting mounted flush against this support.

To the coil hub at this end is soldered a short length of brass rod to which the flexible shafting can be connected with a small coupler. This hub looks something like aluminum or pot metal, but it is actually tinned brass and solders very easily if a heavy soldering iron is used.

The pick-up transformer,  $L_1$ - $L_2$ , for the resonance indicator consists of one turn of wire on each coil, wound on a ceramic form around a powdered iron slug. This transformer is mounted at the end of the bakelite strip, near the ground end of the rotocoil, with a machine screw passed up from below the base. The thermocouple can be mounted directly over the rider-spring strip, between the two springs. The mounting screws will have to be slightly longer than the ones that originally mounted the thermocouple. One turn of the transformer is connected between the cold end of the rotocoil and ground. The other turn is connected to the thermocouple terminals marked "line." Use a small solder lug on the wire going to the rotocoil.

### Matching

In matching the antenna to the line, several methods might be used. The author has tried

paralleling two or three lengths of RG-8/U to reduce the line impedance. While a match can be obtained in this manner, difficulty is usually encountered in getting sufficient coupling from the transmitter output to such a low-impedance line, especially with the pi-section output circuits

Fig. 1—Schematic of the remote antenna tuning system. TC is an external thermocouple for the r.f. ammeter mounted on the instrument panel.  $L_1$  and  $L_2$  form the pick-up for the r.f. ammeter.

so popular in manufactured mobile rigs. Shunt feed with a separate matching coil at the base of the antenna is feasible, but the most simple and satisfactory arrangement tried consists of a link coil coupled to the ground end of the rotocoil.

In constructing the coupling link coil, it was found that 3 turns of No. 14 could be fashioned so that when one end is grounded, and the other end fastened to a  $\frac{1}{2}$ -inch stand-off insulator, no other support was necessary. A more rugged and professional-looking job might be done by fastening the turns together at several points with sealing wax or poly spacers. The link is mounted so that it clears the rotocoil by about  $\frac{1}{16}$  inch, and the turns are spaced about the same distance. The link should overlap about 5 turns at the end of the rotocoil. It will be necessary to remove the solder lug and lead to the thermocouple transformer, and also the end mounting of the rotocoil in order to slip the link coil over the rotocoil. A short length of stranded wire is soldered to the lug on the end of one of the rider springs, and a small banana plug is soldered to the other end to connect to the antenna mount.

### Installation

The unit described is small enough that it can be mounted in the trunk, close to the base of the antenna, without interfering with the use for which the compartment was intended. A ground should be made to the car body with a short length of copper braid.

The flexible shaft and tuning head from an SCR-183 were used to drive the coil. This was passed forward under the car and up through a hole under the front seat. The tuning head was mounted on the hump in the center of the floor,

# "Little Oskey"—A Monitoring Oscillator and Keyer

## *A Simple C.W. Break-in Monitor and Code-Practice Oscillator*

BY E. LAIRD CAMPBELL, W1CUT

• This is a versatile auxiliary unit that will be welcomed to many an amateur shack. Without modifying a receiver or cathode-keyed transmitter in any way, and without the need for extra r.f. pick-up, it blanks the receiver and injects a sidetone in the headphones when the key is down. It can also be used as a code-practice oscillator, on those occasions when you can't find anyone to QSO.

SEVERAL different methods of c.w. monitoring have been tried at W1CUT. The first, and most simple, involved lowering the gain control of the receiver to a comfortable level while transmitting. However, even with the gain turned down it was difficult to reach a pleasant listening point, and constant adjustment was required. If the station being worked happened to be off the transmitting frequency, it was impossible to monitor without retuning the receiver to the transmitted signal.

The second method for c.w. monitoring made use of a crystal diode to rectify r.f. from the transmitter. The rectified voltage keyed a neon bulb audio oscillator and produced a sidetone. This system proved unsatisfactory because severe TVI was produced by harmonic generation in the crystal diode.<sup>1</sup> Since the r.f. for the unit was obtained from a pick-up wire near the final amplifier there was the danger of high voltage, and when changing bands it was necessary to alter the position of the pick-up wire to obtain sufficient r.f. to operate the unit. Since none of the above monitoring systems proved satisfactory, it was decided to construct a break-in monitor which basically had two jobs to perform. When

<sup>1</sup>"Harmonic Radiation from External Nonlinear Systems," *QST*, January, 1953.

the key was down the receiver output would be completely squelched and a sidetone would appear in the headphones, and when the key was up receiver output would be fed through to the headphones. Provisions must also be made for:

- 1) No adjustment when changing frequency or bands.
- 2) Installation in station without revision of transmitter or receiver.
- 3) A sidetone that is keyed exactly as the transmitted signal.
- 4) Keying the transmitter and sidetone simultaneously.
- 5) Mixing the outputs of the receiver and sidetone oscillator.
- 6) Electronic switching from sidetone to receiver output.
- 7) Switching the monitor out for the purpose of zero-beating another signal.

The monitor described here can perform all of the above jobs. Since the unit needs no external excitation, it can also be used as a code-practice oscillator.

### *Circuit and Construction*

No special precautions are necessary in laying out the unit. In fact, the monitor may be built in a cabinet and placed alongside of the receiver. When wiring the unit, it is a good idea to keep the leads carrying a.c. away from the amplifier input to prevent hum. Care should also be taken when soldering the crystal diodes. Holding the diode leads with a pair of long-nose pliers while soldering is good insurance against ruining a crystal. Terminal strips can be used conveniently for mounting parts such as the selenium rectifier and to serve as tie points for resistors, capacitors, etc.

Two small 6-volt filament transformers connected "back to back" are used for obtaining

C.w. monitor and code-practice oscillator.

**QST** for

Bottom view showing the connecting cable. The crystal diode voltage tripler can be seen in the upper left corner of the chassis.

the necessary operating voltages. A novel voltage tripler composed of one-half of the 12AU7 and two crystal diodes supplies the voltages for receiver squelching and the audio oscillator. This voltage is controlled by the transmitting key and is turned on when the key is closed. At this instant (when the key is closed) the sidetone is produced and the receiver is squelched by placing the negative voltage on the grid of the input amplifier tube. When the key is opened the received signal is amplified and heard in the 'phones, while the sidetone is off.

The frequency of the sidetone audio oscillator can be adjusted by changing the grid capacitor,  $C_1$ . If the audio oscillator fails to oscillate, the primary leads of the interstage transformer should be reversed.

High voltage is obtained from the 115-volt side of transformer  $T_1$ . This is followed by a selenium rectifier and  $RC$  filter which provides enough voltage for good amplification in the amplifier-mixer stage.

### Operation

It is a very simple matter to insert the monitor into an existing station. The cable from the unit is plugged into the keyed circuit and the receiver output and head-phones are plugged into the unit. Switch  $S_1$  is a s.p.s.t. switch on the volume control and is used to turn the unit off and on. If for some reason it is desired to operate temporarily without the unit (such as when zero-beating) the toggle switch,  $S_2$ , may be opened and

## More Power with the AT-1

### Simple Modifications for Greater Output

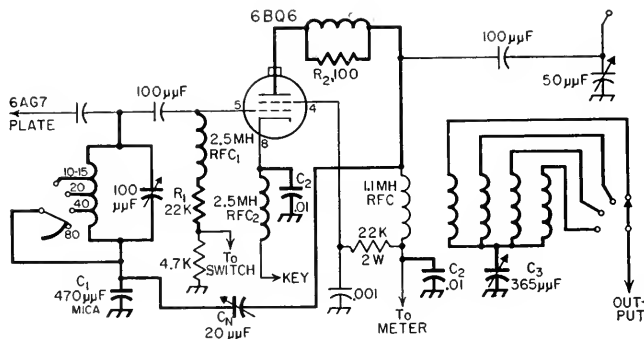

BY LEWIS G. McCOY, WHCP

• By a few simple modifications, the power output of the Heathkit AT-1 can be raised two to three times. Any Novice who has built the rig and used it long enough to become familiar with its operation should be ready for the slightly more complicated circuit. This article gives step-by-step directions.

**L**ISTENING to the Novice bands for a short time will quickly convince anyone the Heathkit AT-1 transmitter is a very popular item. As it stands, the rig will handle approximately 30 watts input on all amateur bands, 80 through 10 meters. Its amplifier works straight through on 80, but

having been designed for loads much higher than 100 milliamperes, will not deliver much more than 35 watts. The plate voltage drops as higher current is drawn and one runs into the law of diminishing returns.

In order to use the second stage as a straight-through amplifier it is necessary not only to install a neutralizing circuit but also to change the oscillator coil and switching circuit to permit tuning the amplifier grid and plate circuits to the same frequency. This should be done on all bands with the exception of 10 meters, where the change is not worth while because the oscillator cannot deliver sufficient grid drive on that band from a 7-Mc. crystal. If a 6BQ6 is to be substituted for the 6L6 — a change that is recommended, and

*Fig. 1* — Circuit diagram of modifications for the AT-1. The changes are shown by the heavy lines.

on all other bands it acts as a frequency doubler, presumably to avoid the necessity for neutralizing the 6L6. Although this results in a simpler circuit, it also means that the power output is considerably less than could be obtained from the same 6L6 as a straight-through amplifier.

To operate the amplifier straight through, the 6L6 (and practically any tube that might be substituted for it) must be neutralized to prevent self-oscillation. Neutralizing is neither difficult nor expensive, and the additional power output is certainly worth the effort.

Just how much the power output can be increased by such a change is shown by Table I, which gives the results of measurements made on a modified AT-1 *vs.* the unmodified unit. The table also includes data on a 6BQ6 which was substituted for the 6L6, this tube having been tried because its characteristics indicated that it should be a better performer than the 6L6. A 6L6 was also tried in the hope that its ability to draw large plate current with relatively low plate voltage would result in greater output but, unfortunately, the power supply in the AT-1, not

is included in the instructions below — the amplifier socket also must be changed.

### Other Modifications

In the original version of the AT-1, the output links are fixed, with no means provided for adjusting the coupling. According to the instruction manual, the links are designed to work into a 50-ohm load.

With certain types of antennas and antenna couplers, a fixed link may be OK for the job, but in many cases, it is well-nigh impossible to load the output stage to the normal input. A variable coupling circuit is therefore a very much worthwhile addition, and since it requires little more than adding an inexpensive variable capacitor, it is included in the modifications described below.

Another change that can easily be made consists of adding a resistor between the oscillator screen and chassis ground to help stabilize the voltage on the oscillator screen. This results in better keying characteristics.

The modifications described below are arranged in a series of steps, each numbered. The

component designations referred to are the same as those given in the original Heathkit instructions. The circuit diagram, Fig. 1, is the modified circuit showing only the information necessary for the changes. A list of material needed for the modifications is given elsewhere in the article.

Oscillator Modifications

- 1) Unsolder the leads from SB1, 2, 3, and 4.
  - 2) Unsolder the lead from XC1 to CO1 and also the lead to CO2A. Unsolder the leads from XC1, 2, 3, and 4 and clean the solder from the terminals.
  - 3) Remove CO from the panel.
- Note: In some of the AT-1 units the oscillator capacitor is insulated from the panel while in other models the rotor shaft of the capacitor is mounted directly on the panel. If your unit is the type with the insulated mounting, you can omit Step 4 and the use of insulating washers described in Step 7. (Check parts list for correct type of capacitor needed.)
- 4) Enlarge the panel hole for capacitor CO to 1/2-inch diameter.
  - 5) Drill a 1/8-inch diameter hole in the chassis top one inch in from the panel and one inch to the left of the large opening in the chassis.
  - 6) Mount a one-lug terminal strip at this new hole.
  - 7) Mount the new 100-μf. variable in the position formerly occupied by CO using an insulating washer on each side of the panel.
  - 8) Unsolder the end of the oscillator coil winding from terminal No. 1.
  - 9) Unwind the top turns from the coil down to the first tap point but do not remove or cut the wire; then drill or punch a small hole in the coil form approximately 1/4 inch below terminal No. 2.
  - 10) Unsolder the 2-wire tap from terminal No. 2 and solder the two wires to terminal No. 1.
  - 11) Wind three turns back on the form, and at the point where the third turn is opposite the new hole carefully scrape the enamel from the wire.
  - 12) Using a 3-inch piece of No. 18 tinned wire, feed the end of the wire down through the top of the coil form and out the new hole. Solder the end of the wire to the point where the enamel was removed from the third turn.
  - 13) Draw the other end of the wire through terminal No. 2 and solder to the terminal, trimming off any excess length.
  - 14) Wind the remaining wire from the coil back on the form and bring the end through the hole immediately below terminal No. 3, then dress the end of the wire over to and through the hole opposite terminal No. 2. This point will

TABLE I  
Measured Input and Output Power of the AT-1  
Before and After Modification

Band	6L6 Amp. Unmodified *		6L6 Amp. Modified		6BQ6 Amp. Modified	
	Input, Watts	Output, Watts	Input, Watts	Output, Watts	Input, Watts	Output, Watts
80	26	9	27	18	35	25
40	27	9	27	15	35	25
20	27	9	27	15	35	23
15	34	5	31	10	35	22
10 **	29	7	31	7	35	8

\* Output coupling not adjustable.  
\*\* The amplifier is a frequency doubler in all three cases on this band.

R.f. measurements made with a Jones MicroMatch, 260 series, power with the transmitter coupled to a 50-ohm resistive load. Power input in each case by actual measurement of plate voltage and plate (not plate and screen) current.  
Maximum plate current for the 6BQ6 is approximately 90 ma. With a plate voltage of approximately 400 volts, this gives an input of 35 watts. The screen current with this tube is very low so that the current registered by the AT-1 meter (which measures combined plate and screen current) is very nearly the same as the plate current alone.

- be designated terminal No. 5. This completes the coil modifications.
- 15) Mount the coil back in place.
  - 16) In the original instructions, Pictorial 1 shows a lead connected from SB3 to the tinned wire between TB2 and TC1. Unsolder and remove this lead (not the lead between TB2 and TC1).
  - 17) Cut an 8-inch length of No. 18 tinned wire and solder one end to the same point on the TB2-TC1 lead as the short piece formerly occupied.
  - 18) Bring the wire up through the large opening in the chassis and bend it toward the oscillator capacitor. The wire should clear the top of the chassis by approximately 1 1/2 inches. Dress the lead over to the stator terminal of the oscillator capacitor. Bend the wire at this point so that the end dresses up to XC5. Solder the wire at the stator terminal and to the end of the coil at XC5.
  - 19) Feed the end of a 9-inch length of tinned wire through XC4 over to SB4 and solder the end to SB4. Draw the wire tight and solder at XC4. Feed the free end of the wire

View showing the modifications of the amplifier and output circuits. The neutralizing capacitor is visible just to the left of the 6BQ6. The output coupling capacitor is at the upper left-hand corner of the panel.

through the insulated lug on the one-lug terminal strip mounted in Step 6. This lug is designated TP2. Draw the wire through TP2 and bring the end up to the rotor side of the oscillator capacitor. Slip a piece of spaghetti insulation over the wire and make it long enough to cover the wire between the rotor terminal and TP2. Solder the connection at the rotor terminal but not at TP2. The length of the wire between XC4 and TP2 should be dressed so that it does not touch nearby objects.

20) Connect one lead of a 470- $\mu$ mf. mica capacitor to TP2 and solder the other lead to chassis ground. The ground connection can be made at the screw which holds the TP2 terminal strip to the chassis.

21) Using short lengths of No. 18 tinned wire, connect one lead between SB3 and XC3, one lead from SB2 to XC1, and one lead between SB1 and XC2. Solder all connections and be sure that no lead touches another. This completes the oscillator modifications.

### ***Amplifier Modifications***

22) Remove the r.f. choke from between TC3 and Pin 3 of the 6L6 socket. Also unsolder the end of the 100- $\mu$ mf. capacitor from Pin 3.

23) Drill a  $\frac{1}{8}$ -inch hole in the chassis top  $\frac{1}{2}$  inch from the side and opposite the  $\frac{1}{2}$ -inch hole near the tube socket.

24) Mount a three-lug terminal strip at this new hole. The lug closest to the panel is designated TPA1, the middle lug TPA2, and the rear lug TPA3.

25) Unsolder the 47K resistor from B5 and TC2.

26) Unsolder the 0.001 capacitor from B8 and chassis ground. Also remove the lead from B8 to J1. Clean the solder from B8.

27) Cut the bare wire lead between B1 and B2 and clean the solder from B1. B2 is left connected to chassis ground.

28) Solder one end of a 22K  $\frac{1}{2}$ -watt resistor to TC2 and connect the other end to B1. Solder one end of a 2.5-mh. r.f. choke to B1 and solder the other end to B5.

29) Solder one end of a 2.5-mh. r.f. choke to J1 and connect the other end to B8. Solder one end of a 0.01 disk ceramic capacitor to B8 and solder the other lead to chassis ground.

30) Solder one end of a 0.01 disk ceramic capacitor to

chassis ground and connect the other lead to TC3. Solder one end of a four-inch length of insulated wire to TC3. Feed the other end up through the  $\frac{1}{2}$ -inch hole near the tube socket and connect it to TPA1.

31) Solder one end of the 1.1-mh. r.f. choke to TPA1 and connect the other end to TPA2. Connect the free end of the 100- $\mu$ mf. mica capacitor that is soldered to CA2A to TPA2.

32) Solder one end of a 13-inch length of No. 24 enameled wire to one lead of a 100-ohm 1-watt carbon resistor. Make the connection close to the body of the resistor. Be sure to scrape the enamel from the end of the wire before soldering.

33) Wind 14 close-spaced turns of the enameled wire on the body of the resistor and solder the end of the wire to the other resistor lead. Cut one resistor lead to  $\frac{3}{4}$  inch long and the other to  $\frac{1}{2}$  inch.

34) Solder the  $\frac{1}{2}$ -inch resistor lead to the ceramic plate cap for the 6BQ6. Solder the other lead of the resistor to the end of a 3 $\frac{1}{2}$ -inch length of insulated wire (see photograph). Connect the other end of the 3 $\frac{1}{2}$ -inch length of wire to TPA2.

35) Cut a piece of tin  $\frac{3}{4}$  inch wide by 1 $\frac{3}{4}$  inches long from a tin can. This will serve as a mounting plate for the 20M11 neutralizing capacitor. See Fig. 2 for details of this plate.

36) Mount the neutralizing capacitor on the plate using the shaft nut to hold the capacitor to the plate.

37) Cut a piece of No. 18 tinned wire 8 $\frac{1}{2}$  inches long and also a piece of spaghetti 7 $\frac{1}{2}$  inches long. Slip the spaghetti on the length of tinned wire.

38) Solder one end of the tinned wire to TP1, which is near the oscillator capacitor. Dress the wire above the chassis top and feed the end through TPA3 so that approximately  $\frac{1}{2}$  inch of wire extends through TPA3.

39) Mount the neutralizing capacitor plate against TPA3 by feeding the end of the tinned wire lead through the small hole in the plate and then bending the lead back around TPA3. Heat the connection and flow solder around the joint to insure a good connection.

40) Take a short piece of No. 18 tinned wire and solder one end to the stator section of the neutralizing capacitor. Connect the other end to TPA2. This completes the amplifier modifications.

The AT-1 shown here was the model that had the rotor of the oscillator capacitor grounded to the panel. The rotor is insulated by enlarging the panel hole and using insulated washers at the rotor mounting. Just above the oscillator tube is the lead from the stator of the oscillator capacitor to the new terminal XC5 on the oscillator coil.

## Output Link Changes

The variable capacitor,  $C_3$  in Fig. 1, can be one of the inexpensive broadcast replacement types.

The maximum capacitance must be more than 300  $\mu\text{f}$ . Because of manufacturers' variations in construction, the method of installation may vary in each case. In the unit described here, a  $\frac{1}{2}$ -inch hole was drilled in the panel  $1\frac{1}{4}$  inches from the top of panel and directly over the amplifier capacitor CA. A small aluminum bracket was made to hold the capacitor in place. The frame of the capacitor was mounted on the bracket with two small screws and the bracket mounted to the panel. The important thing to remember when mounting the capacitor is that the frame or rotor is grounded to the chassis and the stator is insulated from the chassis.

After the capacitor is mounted in place, the amplifier coil assemblies — 80C, 40C, 20C, and 10C — must be removed from their holders. The easiest method of removing them is to unsolder the leads on the 80-meter coil at Terminals 2 and 4 and then 1 and 3, working down in this manner until all coils are removed. The coils are then ready for modification.

41) Unsolder the link ends from Terminals 3 and 4 on 10C and remove the link.

Fig. 2 — Details for making the tin plate for mounting the neutralizing capacitor.

42) Punch a small hole in the coil form between the second and third turns of the amplifier coil counting from the link end and on the same side of the coil form as terminal No. 4.

43) Using No. 24 enameled wire, insert one end of the wire through the new hole, bring the end up to terminal No. 4, and solder. Be sure to scrape the enamel from the end of the wire before soldering.

44) Wind  $2\frac{1}{2}$  turns of the No. 24 enameled wire on the coil form, the first  $1\frac{1}{2}$  turns being interwound with the amplifier coil in the same direction. Insert the end of the wire into the hole just at the end of the amplifier coil, feed the end up to terminal No. 3, and solder. Remount the coil in place but do not connect leads to terminals 1 and 3. Solder the leads from the switch to their original connections on terminals 2 and 4.

45) Unsolder and remove the link from terminals 3 and 4 of 20C. Wind on  $7\frac{1}{2}$  turns of No. 24 enameled wire using the same holes for the new link. Remount the coil, making connections to the switch leads but not terminals 1 and 3.

46) Using the same procedure outlined above, wind a new link on 40C consisting of  $12\frac{1}{2}$  turns of No. 24 enameled wire. Mount the coil back in place.

47) Do the same with 80C, the new link consisting of  $16\frac{1}{2}$  turns of No. 24 enameled wire. Remount.

## PARTS LIST

- 1 470- $\mu\text{f}$ . mica capacitor ( $C_1$ )
- 2 0.01- $\mu\text{f}$ . disk ceramic capacitors ( $C_2, C_3$ )
- 1 19.7- $\mu\text{f}$ . variable capacitor ( $C_N$ ) (Johnson 20M11)
- 1 100- $\mu\text{f}$ . variable capacitor (For stud mounting use Millen 22100, Cardwell PL-6017, or Hammarlund HFA-100-A. If either of the latter two types is used, the spacers must be removed from CO and installed on the new capacitor. For shaft mounting, use Hammarlund MC-100-M or MC100-S, Cardwell PL-6017, Johnson 100R12, or Bud MC1855. If a shaft mounting is used, two  $\frac{1}{2}$ -inch insulated washers with extruded shoulders will be needed for insulating the capacitor from the panel.)
- 1 365- $\mu\text{f}$ . single-section variable capacitor ( $C_3$ ), broadcast replacement type
- 1 100-ohm 1-watt carbon resistor ( $R_2$ )
- 1 22,000-ohm  $\frac{1}{2}$ -watt resistor ( $R_1$ )
- 1 69,000-ohm 1-watt resistor
- 2 2.5-mh. r.f. chokes ( $RFC_1, RFC_2$ )
- 1 6BQ6 tube
- 1 plate cap for 6BQ6
- 5 feet of No. 18 tinned wire
- 25 feet of No. 24 enameled wire
- 1 16-inch length of spaghetti insulation to cover No. 18 wire
- 1 one-lug bakelite tie point
- 1 three-lug bakelite tie point
- 2  $\frac{1}{2}$ -inch insulated washers with extruded shoulders (if needed for mounting the oscillator capacitor)

48) Using a length of No. 18 tinned wire, connect all the No. 3 terminals together and run the wire over to the stator of  $C_3$ , the series capacitor. Solder the end to the stator.

49) Connect all the No. 1 terminals together as originally wired.

50) Remove the lead that formerly connected 10C3 to chassis ground near the tube socket.

This completes the output link changes.

As the transmitter now stands, it can be operated straight through on all bands except 10 meters, where it is necessary to double the final.

## Neutralization

As mentioned earlier, neutralization is necessary to prevent self-oscillation of the amplifier. A 40-watt light bulb connected to the output terminal of the transmitter will serve as a dummy load for testing purposes. Connect the metal screw-base portion of the bulb to the chassis and the base contact to the inner conductor of the coax output socket. Plug a key into the key jack, an 80-meter crystal into the crystal socket, and turn the bandswitch to the 80-meter band. It will be easier to familiarize oneself with neutralization procedure by starting with 80 meters. With the key open, turn the rig on and allow it to warm up for a minute or two. Switch the meter to read grid current and close the key. Tune the oscillator capacitor so that the grid current is about 3 ma. and then switch the meter to read plate current. Tune the amplifier capacitor for minimum plate current and the dummy load should light. It will probably be necessary to adjust the output capacitor for maximum output. Regardless of the setting of the output coupling capacitor, always check the final plate tuning to make sure it is in resonance, as indicated by minimum plate current.

Switch the meter to read grid current and press the key. Remove the crystal from its socket

## The GPR-90 Communications Receiver

**B**E it automobiles or communications receivers, interest always runs high when a new one is announced. Each year the new models are carefully scanned to see if, at last, "they" have built our dream car or dream receiver. But, dreams being what they are and, we hear, so widely diversified, there never will be a dream job that will match up with everyone's reveries. To be practical about it, one should look for the refinements and new ideas that add up to the evolution of this and next year's models.

The GPR-90 will serve as a good example. It is a two-dial receiver and it has double con-

The manufacturers of the receiver are new to the amateur field but not to the receiver-building game, since they have been building radio gear for the government and military for years. This experience is reflected in the GPR-90. There is a clean and refreshing look about the receiver and a quality about the finishes and wiring that one recognizes as the result of having to satisfy government inspectors and quality-control departments. The receiver looks as though it might stand some rough handling.

Electrically, you can get a fair idea in a hurry from the block diagram in Fig. 1. Hey! How

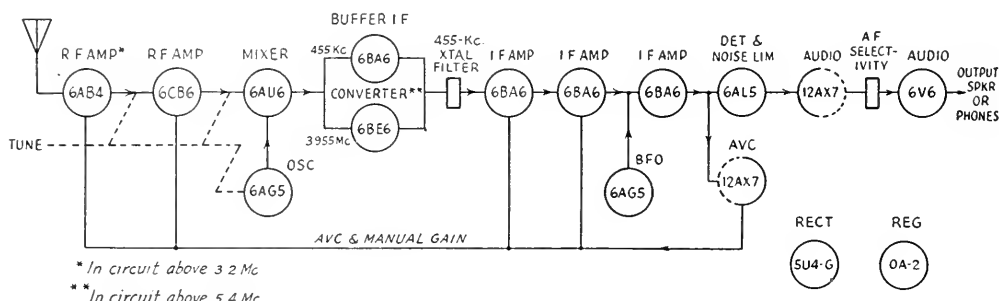

Fig. 1 — Block diagram of the GPR-90 communications receiver. Output impedance levels of 4, 8, 16 and 600 ohms are included.

version (above 3.2 Mc.), and in these two respects it might be considered not unlike a few contemporaries. But there is a lot more to it than that, as we found by digging around in the chassis and the wiring diagram.

about that 6AB4 r.f. amplifier — isn't its input circuit tuned?

The 6AB4 r.f. stage rates at least a separate paragraph. In the circuit, above 3.2 Mc., the grounded-grid 6AB4 amplifier is coupled to the antenna through a ferramic-core broadband transformer that provides two input impedance levels, 75 or 300 ohms. The sim-

Top view of the GPR-90 with the dust cover removed from the variable-capacitor housing.

ranges it is switched into the 6BE6 converter stage. The grid circuit of the 6BE6 has three circuits tuned to 3.995 Mc., and its oscillator circuit is self-controlled. The manufacturer states that no appreciable improvement in stability could be gained by using crystal control at this point. With the 6BE6 converter active, the 6BA6 buffer i.f. is not used.

The crystal filter circuit is similar to that used in most receivers today, and has provision for five degrees of selectivity. The SELECTIVITY switch on the panel is marked in bandwidths at the - 3 db. points, and these range from 200 to

Fig. 2—Simplified schematic diagram of the grounded-grid r.f. stage used above 3.2 Mc.  $R_1$ ,  $C_1$  and  $L_1$  are switched for the various ranges and have different values on the various bands.  $T_1$  is the same on all bands.

2000 cycles. A sixth position on the switch cuts out the crystal filter and gives a 6-kc. bandwidth at  $-3$  db. and an 18-kc. bandwidth at  $-40$  db. The manufacturer's bandwidth curves show the  $-40$  db. bandwidth in the sharpest position to be 5 kc.

Following the crystal filter there are three i.f. stages. The first two are included in the gain-control circuits (cathode control for manual, grid

control for a.v.c.) and the last stage runs at constant gain. The b.f.o. is injected at the grid of the last i.f. stage, and there is also an i.f. take-off at this point for s.s.b. adapters and other accessories. The diode detector and automatic noise limiter (series diode) are conventional, but the use of variable audio selectivity is not. This consists of a parallel-tuned circuit peaked at around 1200 cycles. A variable resistor in series with the inductance allows the operator to change the  $Q$ , and consequently the selectivity of the circuit, from a sharp position that will separate the mark from the space signal of a teletype signal to a broad position that is useful for 'phone reception. The inductor is a toroid.

The receiver includes most of the auxiliary outlets found to be useful in present-day receivers: phono input, accessory socket, and even a utility a.c. outlet and a power plug for vibrator or battery operation.

The six tuning ranges of the receiver are 0.54 to 1.4 Mc., 1.4 to 3.3, 3.2 to 5.6, 5.4 to 9.7, 9.4 to 17.8 and 17.3 to 31.5 Mc. The band-set dial has an auxiliary scale that can be used for accurate logging of the settings necessary for ham-band operation or anything else, and for wide-range use following a 6- or 2-meter converter it was noted that it requires four knob rotations to cover 14.0 to 17.8 Mc. There are locks for both dials. Dial mechanisms are always interesting, we think — in the GPR-90 these consist of rim fric-

tion drive of the celluloid scales, from which a small gear drives a spring-loaded gear on the capacitor shaft. There are heavy flywheels on the knob shafts to furnish inertia for smooth tuning.

On the bandspread side,  $5\frac{3}{4}$  turns are required to cover 3.5 to 4.0 Mc.,  $3\frac{3}{4}$  for the 40-meter band,  $4\frac{1}{2}$  for the 20-meter band,  $2\frac{1}{2}$  for 15, and  $3\frac{1}{2}$  for 10 meters.

Mechanically, there are a few things in the GPR-90 that you don't normally find in communications receivers. One of the photographs shows the tuning capacitors — these are securely tied at two points to the heavy front subpanel and at no other point. An extension at the rear of each capacitor floats in a rubber grommet, and consequently it is difficult for any chassis deformation to be transmitted to the capacitors. We have seen receivers with the tuning capacitors bolted to the chassis that were very sensitive to chassis deformation — apparently the GPR-90 engineers have too. Frequent use of tie points and terminal boards underneath the chassis, and tube locks on the 5U4G and 6V6, reflect the government-specification work mentioned earlier. The components appear to be high quality: A-B type variable resistors, and ceramic insulation and air trimmers throughout the oscillator section are examples.

The GPR-90 is made by the Technical Material Corp., Mamaroneck, N. Y.

— B. G

## The Gonset V.H.F. Linear Power Amplifier

UNTIL the advent of single sideband, the linear amplifier was little known in amateur circles. Among v.h.f. men, particularly, the linear was almost unheard of, but here is a commercial product that seems bound to change all that.

The Gonset V.H.F. Linear Power Amplifier is designed as a matching unit for the popular Communicator, and it is available for either 50

or 144 Mc. When driven by the Communicator, or any amplitude-modulated rig of 3 to 6 watts output, the linear amplifier provides a power step-up of about 10 db., and it requires no additional accessories of any kind. It contains its own send-receive relay, so that the receiver of the Communicator can be used. Only two cables are required; one between the Communicator output and the amplifier input, and the other between the antenna relay and the receiver. These are furnished with the unit.

The Gonset V.H.F. Linear Power Amplifier, shown here with its companion unit, the Communicator, as a driver, is available for either 50 or 144 Mc.

The Gonset v.h.f. amplifier uses a pair of 826s, and has its own built-in high-voltage and bias supplies. Power output is about 50 watts, on voice, when drive is supplied by the Communicator or a similar modulated rig of 3 to 6 watts output.

The amplifier uses two 826s in push-pull. Plate voltage, between 1050 to 1100 under normal load, is supplied by a pair of 5U4GB rectifiers in series. Grid bias is obtained from a selenium rectifier. The send-receive relay is connected in the negative high-voltage lead, and is adjusted to close when the plate current of the 826s is 100 ma. or more. In addition to switching the antenna, the relay also shorts out a section of bias supply bleeder, decreasing the effective operating bias when the amplifier is being driven. Closing of the relay at about 100 ma. plate current means that a minimum of about 3 watts

of drive is required to operate the amplifier.

A meter jack is provided in the center tap of the 826 filaments, but a meter is not required for normal tuning or operation. A tuning lamp is coupled to the transmitter output, and the user merely tunes the various controls for the highest brilliance in the lamp that will allow upward modulation. This will be about 40 to 50 watts output, with the drive that is obtainable from the Communicator. If the amplifier is to be used for c.w. or f.m. service, it is merely adjusted for maximum tuning lamp brilliance as modulation capability is then of no importance.

The operator should also take note of the plate color of the 826s, and this is observed readily through a panel window. A tendency to run hotter than the normal cherry red is an indication of excessive grid drive. A 300-ma. meter should be plugged into the center-tap jack, and the drive adjusted until no more than about 225 ma. is indicated, corresponding to a driving power of about 6 watts.

*Safety note:* As soon as the operating switch is turned on, plate voltage is applied to the 826s. This makes operation of the unit outside the cabinet extremely dangerous, as the tubes themselves show no indication of plate voltage until drive is applied. There should be no occasion for operation of the amplifier with the cover removed. Neutralization, the only adjustment that is likely ever to be required, is accomplished through the bottom of the case, and no high-voltage circuits are exposed with the back cover removed. If you must look at "the works" be sure that the a.c. cord is removed from the outlet, and then short the plate coil to ground with an insulated screwdriver before touching any of the circuits.

— E. P. T.

Bottom view of the Gonset amplifier, 144-Mc. model. Grid and plate circuits may be seen at the left, top and bottom, respectively, of the tube sockets. Power-supply components are at the lower right, with the send-receive relay in the upper right corner.

# Hints and Kinks

## For the Experimenter

### WINDSHIELD-WIPER MOTOR FOR TUNING WHIP LOADING COILS

AN electric windshield-wiper motor, mounted adjacent to the base of a mobile whip, provides a convenient and inexpensive means of tuning a roller-type base loading coil. It is very easy to arrange for reverse rotation of the motor because the field winding is brought out to a switch. Wiper motors can usually be obtained from an auto junk yard for a dollar or two.

— Johnny Johnson, W2ZYX

### MOBILE ANTENNA MOUNTS FOR 144 MC.

THE antenna mounting bracket shown in Fig. 1 is made from a piece of 0.064-inch aluminum strip. It permits vertical mounting of a quarter-wave 144-Mc. whip and can be easily fastened to the rain trough, above a car door, by self-tapping screws.

The  $\frac{7}{8}$ -inch mounting hole at the top of the bracket will accommodate the base of a Master Mobile 2-meter whip. On the other hand, the bracket may be fitted with a Type S8-1J coax

Fig. 1 — This simple homemade bracket mounts on the rain trough of a car and supports a 144-Mc. vertical whip.

adapter so that a homemade whip, based with a Type S8-1SP connector, can be quickly fastened to the assembly.

Fig. 2 shows a more complex but more efficient antenna mount. The base for the assembly, a rubber suction cup such as is used with car-top carriers, is fitted with a brass adapter (homemade) that mates with a Type S8-1T coax "Tee" adapter. The suction cup and the brass insert are fastened together with a flat-head machine screw. The head of the screw is covered with a fiber washer to prevent contact between the screw and the inner conductor of the Tee adapter. If the

inner conductor of the Tee is drilled out at the bottom end, it will not be necessary to use the fiber washer.

R.f. power is fed to the center tap of the Tee adapter via a length of RG-58/U cable, a Type

Fig. 2 — A simple but efficient method of mounting a 144-Mc. whip at the center of a car roof.

S8-1P plug and a Type S8-1J "straight" adapter. The 19-inch whip, equipped with a S8-1SP connector, mates with the top end of the Tee adapter.

Both of the installations are neat in appearance, can be easily mounted on the car, and permit rapid removal of the antenna. When mounting the system shown in Fig. 2, it is advisable to apply a thin film of glycerine to the inside of the cup before the latter is fastened to the roof of the car.

Incidentally, a gain in signal strength is evident when changing over from the rain trough to the roof-center mounted antenna.

— Gerald Bagdy, W2JUL

### OSCILLATOR MODIFICATION FOR THE "GLOBE SCOUT" TRANSMITTER

THE 6V6 oscillator tube in the W.R.L. "Globe Scout" transmitter requires more drive than some of the small VFO units will deliver. This condition can be quickly remedied by changing the oscillator tube to a 6AG7, as suggested to me by W1DJC. The oscillator tube socket must be rewired to accommodate the new tube, but it is not necessary to alter the basic circuit.

After the modification, the transmitter can be driven by a small VFO such as the Heathkit VF-1, and will work as well with crystal control as it did before.

— R. A. Laune, W1CDD

## 600-1200-VOLT POWER SUPPLY COMBINATION

WHILE building the "Final Rig" (that's the one that you think will be the last rig you'll ever build since it's going to have everything in

1200 volts at 250 ma. for the final r.f. section. Ordinary 807s won't take that sort of power so I used a pair of 4-65As. These tubes draw practically the same plate current over a wide range of plate voltages — ratings being 150 ma. each through the 600-1500-volt range. Screen voltage comes from the 250-volt supply used for the exciter and speech-amplifier sections.

— Howard J. Hanson, W7MRX

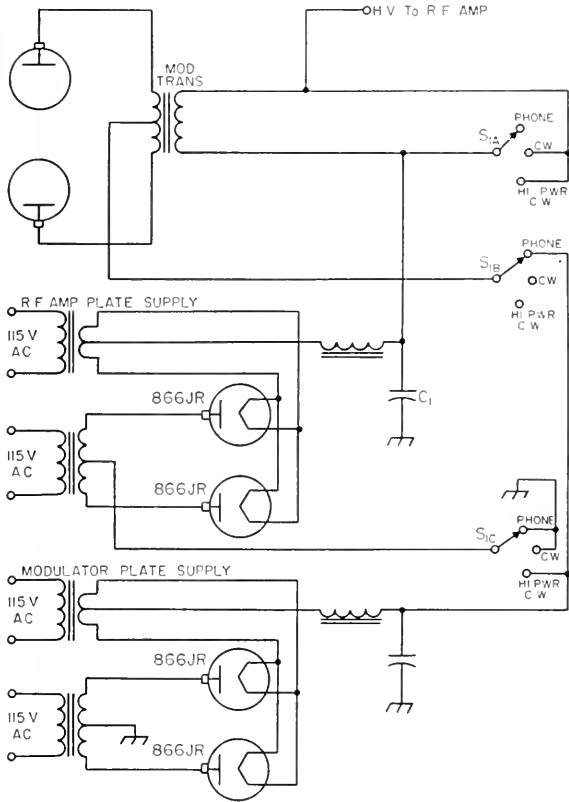

Fig. 3 — Circuit diagram of the 600-1200-volt power supply.  $C_1$  should be rated at 1500 volts or more.  $S_1$  is a 3-pole 3-position ceramic rotary switch. Power transformer ratings are discussed in the text.

it), I came up with the following gimmick which may be of interest to some rig builders.

Originally I planned to put a pair of 807s or equivalent tubes in the final, and so provided a 600-volt 250-ma. power supply for them. I also planned to use a pair of the same tubes as modulators, and provided a separate 600-volt 250-ma. power supply for them. After both power supplies were installed on the chassis and working, I considered the fact that half of my available d.c. power was unused on c.w. A little thought evolved the circuit shown in Fig. 3.

Basically, the control is a 3-pole 3-position switch. In the 'phone position it runs the r.f. section from one 600-volt supply, and the modulator from the other. In the c.w. position it removes plate power from the modulators and shorts out the secondary of the modulation transformer. In the third position, called hi-power c.w., it places the two 600-volt supplies in series, giving

## A TRANSISTORIZED OSCILLATOR FOR 3.5 MC.

HAMS have found many applications for junction transistors, even though many previous types have been limited to audio and intermediate frequencies. The most recent transistor is Raytheon's type 2N112 (formerly known as CK760). It has a cut-off at 5 Mc. and easily oscillates at 3.5 Mc. and above with only a 1.5-volt source of power.

The schematic in Fig. 4 is that of a simple oscillator useful at 3.5 Mc. and its harmonics. With a crystal inserted into the socket,  $C_1$  tunes broadly to the desired frequency. For VFO output, remove the crystal and insert a dummy crystal holder with its terminals shorted. Then  $C_1$  tunes the band with sufficient overlap at each end. The tone is T9 and remains steady as a rock after a minute or two drift.

Fig. 4 — Circuit diagram of the transistorized oscillator.  $L_1$  is the plate winding of a broadcast-oscillator coil (Meissner 14-1058 or equivalent).

This circuit may be used as a signal generator for ham frequencies, calibration purposes or as an external b.f.o. for a short-wave receiver having no beat oscillator of its own. Simply tune the transistor circuit approximately to that of a c.w. signal. This creates a beat with the incoming signal. No need to alter the receiver.

The oscillator uses less than 0.5 ma. at 1.5 volts, but it can be driven safely with up to 6 volts.

— Nathaniel Queen, W2CPA

## ANOTHER SOURCE OF COIL FORMS

TWO TYPES of vials, used by druggists for packaging pills, make excellent coil forms of the inexpensive variety. Complete with plastic caps that may be used as mounting feet, the vials

come in two convenient sizes. One has a diameter of slightly less than  $\frac{7}{8}$  inch and the other is an even  $1\frac{1}{6}$  inches in diameter. Both types provide a winding length of  $1\frac{1}{2}$  inches. If a plug-in assembly is required, either form may be mounted on an old tube base or an octal plug. The caps can be pierced by a pin, scribe or other pointed object. A drill held by a pair of pliers may be used for drilling holes in the forms.

The vials are manufactured by Lerner of Garwood, N. J. My local drug store retails them at two for a nickel.

— Frank Heinfing, W2KKL

## RTTY REGULATOR CIRCUIT

IN the process of building an RTTY converter, I ran into trouble regulating the 60 ma. for the printer coils. The problem was solved by using the circuit shown in Fig. 5.

Fig. 5 — Circuit diagram of the RTTY regulator circuit.  $R_1$  should have a linear taper.

In operation, the parallel 6SN7GT acts as a voltage regulator for the screen of the 6L6, holding the screen voltage to very close limits regardless of screen current. Under these conditions, the plate-current vs. plate-voltage curve of all beam power tubes comes into effect, thus holding the current in the plate circuit to the value selected by adjustment of the 0.5-megohm potentiometer. In practice, I found that the addition to the circuit of two more printing coils (1500 ohms each) plus 700 ohms of line dropped the printer current not more than 2 ma. The arrangement helped to straighten out the inductive lag in the build-up of the 60 ma. It almost completely removes the mark bias previously present.

The circuit works directly into the printer coil without using the polar relay. I did this because the only polar relay on hand was bad and couldn't be quieted down. However, after using this for keying, I will never use another polar relay. No filtering whatever is necessary, and there is just that much less equipment to give trouble. The polar relay was never intended to be used for RTTY or short-haul work in the first place. Its intended use is on long lines where the excessive capacity results in a delay in the mark without a corresponding delay in space. The polar normally works into a circuit where the line furnishes 25 ma. plus for mark and 25 ma. minus for space. Thus any delay or other distortion on mark will

be matched by a corresponding distortion on space, which can be compensated for in the adjustments in the relay. All this is unnecessary for RTTY or short-haul work.

Notice that the power supply used with Fig. 5 is connected with the plus side grounded (for safety reasons) and that it also furnishes voltage for the d.c. amplifier.

— Eugene Austin, W0LZL

## RE THE THREE-WAY SWITCH FOR THE SIMPLEST MODULATOR

SOME time ago, one of my students installed a circuit similar to the one shown on page 36, *QST* for March, 1955. In doing so, the original cathode-to-ground lead, a short length of stout wire, was replaced by a pair of long leads running to and from the switch. His rig was thereby rendered inoperative because of instability. The problem was solved by connecting a 0.001- $\mu$ f. disk ceramic directly between the cathode terminal of the tube socket and ground. A simple point to be sure, but one that may easily be overlooked by inexperienced amateurs.

— John Dodge, W2MTQ

## HOMEMADE NEUTRALIZING CAPACITOR

A HOMEMADE neutralizing capacitor that has some advantages over commercially-made units is shown in Fig. 6. The method of construction permits bringing one terminal of the capacitor directly through a chassis, thus eliminating the extra feed-through insulator ordinarily required. The capacitor requires a minimum of

Fig. 6 — Drawing of the homemade neutralizing capacitor used by W1SIZ/6.

chassis area for mounting, and can be made to any desired maximum capacitance commensurate with high-voltage spacing requirements.

Capacitors of this type may be tailor-made for the popular capacitive neutralizing systems such as those described in Chapter Six of *The Radio Amateur's Handbook*.

— Thomas F. Snyder, W1SIZ/6

## MORE OUTPUT FROM THE HT-18

THE following may be of interest to those who use an HT-18 as an exciter. I have been able to boost the drive to an 813 by substituting a Type 6AK6 for the 6BA6 originally used in the VFO circuit. No change in the socket wiring is required. Also, the VR-105 voltage regulator has

(Continued on page 150)

# Happenings of the Month

## CONELRAD FOR AMATEURS

As previously reported in *QST* (p. 9, April, 1953; p. 46, August, 1954) the Federal Communications Commission has been in process of bringing the amateur radio service under a radio security system called "Conelrad" (for CONtrol of ELEctromagnetic RADiation). Its purpose is to shut down amateur radio stations — except RACES stations — in the event of enemy attack, so that no navigational aid may be available to enemy aircraft. The system has already been put into effect in many other radio services. On August 31st FCC issued proposed rule-making to add the amateur service, the text of which appears below. Any comment must be filed by October 3rd.

As an inspection of the text will show, amateurs will be required to have some means of knowing whether a radio alert is in process. Since a principal means of dissemination of the alert is by standard broadcast stations (as well as FM and TV), monitoring a near-by b.c. station either aurally or with a simple visual indicator will undoubtedly be the simplest solution. *QST* will carry information on appropriate methods in future issues; see also p. 17, September, 1953.

### Before the FEDERAL COMMUNICATIONS COMMISSION Washington 25, D.C.

In the Matter of

Amendment to Part 12 of the  
Commission's Rules and Regulations } Docket No. 1148S  
to Effectuate the Commission's  
CONELRAD Plan for the Amateur  
Radio Service }

#### NOTICE OF PROPOSED RULE MAKING

1. The Commission has before it the approved CONELRAD Plan for the Amateur Radio Service. This plan was developed in coöperation with licensees, amateur radio organizations, the Department of Defense and the Office of Defense Mobilization. In order to put this plan into effect it is necessary to modify Part 12 of the Commission's Rules and Regulations as set forth in the attached Appendix.

2. These proposed amendments are promulgated by authority of Sections 303(r) and 606(e) of the Communications Act of 1934 as amended and Executive Order No. 10312 signed by the President December 10, 1951.

3. Any interested party who is of the opinion that the proposed amendment should not be adopted or should not be adopted in the form set forth herein may file on or before October 3, 1955, a written statement or brief setting forth his comments. Comments in support of the proposed amendment may also be filed on or before the same date. Comments or briefs in reply to the original comments may be filed within one week from the last day for filing said original comments or briefs. No additional comments may be filed unless (1) specifically requested by the Commission, or (2) good cause for the filing of such additional comments is established. The Commission will consider all such comments that are submitted before taking action in this matter, and, if any comments appear to warrant the holding of a hearing or oral argument, a notice of the time and place of such hearing or oral argument will be given.

4. In accordance with the provisions of Section 1.764 of the Commission's Rules and Regulations, an original and 14 copies of all statements, briefs, or comments shall be furnished the Commission.

FEDERAL COMMUNICATIONS COMMISSION  
MARY JANE MORRIS  
Secretary

Adopted: August 31, 1955

## APPENDIX

It is proposed to amend Part 12 of the Commission's Rules by adding the following new Sections:

### CONELRAD

12.190 *Scope and Objective of CONELRAD.* CONTROL of Electromagnetic RADIATION applies to all radio stations in the Amateur Radio Service and is for the purpose of providing for the alerting and operation of radio stations in this service during periods of air attack or imminent threat thereof. The objective is to minimize the navigational aid that may be obtained by an enemy from the electromagnetic radiations emanating from radio stations in the Amateur Radio Service while simultaneously providing for a continued service under controlled conditions when such operation is essential to the public welfare.

12.191 *The CONELRAD RADIO ALERT* is the term applied to the Military Warning that an air attack is probable or imminent and which automatically orders the immediate implementation of CONELRAD procedures for all radio stations. The CONELRAD RADIO ALERT is distinct from the military or Civil Air Defense Warnings YELLOW or RED, but may be coincidental with such warnings.

12.192 *Reception of RADIO ALERT.* (a) The licensee of a station in the Amateur Radio Service is required to provide a means for reception of the CONELRAD RADIO ALERT or a means for the determination that such ALERT is in force.

(b) All operators of stations in the Amateur Radio Service will be responsible for the reception of the CONELRAD RADIO ALERT or indication that such ALERT is in force by:

- (1) reception of a CONELRAD RADIO ALERT MESSAGE which will be broadcast by each standard, FM and TV broadcast station on its regular assigned frequency before they leave the air; or
- (2) reception of standard broadcast stations operating under CONELRAD requirements during the period of the ALERT on 640 or 1240 kc; or
- (3) determining that an ALERT is in force by lack of normal broadcast station operation (observations made before amateur station operation is begun and at least once every ten minutes during operation thereafter will be considered as sufficient for compliance with this Section); or
- (4) other means if so authorized by the Federal Communications Commission.

12.193 *Operation During an ALERT.* During a CONELRAD RADIO ALERT the operation of all amateur radio stations, except stations in the Radio Amateur Civil Emergency Service (RACES) and stations specifically authorized otherwise, will be immediately discontinued until the RADIO ALL CLEAR is issued. Stations in the RACES and such others as are specifically authorized to operate during the ALERT will conduct operation under the following restrictions.

- (a) No transmission shall be made unless it is of extreme emergency affecting the national safety or the safety of life and property.
- (b) Transmissions shall be as short as possible.
- (c) No station identification shall be given, either by transmission of call letters or by announcement.

(Continued on page 148)

## AMATEUR'S CODE

Editor, *QST*:

Paul M. Segal's Amateur's Code is worth-while. Here's another way of putting it:

Amiable  
Moderate  
Alert  
True to ARRL (high fidelity)  
Energetic  
Useful for self, church, community, country  
Refined — pure in taste, mind and morals.

— Rev. M. Finnegan

P. O. Box 26  
Chauvin, La.

## SAYING IT WITH WORDS

7528 Tripp St.  
Skokie, Ill.

Editor, *QST*:

Aren't you guys getting a little stuffy in that rarified West Hartford atmosphere? While I agree with your Q-R-Mary editorial in the August issue of *QST* on the abuse of phonetics, I'm out of phase with you when you criticize the use of Q signals in 'phone conversation.

Every profession, racket, sport or hobby has its own lingo, including Hamdom. Verbal use of the Q code is no more reprehensible than a doctor referring to an "OB" case; a policeman mentioning a "B of I" record; or a soldier talking about his "ID" card.

What's wrong with a 'phone man saying: "Sorry, buddy, but the QRM got you that time. If you can QSY up a kaycee or two, maybe we can continue this QSO. If I don't hear you again, don't forget that QSL. My QTH is okay in the callbook." What's so bad about that?

Assuming the other guy has been a ham for at least a week, I'm sure he would know what I was talking about. And if he didn't, he'd look up those Q signals in a hurry. How would he ever use them on c.w. if he didn't know what they mean on 'phone?

If you're really serious about this, you'd better start revising your own *Handbook*. The terms BCI, TVI, VFO, r.f., i.f., and so on, are used rather profusely. To quote your own editorial: "Say it with words."

— Spencer Allen, W9JGL

P. O. Box 188  
Chester, Vt.

Editor, *QST*:

... I think that misuse and excessive use of phonetics in the 'phone bands may be due to several factors.

Most of us began as SWLs, and when we got our tickets we fell into the habits of those we listened to. Once we were on the air we tended to perpetuate the habits because those with whom we talked had themselves been "trained" and in turn passed along their methods of operating, which we aped.

Most important is the tendency of any group of persons engaged in a specialized operation to develop a "lingo" of "trade talk" for intercommunication. But whereas such specialized speech often serves continuing needs in trades, in ham radio time-saving c.w. abbreviations have been adopted by 'phone men as a sort of badge of the amateur. In using phonetics they feel more like their conception of what a ham should sound like; it makes them feel that they now belong to the fraternity. This tendency can be heard by listening to those hams newly bitten by the "traffic bug" who phonetize all over the place and adopt a clipped, terse, snappy delivery in imitation of what they believe to be the "best" communications style. These hams, in turn,

are heard by SWLs who, admiring the "professional" technique, become conditioned and thus perpetuate the system when they become hams.

In this manner the cycle continues. At worst, excessive phonetics annoy those who abhor wasted time and inefficiency. At best, they satisfy those using them that they are "real" hams.

The least that all of us can do in any contact is to size up the situation quickly at the beginning, use phonetics where confusion might arise, and speak normally and distinctly throughout the contact. . . .

— Jerome S. Miller, W8IDP/1

1130 Martin  
San Jose, Calif.

Editor, *QST*:

So you do not go for "Queen-Roger-Mary", etc. Don't blame you. My pet peeve is the guy that says "hi hi" and then laughs out loud! It really sounds silly.

— Robert F. Davis, W6HAN

## SHADES OF THE WOUFF HONG

P. O. Box 59  
Beverly Hills, Calif.

Editor, *QST*:

In the August issue of the *American Heritage* there is an article on the early days of radio as told by several of the men who were in at the beginning, including former President Hoover who, as Secretary of Commerce, had much to do with formulating the laws and regulations governing communications.

I quote the following from this article:

"The small boys in radio were a constant interest to me. Having their own wave band they had established an association of radio amateurs with whom we dealt constantly.

"One day I asked them how they were going to deal with enforcing the assignments of their wave band to prevent interference.

"The president of the association said, 'Well, I don't think you'd like to know what we do.'

"'Oh, yes,' I said, 'I would.'

"He said, 'Well, we just take the fellow out and beat him up.'"

The mystery of the Wouff Hong finally solved!

— John I. Wright, W6JPA

## 25 YEARS OF ENJOYMENT

D.O.T. Radio Range  
Graham, Ont.

Editor, *QST*:

I am a Full Member of the American Radio Relay League having had my first subscription to *QST* about 1930. Thank you for all the enjoyment that I have received from your magazine in the past, and for what the ARRL stands for. I doubt very much whether we would have been able to enjoy the finest of hobbies throughout the years had it not been for the loyal stand for the amateur's best interests which the League has always taken.

— G. E. Taylor, VE8BNJ

## MORE ON SYMBOLS

67 Broad St.  
New York 4, N. Y.

Editor, *QST*:

The several letters published in *QST* regarding the new standard graphical symbols are most encouraging for

although they object to a change they find little fault with the symbols themselves.

It is curiously human that while we all insist on being proponents of progress, we view with great suspicion any new proposal that will make us act or think differently than in the past. We are all too willing to declare such proposals to be the act of some hidden despot for certainly it cannot be progress if we must change. Fortunately, time heals all wounds, even those inflicted by standardization.

Ever since the first cave man selected those stones that fitted most comfortably into his hand and consequently made the best weapons, we have had standards. His hand became a rough "go - no go" gauge. Since then, standards, both written and unwritten, have provided us with simple routine answers to questions that are met frequently. They are, in effect, a set of habits that we purposely set about to learn because we know we will benefit from them.

The whole structure of amateur radio is based on standards, some of which are purely legal but most of which are arbitrary. The frequency bands in which we operate, types of emission, maximum power, the telegraph code, abbreviations and Q signals, operating procedures, and a host of other everyday things are carefully planned standards, seldom of the amateurs' making and changed as time and conditions dictate. . . .

— Harold P. Westman

903 Derrer Road  
Columbus 4, Ohio

Editor, *QST*:

. . . MIL-STD-122 obligates those of us who earn our dough in making electronic equipment for the services to use the new and "distasteful" symbols. Most of us don't draw enough schematics as hams in this era of store-bought equipment to become rapidly accustomed to any change. I personally allowed myself one frightful grimace and then got busy getting used to them. I don't believe the majority of guys would seriously want to stick with the old symbols if they knew that the commercial designers are switching over. How do the "die-hards" propose to convert to ham use the dandy BC-1099785 they'll buy surplus in 1960 if it's diagram is expressed in symbols used only by the commercials? . . .

— Charles C. Miller, W8JSU

## A KIND OF PLAGUE

504 N. Michigan  
Glendora, Calif.

Editor, *QST*:

Not long ago I became aware of a special type of operating that couldn't be blamed entirely on lid operators. After much research into the matter I found that this person was a sufferer of that dreaded disease, Vacume Cranium Callites, which is especially contagious to new operators.

I have mentioned below some of the easily recognizable symptoms and simple cures.

The symptoms are:

- 1) Spasmodic sending often bearing a resemblance to CQ.
- 2) A jumble of dits and dahs (his call) interspersed once every 1½ to 2 minutes.
- 3) A break for listening every 5 to 7 minutes at which time the sufferer of this terrible malady sometimes musters the strength to tune 2 kc. each side of wherever his receiver happens to be set.
- 4) If he does happen to hook up he never sends each call less than 5 times at the beginning and end of each transmission.

Cure:

- 1) Sending in step with an ARRL practice tape.
- 2) Get a free copy of *Operating an Amateur Radio Station* from the ARRL.
- 3) Examine your operating practice.
- 4) Use your head.

— John McHann, KN6KNF

## DX-CURED HAM

APO 102  
San Francisco, Calif.

Editor, *QST*:

Greetings from Korea, "the land of the morning calm." In my visit to this lonely far eastern peninsula I have dis-

covered a cure for the despised DX hog which, I believe, surpasses even the wrath of the Old Man or the fearsome Rettytsnitch.

The picture: The QTH here is within shouting distance of such prefixes as VS1, 2, 4, and 6, VKs, KL7s, KAs, KRrs, JAs, VU2, AC4, and Europeans and South Americans by the dozens along with many others. Most of these are heard regularly on 20- and 40-meter 'phone and c.w. with S9-plus signals and no, repeat no, QRM from W stations.

The rig here is a BC-610 with 500 cool watts, and the receivers are a pair of Collins 51Js. Antennas are your choice of doublets cut to frequency, long wires, or verticals. There are also plenty of high mountains for those who dream of stacked rhombics, etc. The emission is on 'phone, c.w., or RTTY for those guys who like to have a big TFC count. In addition, the entire rig is mobile on a large truck with a 10-kw a.c. generator if you like a change of scenery from time to time.

The qualifications: All you need is a hoggish interest in working DX and a Signal Corps high-speed radio operator's MOS, plus overseas orders for Korea. The orders are all too easy to get, hi.

The catch: Amateur radio operation with the Army equipment I just described is strictly illegal in Korea. So all you can do night after long, long night is just sit and listen while the rare DX booms in. (Unless you want to take a good chance of losing your rank, ham ticket, and about 10 years of your freedom by turning pirate.) They have monitor stations over here, too.

The cure: After 16 months of just listening like this and tearing your hair out you will become either: (1) a reformed man and honest DX chaser, (2) a drunken derelict, or (3) a babbling idiot. In my own sad case I already lean dangerously toward this third alternative after only a few months of exposure to this horrible cure. However, if I manage to survive these next crucial months I shall see you on 20-meter c.w. from the good old Stateside QTH. In the meantime, I can only hope that my poor miserable replacement will be the fellow that *QST* has voted as Mr. DX Hog of 1955.

— Ken Stewart, W4SMK

## BOOK BANTER

P. O. Box 662  
Nairobi, Kenya

Editor, *QST*:

Some little time ago I came across a copy of your *Radio Amateur's Handbook*—it was being used as a building block by a very young acquaintance. I rescued this somewhat tattered copy and at once realized that it was a masterpiece of ingenuity, organization and clarity. Being somewhat of an enthusiast at that time it became a sort of bible of radio to me. I can honestly say that I learned more from your book than from a collection of others costing some 30 pounds or so.

I have today, at great inconvenience, managed to secure your latest copy, an absolute gold mine, for 40 shillings. It seems to me that with the general run of such texts the author is at great pains to point out his own magnificent intelligence and learning. Teaching seems to be of secondary importance in spite of five or six pages in the introduction enlivened with persuasion to the contrary.

Why is it that American texts, I find, are so clear and concise, with an invaluable knack of guiding the seeker after knowledge painlessly on through the pitfalls of learning.

However, I have now donated the old copy to my African assistant who also aspires to be a radioman. The new copy could not be torn from me with wild horses.

. . . I wish you all the strength in the world and hope you will continue your work for many decades to come.

— N. G. A. Boreham

22 Green Acres Road  
St. Louis 15, Mo.

Editor, *QST*:

During the last few years I have collected and read, cover to cover, most of the League's major publications. The *Handbook*, for instance, is the bible of the amateur and those even mildly interested in amateur radio. But your v.h.f. section has been somewhat ignored in view of the recent swing to the higher bands.

It is my suggestion that the League publish an "ARRL

V.H.F. Handbook" and include in it the many articles that have been written about v.h.f. equipment in the last few years. I started to prepare a representative list of things that could be included, but gave up as it could really get to be monstrous. But sections on v.h.f. propagation, receivers, transmitters and antennae could certainly round out a good publication to say nothing of the advertising you could get from the many makers of v.h.f. equipment.

In short, I'd say that a v.h.f. handbook would be a worth-while addition to the League's fine line of publications.

I would appreciate any comment on my idea although I doubt if it is original with me.

— David Kelce

## AW, SHUCKS

P. O. Box 776

Dunedin, New Zealand

Editor, QST:

I have just read your editorial "Best Sellers" in April QST and it seems to me that you are too modest.

Can you think of any hobby other than ham radio, where that hobby's publication has become the "bible."

Go to any Air Force station, Army or Navy station, government radio station, or any government-owned communications department the world over; and there sits the "bible" known otherwise as the ARRL *Radio Amateur's Handbook*. No wonder you are nearing 3,000,000 copies with such recommendations. . . .

— William L. Shiel, ZL4AK

## LISTENER'S ADVICE

3127 N. 17 Dr.

Phoenix, Arizona

Editor, QST:

Re: SWL Davis' letter in July QST. Mr. David can get a 100% return to his SWL cards if he can perform only one feat — tell the amateurs just *one* good reason why they should waste their time and money! I agree wholeheartedly with VO2AW, having been deluged with SWLs myself. I think we hams should write SWL Davis saying, "I collect money. Please send me some." I wonder how many replies we'd get.

— Robert Fenwick, W7VMQ

P. O. Box 634

Espanola, Ontario

Editor, QST:

The two letters headed "Listener Reports" on p. 142 of the July issue of QST merit thoughtful consideration by all SWLs.

Since going to high power, a VO is deluged with SWL cards — worthless to him.

Meanwhile, an SWL on Guam says he doesn't have too much trouble hearing stations all over the world.

Now a little bit of evidence from me. I run a 30-watt Heathkit, and for the past few months have run an unsuccessful sked with a G. (I have had many W and VE QSOs, naturally.) I would like some evidence that my signal is going somewhere off this continent. In other words, SWL cards would be useful to me. Do I ever get any? Not on your life!

The moral, Mr. SWL, is that if you can "hear him without too much trouble," you won't get a card. Instead, learn code (10 w.p.m. is ample for this kind of thing) and dig down through the QRM and QRN to find the lower-power station who is calling CQ without success. He has a haunting feeling that, despite the tests he has made, and the winking of the neon bulb on the antenna tuner, he is not getting out. He will send you a grateful QSL — International Reply Coupon or not.

So, Mr. Davis, 14.02, Saturdays and Sundays, 1500-2000 GMT, for the first 1 minutes of the hour, if you really would like a VE card.

— F. P. Hughes, VE3DQB

## QSL PERCENTAGE

530 W. 10 St.

Juneau, Alaska

Editor, QST:

I have heard quite a few Ws complaining about DX stations not QSLing 100 per cent so I have made a list of per-

centages of W QSLs received here at KL7AQU. Here it is: W1 — 30%, W2 — 45, W3 — 75, W4 — 4, W5 — 25, W6 — 65, W7 — 60, W8 — 65, W9 — 30, W0 — 90.

This is from 2000 QSOs over a period of 2 years. I wonder how this compares with DX station QSL percentages. What say, Ws?

— Dennis O'Day, KL7AQU

## SKY'S THE LIMIT

Orchard Lane & Ellicott Rd.  
Philadelphia 14, Penna.

Editor, QST:

We have always read with considerable stimulation your extracurricula articles on the aurora borealis, meteor scattering and "Project Moonbeam" to mention a few. For those scientifically and experimentally minded we recommend Prof. Kraus' article on "Radio Telescopes" in the March issue of *Scientific American*. For those who like to build complex arrays, here they can find an array of dipoles 1500 feet long or a parabolic dish reflector 250 feet in diameter if they wish.

The fact that there are many stars emitting tremendous quantities of radio energy should open up a new field for the amateur experimenter, and as for one who feels like Colossus with his 1 kw., let him contemplate one of the objects in the sky called Cygnus A which astronomers estimate radiates in a single second enough radio energy to supply the earth's requirements of heat and power for the next trillion years if converted and translated to heat.

— F. M. Majewski, W3SQK

[EDITOR'S NOTE — Prof. Kraus is the W8JK of beam fame.]

## 22nd ARRL Sweepstakes — 12th-13th and 19th-20th

How many ARRL sections and how many stations in those sections can you work in two week ends? If you are located anywhere in the League's field-organization territory (see page 6), you are cordially invited to take part in this popular annual operating activity. Any amateur bands, 'phone or c.w., may be used. The total operating time allowed each contestant is 40 hours. 'Phone entries are compared only with other 'phone entries — c.w. scores only with other c.w. scores — in your particular section, in the competition for awards. The week-end periods starting Saturday afternoon (1500 PST or 1800 EST) on the 12th and 19th of November mark the open season for SS contacts.

A complete announcement of the contest, including the rules governing participation, will appear in November QST. The rules will be the same as those of the 1954 SS. Amateurs in remote ARRL sections who do not receive the November issue before the Sweepstakes may refer to November, 1954, QST for contest details.

Contest reporting forms will be sent to all amateurs who request them by mail or radiogram. It is not necessary to make advance entry or to use these forms, if the report form prescribed in November 1954 or in the next issue of QST is followed.

BY ELEANOR WILSON,\* W1QON

## YLRL Anniversary Party

The YLRL Sixteenth Anniversary Party is scheduled for Dec. 7th and 8th (phone) and Dec. 14th and 15th (c.w.). The contest will be held on week days this year instead of on week ends as in the past. New rules voted upon since last year's party will be followed. Watch for complete details next issue — but reserve the dates now!

## Field Day

Where were *you* on Field Day? Adding to the statistics and having a fine time doing it? A number of us did just that. There could have been more girls participating though — many more. Let's see what kind of Field Day story we *did* make in '55.

Headquarters YLs W1s YYM, Ellen, Z1B, Ann, and Z1D, Anne, boosted the score of the Laurel Amateur Radio Assn. (W1ICP/1) at Hartland Mt., Granby, Conn. Twelve-year-old WN1CDE, Marsha, was on hand to assist. . . . Working 20 meters under the call K4ACC/4 for her first FD, W4DBP, Jaunita, exclaimed, "Believe me! I will be back in there again next year. Didn't know anyone could have such fun." . . . President of the Elkhart ARC, W9MLE, Peggy, worked 80 and 40 c.w. with her outfit at a site near Bristol, Ind. . . . W9UNL, Lois, says she got in on FD by loaning her half of a generator, along with the OM's half, to the local radio club. . . . Fourteen-year-old K2DSL, Mercedes, con-

New officers of the San Diego YLRL are (l. to r.): President Mary Poe, W6MWU; V. P. Kathy Kreysler, K6AWP; Secy. Isabel McKenney, K6CAL; and Treas. "Billie" MacDonald, K6EOG.

cluded after a stint of operating with the Delaware Valley Radio Assn. that Field Day was so much fun that she wished "it were held every week instead of every year!" . . . OM K6DV reports that K6BGM, Caroline, operated with the Santa Clara County ARA, W6UW/6, atop 4400-ft. Mt. Hamilton, 50 miles south of San Francisco. . . . W9AQB, Norma, recovering from a recent illness, did some logging and made a few calls for the Michigan ARC. . . . W9LOY, Cris, operated 40' phone using one of the North Suburban (Ill.) Radio Club's ten transmitters. . . . The XYLs of the Tri-State Amateur Radio Society, TARS Auxiliary, devoted the week end to keeping their OMs well-nourished. From noon Saturday to finish time Sunday, the girls worked in shifts and served quantities of tasty home-style fare. Auxiliary President Dorothy McGuyer, XYL of W9DGA, remarked: "Besides being glad to help, this event is enjoyed by all. We do make a little profit and use it for entertaining our OMs."

Other YL FDers we've heard about were W1BCU, K4BNG, W5s KQG, WXT, W9s GME, JUJ, SYX, and W1QON. And credit is surely due that scores of loyal XYLs who packed box lunches for their OMs or who actually en-

\*YL Editor, QST. Please send all news notes to W1QON's home address: 318 Fisher St., Walpole, Mass.

Installed as new officers of the Chicago unit of the YLRL are (seated, l. to r.): Vice-Pres. Betty Dorsch, WN9YJC; Pres. Jean Essory, W9RPC; Secy. Betty Sandberg, WN9STR; Treas. Helen Kennedy, WN9MXI. (Standing): Publicity Chairman Grace Ryden, W9GME; Sergeant at Arms Dorothy Galitz; Board Director Eleanor Engbretsen, W9SEZ. Several members have received their tickets as a result of the club's training classes.

camped with their spouses and braved the rigors of cooking in the field alfresco. Reports of the usual W6 activity are missing this year, for an understandable reason. The YLRL's first International Convention was held in Santa Monica June 24th-27th. Plans for the affair had gone too far before the convention committee realized that it coincided with FD. If you were in there pitching and don't see your call in this account, send us the details. We'd like them for future reference.

Starting right now we're going to stump for more YLs working Field Day. From the standpoint of experience and sheer enjoyment, we just can't afford not to take part in Hamdom's most interesting annual activity.

See December QST for the complete tabulation of results and CU next FD for sure!

### New YLRL Net Schedule

Here is the schedule of nets registered with the YLRL for the 1955-56 term, as received from the YLRL Vice-President. Please address inquiries direct to Gloria Matuska, W9YBC, 2322 South Second Ave., North Riverside, Ill.

Freq. (kc)	Day	'Phone Time	NCS

28,900	1st Tues. of month	9:00 P.M. EST	(not announced)

### 1955 AWTAR

For the fourth year the pilots who flew in the 1955 All-Women Transcontinental Air Race had the assistance of amateurs throughout the country. Race information, such as take-off and arrival times, weather conditions, progress reports, etc., was relayed by a network of more than one hundred amateur stations from the start on July 2nd at Long Beach, Calif., to the finish on July 6th at Springfield, Mass. Serving for the third consecutive term, Betty Gillies, W6QPI, was Air Chairman for the Ninth Annual Powder-Puff Derby. Eunice Gordon, W1UKR, headed amateur operations, with Viola Grossman, W2JZX, assisting her. Evelyn Scott, W6NZP, was again in charge of radio operations at Long Beach. Other Radio Chairmen at each stop-over city were as follows:

Blythe, Calif., W6FLD; Phoenix, Ariz., YL Janis Kennedy, W7PWU; Tucson, Ariz., W7LAD; El Paso, Tex., W5KBP and W5IAF; Midland, Tex., W5GGC and W5GOS; Wichita Falls, Tex., YL Garlena Powell, W5QJZ; Tulsa, Okla., W5PA; Springfield, Mo., W6HUI; St. Louis, Mo., W9YWL and W6MSX; Terre Haute, Ind., W9ZHL; Dayton, Ohio, W8FPZ and KL7PIV/WS; Wheeling, W. Va., W5PHY and W8KXD; Reading, Pa., W3PFT.

Others who assisted the various chairmen were W1KUL,

W3BN, W5UUR, W8DWT, W8YFX, W9DLS, W9VZC, W9PUS and YLs W2KEB, K6CPX and W6LMQ. Copy deadline prevents a complete list of participating amateurs in this issue.

Ninety-two participants flew in 54 300-horsepower-or-less aircraft. Flying a Cessna 180, Mrs. Frances Bera of Los Angeles, with her sister Mrs. Edna Bower of Long Beach as copilot, placed first in the handicap. The plane that placed third was piloted by W1YUO, Jerry Gardiner, of Waterford, Connecticut.

Portable or mobile stations operated directly from the airport at each stopover city. Conditions on 75 and 20, the two bands used, were reported very good by W1UKR, who actually lived at the Barnes-Westfield Airport for six days. Operators at Springfield monitored on 20 meters the take-off at three-minute intervals of the planes from Long Beach.

At a post-race banquet, members of The Ninety-Nines, Inc., sponsors of the race, expressed their appreciation to Eunice for the valuable assistance that the amateurs had given to them. The husband of one of the flyers remarked: "I used to have to sweat it out, not knowing where my wife was, nor how she was progressing. Now, thanks to you hams, I can literally follow her every mile of the course."

### Miscellany

Emergency Coördinator W5LGY, Helen Douglas, wonders how many other YLs are ECs too. A provocative query! Drop us a card and let us know if you hold the appointment — and if you don't, why not consider the job? Here's another chance to render amateur radio and your community valuable service.

Yes, she is — a licensed YL, that is. Her call — W5IOZ; her age — ten young years. Paula Bettis of McAlester, Okla., passed her Novice exam last November and received her Conditional Class license in June. A member of the Texas YL Round-up Net, her small voice can be heard on 75 regularly.

The office of secretary-treasurer in the YLRL has been split. W3VLX, Lolly Keller, 3316 Unionville Pike, Hatfield, Penna., is now secretary; W9MMT, Marie Ellis, 531 Cowan St., Ft. Collins, Colo., is Treasurer.

YLRL President W9LOY announces that W4SGD, Katherine Johnson, Box 414, Fuquay Springs, N. C., succeeds W7GLK as YL Century Certificate Custodian. (Complete rules for the YLCC award were in August, 1955, QST.)

WAC/YL Certificate No. 2 has been issued by the YLRL to ZL1BY, William A. Wilson. Certificate No. 1 is held by

(Continued on page 144)

Rosita will never get her own ticket but occasionally she transmits a yelp or two during her mistress' QSOs. In the photo W8HUX is persuading her Mexican chihuahua to display her ability for W8RZN and W8MBL. Marvel, seated, Dorothy, left, and Marie, right, are three well-known Toledo YLs.

## TRANSISTOR TRANSMITTER DX

4815 S.W. Patton Road  
Portland 1, Ore.

Technical Editor, *QST*:

From the standpoint of interest in the use of transistors on the amateur frequencies, I submit the following for whatever value it may have.

Using a transistor and running 1.8 mw. I worked the following stations:

August 22nd — W7DIS, Portland, Ore., approximately 2 miles air line.

August 23rd — WN7AAV, Salem, Ore., approximately 45 miles air line.

August 24th — W7TNF, Astoria, Ore., approximately 85 miles air line.

The transistor transmitter is crystal controlled on 3701 kc. The W7DIS and W7TNF QSOs were arranged, but the WN7AAV QSO was not. The reports were W7DIS, 339; W7TNF, 449; WN7AAV, 369.

On August 25th, contact was made with W7WPR, using the transistor, running 2.5 mw. input. W7WPR is in Seattle, Washington, approximately 200 miles away, and a 459 report was received. He was receiving me on an SX-25 receiver and a folded-dipole antenna.

The transistor used in this circuit is a Motorola type XN-2 PNP junction transistor. It is primarily designed to operate at frequencies around 455 kc., but experiments have shown that it operates very satisfactorily at frequencies in the 80-meter band.

Maximum (absolute) ratings of this transistor are:

Collector volts	minus 10
Collector current	minus 2 ma.
Collector dissipation	20 mw. at 25 degrees C

The transistor transmitter at W7UUZ uses a Motorola type XN-2 PNP transistor.  $L_1$  tunes to 3.5 Mc. with the capacitor fully meshed.  $L_2$  in the tuning indicator is a 6- to 8-turn pick-up loop.

Tuning the transistor transmitter is relatively easy, and the only precaution worth mentioning is that the collector current must not exceed the maximum ratings of the transistor used. To preclude this possibility, the arm of the potentiometer should initially be at the ground end.

The tuning procedure then is first to turn the receiver to the frequency of the crystal used. Apply the collector voltage (make sure that the arm of the potentiometer is turned to the grounded end). Turn the potentiometer up until the milliammeter reads approximately  $1\frac{1}{2}$  ma. Then tune the tank condenser until maximum current is indicated (do not exceed 2 ma.). If it starts to go over 2 ma. return the arm of the potentiometer closer to the ground end (this much will indicate that the circuit is oscillating). Connect the antenna and go through the same procedure, always being careful not to exceed the maximum ratings of the transistor (tests have shown that in c.w. service currents of up to 4 ma. will not harm a transistor of this type).

Because of the small available output I found that it was very difficult to tune the antenna to resonance. Using a few turns of coil with a 1N34 diode and a 0-250 microammeter makes for a very sensitive tuning indicator. Loading of the tuning network with this gimmick will cause the circuit to go off resonance, and when the instrument is removed maximum transfer of the signal to the antenna has dropped off.

— Robert L. Ritz, W7UUZ

October 1930

... Exhorting in "The President's Corner," Hiram Percy Maxim suggests that preparation be made for the upcoming International Radiotelegraph Conference to be held in Madrid in 1932. He urges that the League place a steady supply of amateur radio knowledge into the hands of those who will be delegates to the conference.

... "A Multi-Range Receiver with Four Tuned Circuits" is described by Robert S. Kruse, former *QST* Technical Editor. The unit features single-control tuning.

... Clark C. Rodimon, W1SZ, gives the latest dope on 28-Mc. activity and experimentation with "High-Frequency Notes."

... "Preparing an Article for *QST*," by James J. Lamb, *QST* Technical Editor, enlightens potential *QST* authors by "clueing them in" on just how it's done.

... "The Dynatron Frequency Meter," by George Grammer, W1DF, tells how to build, calibrate and use this modern measuring device. Generalized practical information on frequency-meter design and calibration is also abundantly presented.

... "How Our Signals Look," by Paul E. Griffith, W9DBW, lets the reader in on how a short-wave signal actually appears.

... Operated by Allen D. Gunston, W7GP is the station of the month. Mr. Gunston's rig uses a crystal-controlled transmitter employing two Type '10s, a Type '03A, and a Type '04A in the final. The antenna is a single-wire-fed Hertz and the receiver a remodeled commercial four-tube.

... A detailed discourse entitled "Neutralizing Radio-Frequency Amplifiers" is made by Robert T. Foreman, W9ZZE.

## HAMFEST CALENDAR

**NEW YORK** — The Federation of Long Island Radio Clubs is holding its annual Hamfest on Friday evening, October 14th, 8 o'clock, at the Lost Battalion Hall, 93-29 Queens Blvd., Elmhurst, L. I., N. Y. There will be exhibits, music for dancing, and areas set apart to meet special ham friends you've worked on the air. Tickets purchased in advance, \$2.00; at the door, \$2.50. Contact Robert I. Lippman, 30-51 Hobart St., Woodside 77, New York, for reservations.

**OKLAHOMA** — Another big general Hamfest & Auction on October 23rd at the New YMCA in Tulsa. There will be special entertainment for the ladies and noon dinner will be served on the spot. Total price per person is only \$2.00 advance registration, but \$2.50 at the door. Send all reservations to Norman Smith, W5EYK, 3210 South Cincinnati Ave., Tulsa, Oklahoma.

**WISCONSIN** — The Mancorad Radio Club, Inc., will sponsor the 1955 ARRL Wisconsin Section Meeting at its annual Fall Hamfest, to be held October 29th at the Lincoln Park Field House, Manitowoc, Wisc. Advance registration fee, \$2.00, includes dinner. Late registration fee, \$2.50. There will be an interesting technical program for OMs, and a special program for YLs and XYLs. For additional information, write Howard Hamann, W9RYV, 1340 North 9th St., Manitowoc, Wisc.

## ARE YOU LICENSED?

• When joining the League or renewing your membership, it is important that you show whether you have an amateur license, either station or operator. Please state your call and/or the class of operator license held, that we may verify your classification.

# Annual Simulated Emergency Test

(October 8-9, 1955)

By the time this appears in print, all ECs, SECs, and SCMs will have received a copy of the "SET Bulletin" outlining details and last-minute instructions concerning the ARRL's annual Simulated Emergency Test. This announcement is for the benefit of all amateurs, so that you will know about the imminence of the test and have a general idea how it works and what to do if you wish to take part.

The SET is not a contest. It is the annual test of AREC facilities in conjunction with the principal agencies we serve. Each AREC organization will attempt to better its last year's score, so the scoring system will be the same as in previous years. Here's a brief run-down of how the SET works:

1) The EC calls a surprise alert of his AREC organization sometime during the October 8th-9th week end. If another date is more convenient for local reasons, such an exercise can be counted as the SET exercise. Conduct your drill on the designated week end if you can.

2) The group conducts a simulated emergency test under the EC's direction. The test may be slanted toward natural disaster (with Red Cross participation, if feasible) or enemy attack (in coordination with local civil defense). During the test, each local participant should dispatch a message in standard ARRL form to the EC, indicating his presence and availability, or anything else the EC directs.

3) The EC dispatches a message to ARRL Headquarters briefly describing the test and mentioning calls of participants.

4) At the EC's solicitation, the local Red Cross Disaster Chairman (or other official) dispatches a message to the American National Red Cross in Richmond, Va., via amateur radio, reporting Red Cross participation in the test.

5) Also at the EC's solicitation, the local Civil Defense Director dispatches a message by amateur radio to his State Civil Defense Director reporting civil defense participation in the test, if any. This is a job for the SEC and state or section traffic and emergency nets. A list of state directors is included in the SET Bulletin.

6) The local press is brought into the exercise for the maximum in publicity. ARRL sends out a publicity release, but your best publicity is generated at the local level. Invite the press to your exercise.

7) Some time during the October 8th-9th week end, a Test Emergency Alert (TEA) message will be transmitted on the National Calling and Emergency Frequencies. If you copy the message, send us a radiogram indicating you copied it (giving station from which copied, date, time and frequency), then send us a confirming copy of the complete message (not just the text) by mail, you'll get special QST mention in the SET write-up. Last year the message was sent by WIAW only once on c.w. and once on 'phone. This year we hope to have it sent more often, and by stations in the Midwest and Far West also, if possible. Keep your receiver tuned to one of the National Calling and Emergency Frequencies during the week end and you can't miss it.

8) After the test, the EC reports details on a form provided with the Bulletin. See that yours reports, so your work will receive credit.

WIAW and other stations operated by ARRL staff members will be active to take incoming traffic for ARRL.

Traffic for the Red Cross or state civil defense offices can follow regular routes, most of which are normally activated on Saturdays and will be activated especially on Sundays during the SET. If Amateur Red Cross Stations W6CXO (San Francisco), W9DUA (Springfield, Ill.) and W3PZA (Washington, D. C.) are able to be active, they can take traffic for American National Red Cross. If you cannot clear your hook on the NCE frequencies, try one of these: 3640 or 3880 (for Conn.), 3680 or 3835 (for Va.).

In Canada, Red Cross traffic should be forwarded to Canadian National Red Cross in Toronto, civil defense traffic to Provincial Civil Defense headquarters. Canadian ECs send their SET reports to ARRL, same as all ECs. Designated Canadian National Calling and Emergency Frequencies are 3535, 3765, 7050, 14,060, 14,160 and 28,250 kc.

If you are not already signed up in the AREC, now would be a good time to get lined up with your EC and start your public-service work right by participating in the SET. Why not look into it locally and see what's cooking? We'll tell you the name and address of your EC (if any) if you don't already know it.

See you on October 8th-9th in the SET, O.M.

## A.R.R.L. QSL BUREAU

The function of the ARRL QSL Bureau system is to facilitate delivery to amateurs in the United States, its possessions, and Canada of those QSL cards which arrive from amateur stations in other parts of the world. Its operation is made possible by volunteer managers in each W, K and VE call area. All you have to do is send your QSL manager (see list below) a stamped self-addressed envelope about 4 1/4 by 9 1/2 inches in size, with your name and address in the usual place on the front of the envelope and your call printed in capital letters in the upper left-hand corner.

- W1, K1 — D. W. Waterman, W1HPQ, 99 Flat Rock Rd., Easton, Conn.
- W2, K2 — H. W. Yahnel, W2SN, Lake Ave., Helmetta, N. J.
- W3, K3 — Jesse Bieberman, W3KT, Box 34, Philadelphia 5, Penna.
- W4, K4 — Thomas M. Moss, W4HYW, Box 644, Municipal Airport Branch, Atlanta, Ga.
- W5, K5 — Oren B. Gambill, W5WI, 2514 N. Garrison, Tulsa 6, Okla.
- W6, K6 — Horace R. Greer, W6TI, 414 Fairmount St., Oakland, Calif.
- W7, K7 — Mary Ann Tatro, W7FWR, 513 N. Central, Olympia, Wash.
- W8, K8 — Walter E. Musgrave, W8NGW, 1294 E. 188th St., Cleveland 10, Ohio.
- W9, K9 — John F. Schneider, W9CFT, 311 W. Ross Ave., Wausau, Wis.
- W0, K0 — Alva A. Smith, W0DMA, 238 East Main St., Caledonia, Minn.
- VE1 — L. J. Fader, VE1FQ, 125 Henry St., Halifax, N. S.
- VE2 — Harry J. Mabson, VE2APII, 122 Regent Ave., Beaconsfield West, Que.
- VE3 — Leslie A. Whetham, VE3QE, 32 Sylvia Crescent, Hamilton, Ont.
- VE4 — Len Cuff, VE4LC, 286 Rutland St., St. James, Man.
- VE5 — Fred Ward, VE5OP, 899 Connaught Ave., Moose Jaw, Sask.
- VE6 — W. R. Savage, VE6EO, 329 15th St., North Lethbridge, Alta.
- VE7 — H. R. Hough, VE7HR, 2316 Trent St., Victoria, B. C.
- VE8 — W. L. Geary, VE8AW, Box 534, Whitehorse, Y. T.
- VO — Ernest Ash, VO1A, P. O. Box 8, St. John's, Newfoundland.
- KP4 — E. W. Mayer, KP4KD, Box 1061, San Juan, P. R.
- KH6 — Andy H. Fuchikani, KH6BA, 2543 Namanu Dr., Honolulu, T. H.
- KL7 — Box 73, Douglas, Alaska.
- KZ5 — Gilbert C. Foster, KZ5GF, Box 407, Balboa, C. Z.

# How's DX?

CONDUCTED BY ROD NEWKIRK,\* W9BRD

**'Ow:**

When an unbeliever (stranger to amateur radio) pays a visit to your hamshack, chances are you're more than a little perplexed at the naïve questions put to you. One such BCL-type acquaintance of Jeeves' early Oxford gyp days called on us recently and performed true to this form. After those two well-qualified quidnuncs put the Boss's brandy stock to rout Jeeves brought the chap into our shack. Their disconcertingly discursive conversation took the following course. . . .

*Guest:* Good 'eavens, J.J. — 'ow far do you communicate with this curious apparatus?

*Jeeves:* Boundless, boundlessly far, Reginald. On a still evening we may be detected inside Outer Mongolia, you know.

*Guest:* 'Zooks! And you constructed this gadgetry entirely yourself, J.J.?

*Jeeves:* Not quite, old top. The factory, you know.

*Guest:* Those gaily-lettered pasteboards on the wall, J.J. — some sort of optometrical claptrap, what?

*Jeeves:* Oh, an uncommonly rare collection of long-distance QSLs, Reginald. Uncommonly rare. The Boss conducts a DX column — samples, you know.

*Guest:* I observed no aerial outside, J.J., yet I would imagine one should require an imposing structure to radiate such great distances. Incongruous, what?

*Jeeves:* The neighbors, Reginald — we had one up this morning. Moreover, the Boss is using his underground antennae for Ceylon. Straight down, you know.

*Guest:* Doubtless much power is consumed by this vast thingamabob. Expensive, what?

*Jeeves:* Righto, Reginald, the meter does whirl a bit. But not as furiously as formerly. Jumper, you know.

*Guest:* I once 'eard of a wireless chappie who made quite a nuisance of himself. Downright rum performance — 'arrased local video, the wireless, gramophones and what not. Are you faced with such a lot, J.J.?

*Jeeves:* A ripping amount once, Reginald, but negligible now. Silent hours, you know.

*Guest:* Wires, boxes, switches, valves and more wires! I say, J.J., 'ow do you manage to tidy it up?

*Jeeves:* Elementary, dear Reginald. I shove off into the cellar, open all switches and remove all fuses beforehand. Silent Keys, you know.

*Guest:* I say, J.J. old bean, my brother-in-law's solicitor's nephew in Sussex is a wireless bug. Do you suppose you could chat with 'im and permit me to shout a cheerio back 'ome? Do you really, now?

*Jeeves:* Nothing to it, Reginald. But as you do not know his call sign I shall have to call "CQ Reginald's brother-in-law's solicitor's nephew in Sussex." Beastly cumbersome, you know. . . .

Well, the imperturbable Jeeves had his usual smooth answer for everything but surely he was going overboard on that one. Visitors who have ham acquaintances they want you to contact on the spur of the moment without schedules, call signs or other clews — hah! Just "give Egbert a call and let me say hello to him." A million to one would be comfortable odds.

But would you believe it? After Jeeves completed a short "CQ Reginald's brother-in-law's solicitor's nephew in Sussex," back came a clipped British voice on the frequency saying, "... This is Reginald's brother-in-law's solicitor's nephew, G3ZZZ in Sussex, returning. Thanks for the call, you know." And Reginald, Jeeves and Egbert conversed amiably for the next two hours without batting an eye.

Anyone for the rest of that brandy? (Nerves, you know.)

**What:**

Reginald is back on the road for Schweppes now, and Jeevesie has his head down in the mailbag to see what the gang has to say this month. There are squeals of delight on all sides, we note, as we swing toward Old Sol's aene aene on pox peak. "Just had about 300 Stateside QSOs with signals running to 5 by 5 to 9 plus 40 db., the latter predominating — all around good Stateside QSOs." — *HZLAB* . . . "We've had several days of wonderful long-path propagation lately." — *ZD6BX* . . . "Twenty sure is hoppin' these days (for a change)." — *W2BRV* . . . "Very good night openings to Europe for two to four hours at a time and some nights the band is wide open all night long — guess that's a big improvement over last year at this time." — *W6GFB*. And so it goes!

**20** 'phone is all the rage with pukka DX available in quantity. W9EU successfully directed his 250-watter at CP5EP (189) 14, DU5 1AP (157) 13, 7SV (195) 14, ET2US (187) 2, KG6AFX (209) 13, KT1WX (187) 0, KW6BB (245) 15, KX6BU (225) 14, TF2WAF (158) 3-4, V5ICZ (126) 13, W7VMD, KG6 (199) 13, 4X4s FK (110) 4, SK (140) 3, 5As 1TJ (151) 3, 2TZ (170) 22 and 9S4A1 (117) 1. . . . HI3DL 18, KG1BO 7 and a 5A2 came back to W4TFB. . . . W4GUV busied himself with a DU7, KAs 2AK 2JW 3EB 5HM, KC6CG (241) 10-12, a KG1, KJ6FAA (200) 9-12, KR6QX 12 and others. . . . Saipan's KG6SB (255), VK9H10 (190) and VR2CW were assimilated by W9WHM. . . . WSKAK caught up with EA8BS (150) 22, KG1FR (210) 17, VP2s DA (120) 14-15 and KM (160) 14-15. . . . HBNU/Trieste, VSs 1GT 2CU, VU2EH, XZ2SS and 4S7SW show up on W7AHX's

\* Please mail all reports of DX activity to DX Editor Newkirk at 4128 North Tripp Ave., Chicago 41, Illinois.

list. .... Here and there, W5CAY nipped HH2W; W6NJU hooked VS2CV 23; and W7TML bagged KA2SK 11. .... The Northern and Southern California DX Clubs and West Gulf DX Club have the goods on the 14-Mc. 'phone workability, or imminent workability, of AC5PN, BV1US (250) 15, C3WV (190), CRs 4AL 5SP 7CO (190) 15, DU9VL (171) 10, ET2s AB (150) 4, US (187) 2, XX (144) 5, FO8s AB (118) 6, AK (159) 6, FP8AP (60) 17, FY7YE (152) 5, HC8GI (115) 5, HI6EC (177) 0, KG1AA (252) 4, KH6ABH (255) 5 on French Frigate Shoal, KJ6BG (230) 14, KP6AK (236) 6, KR6AF (129) 13-14, KX6AF (250) 6, LX1JW (191) 23-0, MP4BBV (128) 3, PX1YR (162), SV0WU of Rhodes, TF2WAN (130) 15, VK1s DC ZM (150) 6 of Macquarie, VK9s BG (168) 6-7, DB (175) 15, RM (110) 6, WI (293) 10, VQs 4AQ 4MA (190) 6, VRs 2AP (152) 6, 3C (165) 6, 6AC (142) 4-5, VS1s FS (111) 15, GX (142) 14, GZ (126) 13, VS2DF (107) 16-17, VS6s BE (106) 16, CL (130) 15, CT (172) 16 and no relation to VS4CT-VS5CT, CW (99) 7, VS9s AF AL, VU2ET (196), XZ2KN (179) 15, YJ1DL (118) 7, YK1AE, YO3s GL (157) 22, GM (190) 13, ZB2A (94) 19, ZCAIP (92), ZD4BT (150) 0, ZM6s AP (163) 8, AS (180) 6, AT (167) 5, 3V8AS (164) 5, 4X4s CK (150) 4, FF (150) 4, FQ (150) 4, FV (139) 3, 5A4TX and 9S4BE. .... *Newark News* Radio Club members combed 20-meter 'phone frequencies for CP5s EK EQ/CP6, CR6AF, CS3AC of Azores, CT2AC, DU1s CV VVS, EA8AX (150), EA9s AR AX BC BH, EL9A, FB8BZ, FF8AK (110), FM7s WF WQ, GC6GF, HAI1W, HH7RM/M, HK0AI, HRs 1BG 1KS 1OS 1RL 3HH, HZ1AB, JAs 1AC 1CU 1PW 1TW 3BD 4BB 6CA, JZ0AG, KC6s UZ ZB, KGs 4AP 4AX 6FAA, KM6AX, KR6s JW 00 (140), PT QW USA, KT1s DD WX, KV4s AA AQ BB BI, KW6s BD BJ, KX6BI, LB1DD, LX1DU, LZ1KSP, MP4s BBL BBU KAC QAI QAL, OD5s AB DA, OQ5s BI ER, PI1s J LB, PJ2s AA AG LC, ST2DB, SU1AS, SV8s WM WO WS, TF2WAG, TG9s BR MB, VKs 1PG 9HB 9OK 9RH, VP1s 1VR 2DL 3HAG 5BM 7NG 7NS 7NZ, VQs 2RR 4FK 4RF 5FU, VR2s AE AS, VSs 1EY 2DY 6DA, VU2s CS GM, YIs 2AN 3WW, YO3CM, YSs 1MS 10 2JV, ZC4BA, ZD3BFC, ZE6JI, ZSs 2MI of Marion Isle, 3AN, 3V8s BA BR, 4S7YL, 4X4s CR CX FZ GB, 5As 1TK 2TK and 4TU. In addition a little a.m. prowling by NNRC racked up Yanks-in-Japan KAs 2CW 2HM 2IM 2JW 2NY 2OJ 3RR 4BB 4AQ 7JS 8AB 8SB and 9MS boiling through with that intriguing Asiatic flutter.

20 c.w., to dredge up an old cliché, needs no introduction. San Rafael's W6GPB scored with LZ1KAB (70) 5, SP8KAF (63) 5, SU1REC (90) 21, SV0WS (20) 5, VQ5FS (50) 19, VU2s AL (25) 16, JK (40) 15-16, YI2AM (20) 20, ZD6BX (60) 5, 4S7s AM (30) 16, MH (10) 15-16, NB (55) 16-17, NX (50) 15-16, PT (55) 15-16, 4X4s CK (60) 5 and IE (48) 10. A QSL from VQ8AL, three years late, and an SWL report from Odessan UA4PL were highlights among Joe's postbox items. .... K2BZT battled through to DU7SV (90) 15, HA5AM (22) 21, HB1s in

VQ8AX (13) 22, a VU2 and ZD2, ZS3VC (75 (19, an 15 and 4X4. .... Twenty-eight watts got HA7OL (40) 22, KA300 (62) 12, OX3AY (12) 3, TF6WAK (24) 11, VP2BV/P (85) 22, VQ4RF (90) 20 and YO3GY for W9UKG. Then Doug kicked in the 300-watter and clobbered DJ1UE/YU (!), HA5BL (41) 22, a KJ6, SP5AR (68) 4, ZS91 (41) 21 and 9S4AX (7) 22. UAs 9CM 9DIH 0KAB, UB5s KAA KAB KBE and UG6AB were called in vain. .... W1WAI took on CP5EP (50) 22, JA5AA (70) 12, VP3VN (80) 12, UC2AA (50) 22, a ZD2, ZD3A (40) 22 and 9S4CH (33) 22, celebrating the arrival of his new DXCC diploma. .... IS1CXF (60) 22, KA2SK (32) 11, PJ2AR (85) 1, an SP5 and VP3, YN1PM (8) 23 and ZB1JRK (22) 23 came back to W1OJR. ZB1JRK pulls the big switch quite soon for departure from Malta. W1OJR forsakes DX on clear nights to scan the heavens with a homespun 3-inch reflector 'scope. .... CR8AC (10) 15 got away from K6ENX but FK8AK (10) 5-6, HR1RL (80) 16, KC6AJ (65) 7, TF2WAF (50) 7, VQ2DS (100) 16, VR3B (80) 4-5, VS1GK (70) 15, VS2CV (40) 16, VS6CQ (75) 17, ZP5GM (15) 17 and a 4S7 didn't. Since activating quite recently Otto has accounted for over 100 ARRL DXCC Countries List items in his Los Altos QTH. .... HA5KBZ (50) 23, HK0AI (62) 0, HP1EH (20) 14, a YS1 and ZD6 hit the spot with W8KAK. .... K6EC crept up on CX5CO (46) 0, I1BLF/Trieste (78) 0, SP9KAS (83) 5, VS1GU (91) 15, VS2DW (42) 16 and 4S7GE after late summer QRN drove him off favorite 40. .... K2GRV caught many of those already mentioned as well as EA9AP 23, FP8AP 19, HC1LE and I1BNU/Trieste. Whit is 15 and has 60 countries to show for five months DXing with his Viking, Windom and BC-348J. .... DU1CV (70) 15, UA9KKB (80) 15, VP4JL (20) 5, VS6DD (80) 13, ZM6AS (50) 3-4 and KR6USA (15) 15 worked W6UD. .... W7TML bore down on numerous Europeans, FK8AO 6, KA8SD 5, UA0 and UQ2, Aussie ship X1NP in the Pacific, YUs 1HU 3 and 3KT 6. .... ZD6BX picked up ET3AH (21) 13-14, I5LV 18-19, KJ6KW 15, KR6s LJ 14, MC 16, VK9AU 12, VR2BZ (52) 5-7, VS6s CD CG CO DE 15, ZC2PJ (20) 13-15, ZD2HAH 17 and many other choice catches. .... Quick! peeks at this log and that log, W2BRV: FB8AS, an FD4, MP4BBE. K2GFQ: FK8AE (15) 5, HB1OP/HE, OQ9CZ (45) 1-2, ZD2WAF 17. K2HZR: SV0WS (5) 19, K2JKC: KV4s AA BK, W3UXX: GD3IYS, HH9A, PJ2CT, VPs 5BM on Turks, 6PJ, W4GUV: a Liechtenstein HB1, IT1AGA, JAs 1CR 5AB 6AD, SP6WF 20, VQ6LQ (65) 2-4, ZB1ZM6 984, W4TFB: HH3DL, KA2s KS RB, ZD6, 3VAN (2) 5. WGDXC, SCDCX and NCDXC contribute these tidbits to our 20-c.w. gallimaufry: AC5s PN (8-100) 15, SQ (100) 18, CRs 4AF (26) 21, 9AI (85) 16, 10AN (70) 16, CTs 2BO (68), 3AB (49) 0, 3AN (70) 22, DU2s IOR (33) 12-13, 3DO (90) 12, EA8s BF (93) 1, BP (51) 2-3, FSMA/FB8 (74) 6, FB8BO (95) 12-13, FK8AL (12) 16-17, FO8s AC (94) 6, AG (50) 6-7, AK (95) 7, AM (10) 5, one FUBAZ (75) 22, FW8AB, FY7s YE (60) 1-2, YF (40) 12, HA7s KLA (48) 16, KLZ (35) 13, HE9LAA (64) 22-23, H1SHG (56) 4, HZ1AB (70) 0-1, IT1TAI (70) 22, JZ0AG (85) 13, KC6UZ (41) 13, KM6AX (80) 5, LB5WE (64) 13, LX1JW (43) 19, MP4KAV (9) 0, OD5DA (115) 23, SPs 5CC (110), 9KAB (40) 17, 9KAD (37) 13, one TFF1PJ (10) 4, VK9s RH (70) 7, RM (46) 13, WP (25) 7, VQs IQDN (73) 3-4, 2GW (45) 14-15, 4EO (83) 5, 4FM (64) 0, 5EK (100) 5, VR4AE, VS1s BJ (82) 16, FS (50) 14, GT (32) 15, VS2s DF (57) 13, EM (5) 15, RM (84) 14, VS6s AE (95) 13, AS (47) 14, AJ (100) 12-13, CL (6) 14, CT (88) 17, CW (76) 14, VS9AF, XZ2AD (18-90), YOs 2VM (72) 23, 3RF (58) 5, one ZA1KA (68) 20, ZC4GF (21) 13, ZDs 1PW (110) 13, 4BT (137) 4, 9AC (75), ZS2MI (175), 4S7s LW (58) 16, WP (30) 17 and 9S4BS (60) 23. UAs 3CR (79) 5, 4HI (81) 3, 6KTD (50) 14-15, 9DN (80) 23, 0GF (50) 13, 0GR (55) 13, 0KAB (50) 13, 0KAD (50) 14, 0KOA (46) 13-14, 0KUA (40) 13 and UH8KAA (60) 15 are included among the reserved Russians poking through. PX1EX (raised by K2BZT, Ws 1WAI 4GUV 6GPB 9EU 9UKG and others), XW8AB (52) 14 (reported by K2GMO, Ws 6GPB 7TML, K6ENX), YJ1DL (18) 6 and ZS8L (ZS1PD on DXCURSION) appear in many logs. So does AC0AA who is rumored to be (1) in Korea, (2) en route up Mt. Everest, (3) 'board ship here and there, *ad infinitum*. Now we give the dial a healthy twirl and find ourselves scanning

◆ "How's" normally goes light on portraiture but this gentleman is quite outstanding. He lays claim to possession of the first officially authorized station under new Egyptian amateur regulations — SU1IC. (Photo via W4HYW; W9FDX, MRAC: W9ABA; and W9EU)

Switzerland and Liechtenstein, 15REN (80) 21, LB8ZB (20) 22 just Norway, LX1AO (69) 16, LZ1KSP (77) 23, MP4QAL (90) 18, OY7ML (50) 23 who raised soup from 15 to 75 watts and intends extensive 3.5-Mc. work this season, SPs 3PS (55) 21, 5BR (20) 23, UQ2AN (29) 4, VQ8CB (72) 15, VR2s BP (60) 5, CZ (90) 5, YO3UA (30) 0, ZD2s IDCP (10) 21, NNW (20) 21, 4X4s BT (80), CK (76), DR (77), FK (60), FQ (18), FV (37), GY (80) and II (63), the Israelis worked between 21 and 22 GMT. .... DL4ZC QSOd CR4AL (72) 20-21, one FC7GE 22, OQ5BT 17, VP5DC (75) 0, YS10 23, YV1AI 21, ZD1FB (21) 19-20 and ZP5AY 21-2. .... EA6AM (18) 22, HB1MO in Schwyz canton, KG1AW (103) 23, KJ6s BG (15) 5, FAA (32) 1, KW6BB (30) 14, LB8YB (38) 0 of Greenland, OD5LX (10) 4, MP4JO (40) 3, VQ8AG (15) 4-5, VSs 1GS (49) 12-13, 1GX (42) 13, 6AS (46) 14, VU2s JG (43) and RC (40) 3 responded to W9EU. .... K2GMO did well with FD4BD (24) 22, JA6AA, KC6CG (61) 13, KG6NAB (100) 13, KJ6BG (70) 3, MP4BBL (66) 0, a Qatar MP4, OD5AP (20) 20, ST2NG (86) 22, a UQ2,

15 'phone. European, African and Oceanian openings now are the 21-Mc. fad and W4WMV snapped up VQ4s EO SS, VS1FK, ZB1AJX and 4X4BL with his 30-watter. Friend W4NQM raised a bunch of Europeans including ZB1s AY JRK, as well as CN8MT, ZLs and ZSs. VS2BB and LX SP SU stations were heard. .... Fifty watts and an 80-meter skywire were sufficient to accumulate CE3TH, CXs 2GM 2IY 5AF, CP5EQ/CP6, FM7WQ,

Before terminating his activities at OE13USA, K2IXD (left at table) visited on-the-air acquaintances in Israel. One of the many highlights of his 4X4 tour was a jolly hamfest at 4X4FV where these scenes were photographed. The chief of and host tunes the NC-98 while maintaining a schedule with K2IXD's Salzburg home base via the 4X4FV 40-watter. The station's location, shown at right, is situated in northern Galilee atop one of Israel's highest prominences. Beams and dipoles for all DX bands are plentiful and a new 100-watt rig is under construction.

HH7JL, HK2GO, HR3JH, KG4AV, KV4BJ, PJ2AA, TI2BX, ZP5IT and sundry PY-LU fellers for W4CHK. . . . W4YOK drew forth CE3SQ, CX6BM, HC1FK, HH7W/m, KH6EY/m, KV4BB and PK2AO, also hearing and working the /MM gang all over the place. . . . KA2GS, KH6s KZ5s, PY4YC, VKs 2AFE 3GV, ZLs 1GJ 2AX and ZP5HX returned W6ZZ's compliments. . . . W6UED trapped VP1SD while vacationing from 14 Mc. . . . NNRC reporters tagged 15-meter A3 activity by CN8s FM GO, CP5EK, EA9BS, FY7YE, HC1s EP FS, HP3FL, KG4AN, KL7ZG, MP4BBV, OA3s 3L 4AK, SV0WO, TI2s RC WM, VP5BM, VP6s FR GN GT WR, VP7NK, VO4s AQ EA EU RF, VR2CG, YV5BB, ZD4BO, ZP5JB, 4X4s BL GB and 9S4AD.

**15** c.w. still attracts the more adventurous Novice clientele. WN3ZKH captured F8VK, GW3QN, LU5 3EQ 3EX SEN 8TA, VP9BL and PJ2AR, reaching 21 countries on five continents. Anybody collected a Novice-style WAC yet? WNSBVF worked DL4ZC, HB9MQ, KN4CJO/KV4, KP4s in number, PJ2AV, VP6s 6KL 7NN and TI2EA with his Viking Adventurer. . . . Back to the Generals, K2DSW telegraphed with a big bunch including F8s DA RJ, LX1DZ, OE3SE, SP5AR, VP9BO and ZB1AY. CR6BX and KT1OC are gottaways. . . . W1CTW soaks up Europeans like a blotter now that he's licked his local power leak. Cal also stalks SU1CN, ZSs 7C and 8I via the A1 route. . . . FF8AJ 16-17, LU9DAZ 19-20 and another ZP6CR 19 came back to DL4ZC.

**40** c.w. conjured up LU7ZT 4, VP5DC 4, YU4DOP 4 and nifty ZD9AC 8 for W4TFB. . . . K2HZR mentions OY7ML, UA0KKB, UB51D and other 7-Mc. triumphs. . . . Among K2IKZ's lengthy list of European catches we note UO5KAA, SP7KAN, YU1KF 2BOP 3AJK and 4EPQ. Small wonder he likes his new QTH! . . . K2IGG mentions the availability of CR7CI, FQ8AA, JZ0DN, OX3AY, ZD6BX and ZE3JP on 40. VP8ZTQ and HZ1A were heard in the ? department. . . . W1VSW exchanged RSTs with F8s DA RJ, HB1OP/1IE, HR1JZ, SP5KAF, YU4JF, YV1AI, numerous PYs LUs and others — "More than enough to keep one on forty meters these days." . . . W2CUQ/3's 4.9 watts made the grade with many Europeans, KH6AYG, IT1TAI, VP5BM and ZP6CR. Will recommends a 5016GT final for a bit of sport on forty. . . . Hopscotching hamshacks hither and yon for 7-Mc. items, K2EPP: FA30A 23, FM7WP (20) 22, W4BXV: FAS, Europeans, HH3DL (6) 5, VP4BN 6, W4GCB: YU2IP, W4YOK: HK3KG, HRI, TI2CR, K4ADU: KV4BK (178), one HK5M, KL7s, VKs and ZLs, W5YBF: KT1TW, W7AHX: FG7XB, ZSs, W0VB5: TI2ES. . . . Moving upband, KN4CQA goes in for Novice-style DX in no small way. CM2PX, KN4AZY/VP9 (I), KV4BK, W6BGL and XE1KB wound up in Henry's bag. . . . Before becoming W7WSS, WN7WSS chatted with CE3DZ and JA8AQ on 40-meter W/N/K frequencies.

**160** c.w. continued to produce unusual midsummer DX at W1BB and other East Coast stations. As late as July 31st W1BB worked G3JVI 3-4. W3RGQ also was heard on the other side around this time. G3s GGN and

ERN are in there pitchin', too. W1BB opines that only the static level holds down hot-season 1.8-Mc. DX — the signals are there if activity exists at all. Whether winter or summer, keep an ear on one-sixty for one of those rare cool and quiet nights — you may be pleasantly surprised!

It takes the contest season to stir up much excitement on **ten** and **forty** 'phone at this stage of the solar cycle. NNRC's kilocycle inspectors hear HK4DT, JA1s AAX AD ADL AEO AFU AGU ALD ALL ANR AOD AOO AT ATW CE CU DY GE JO JS JV MR SW VP, JA2CF, JA3s EY IIF MD, JA6s AE SO, JA7s BV DB, JA9s BY, DO, KG6NAA and KW6BB creeping through on 7-Mc. voice. . . . CTISX, CX4CS, EA5 1CU 4DD, DLs 1HS 6RG, DM2APM, 1Is ACL BEM, SM5DRG, TI2s MS RL and VQ4AQ are reported among the audibles on 28-Mc. 'phone frequencies.

## Where:

G3KCE, one of MP4QAJ's former ops, unravels confusion ament the status of MP4QAJ and OD5AF. These two stations were operated jointly by G3KCE and the present legal licensee of OD5AF, both of whom are airlines-men. Now that Roger has left the scene, OD5AF continues to operate both stations. G3KCE lately flies a route which includes stops at Nairobi so you'll be working him as VQ4FX. QSL MP4QAJ and OD5AF to Box 150, Tripoli, Lebanon. . . . Openings to Asia still aren't on a pipeline basis but neither are they as ephemeral as they were a couple of years ago. K6DV finds that the MARTS (Malaya) bureau disgorged 900 QSLs to 63 countries during one recent month. . . . Ex-ET3S, now VE3RE, rolled up 155 countries in Ethiopia during the period July 15, 1954, to May 10, 1955, using a 4-stage 814 rig, 12-tube receiver, dipoles and a Lazy-H beam. Phil still awaits QSLs from some of the rarer items logged although one dandy did come through from ZC3AC. Drop a line to VE3RE if you have ET3S QSL problems. . . . W1WPO points out that the present VQ8AG attests to no responsibility or connection with VQ8AG operation prior to February of this year. Frank gets around on 20 c.w. quite handily with a c.c. 2-stage 20-watter, a modified bc. 5-tuber and a long-wire radiator. . . . HBNU/Trieste, perhaps the most active 11/T on DX bands, strongly emphasizes that incoming QSLs should be sent only via ARI or direct to F. Venezian 5, Trieste. . . . All-band Faeroes DX champ OY7ML asserts that Box 184, Torshavn, is the sole QTH that ensures delivery of his incoming pasteboards. . . . From MP4JO's agent, W2PCI: "There will be considerable delay in QSL cards from MP4JO. . . . Some of the fellows are sending follow-up cards and letters that are keeping me busy to answer — just got hit with 52 cards in the same mail!" . . . H1SWF, inactive since July 1st of last year, knows nought about the current usurper of his call. — W6CUQ. . . . FOSAC indicates he's now up to snuff in the confirmation department after shipping stacks of cards via bureau-bound slow boats. . . . From the mill of Washington, D. C., Postmaster Roy W. North in a letter to DL4ZC: "You are advised that Germany, Latvia, Lithuania and Estonia are the only countries with which we do not exchange international reply coupons." DL4ZC adds that IRCs also are

unusable at APOs . . . . . "We are getting complaints from W hams not receiving F8FW/FC QSLs although USKA sends these cards directly to the ARRL QSL Bureau for each call area. . . . Those not having received F8FW/FC QSLs in due course should apply for duplicates." USKA answers F8FW/FC QSLs when received—you fellows keeping envelopes on file with your call area QSL managers? . . . . . Time to reiterate, as we periodically do, that information and addresses appearing in this rubric are by no means necessarily official or guaranteed accurate. Frequently they are second-hand scuttlebutt items of doubtful origin. They are reproduced in the hope that they may lead someone to a fast QSL or two. Incidentally, when the QTH of any given station appears a second or third time, use the address most recently published. Early versions often are fragmentary to the point of unreliability. The following QSL catalog is testimony to the benevolence of W1s OJR UED WA1 ZDP, W2BRV, K2s BZT GJO, W4s GCB YOK YZC, K4ADU, WN5KNE, W6s AM NJU UED YY ZZ, W8KAK, W9s EU UKG, W0VFM, DL4ZC, HE9RDN-USKA, ZD6BX, V. Brenner, NCDXC, NNRC, SCDCX and WGDNC:

# Whence:

**Asla**—This month's W6YY one-man DX omnibus is ornamented with many an Oriental item: VS2DQ has ZC3 intentions upon returning from his U.K. holiday. He mentions one of the hazards of hamming on Christmas Isle—gregarious eight-foot land crabs. . . . VS6BE awaits delivery of a brand new KW-1 and 75A-4. . . . XZ2KN's protruding signal does credit to a newly installed 6-element beam. . . . C3WV fires up several evenings per week with a BC-610, 51J and half-wave vertical. Dick is slated for return to Uncle Sugar this month and hopes his relief will keep C3WV available. The other Formosan active, BV1US, is located some 150 miles to the south of C3WV's diggings. . . . VS2DW, who states he's the only native Malayan licensed, writes W9VP of DX-band trials and tribs. The Dancing-Witches BC-610 expired in smoke some time back, requiring him to fall back on a c.e. 6V6-6L6 combo which, surprisingly enough, performed quite comparably. Tan uses dipoles and a thoroughly revamped HRO-M inhaler. When not performing official duties as a legal interpreter in Ipoh (now quite a boomtown), VS2DW hits 20 meters and keeps the peace in a household which includes three sons and a daughter. His particular pet peeve is the DXer who far exceeds the bounds of civility in pursuing an inadvertently tardy "First VS2!" QSL. . . . W6AM reports that public demand forced XW8AB to scrounge up parts for a modulator after dispensing scores of Laos c.w. QSOs. . . . W6CRV, whose Saudi Arabia assignment was extended a month, has been assisted of late at HZ1AB by the keying and miking of K4DCC and W4EGG. Ron is the DXer of the group, though, and has pushed up HZ1AB's DX tally to a respectable 140/126. That's not at all bad in view of limited on-the-air tours and an accentuated traffic program. . . . K2IXD, one of OE13USA's mainstay ops for the past eight months or so, reports fabulous hospitality from 4X4s AB AE AH AM AS BO BX CK CW CX DF DK DR FB FK FQ FS FV GB GT II and associated SWLs during his recent two-week stay in the Holy Land area. One feature of Marty's visit was the ceremonious presentation of a well-earned 4X4-16 DX award, accepted by K2IXD on behalf of OE13USA. . . . A bow to JA1AA from W0VFM and the rest of us for scoring the first Japanese-national postwar DXCC.

**Africa**—ET3LF writes concerning a gala ham exhibit to be installed at the Haile Selassie I Silver Jubilee Anniversary Fair which opens in Addis on the second of next month. The Imperial Board of Telecommunications of Ethiopia intends to show off amateur radio to advantage. "We plan mainly operation on 20-meter c.w. and 'phone and, conditions permitting, we will be on 10 and 15 meters, too." The call isn't specified but if you encounter an expertly handled unfamiliar ET3 call early in November this should be explanatory. Souvenir QSLs doubtless will be forthcoming. . . . With an assist from buddy ZD6EF, ZD6BX blossomed out with a husky 805 final to replace his old trio of parallel 807s. ZD6EF frisks about on 'phone with a hundred-watt and ZD6RM sprinkles n.f.m. 'phone among his many 14-, 21- and 28-Mc. c.w. QSOs. (Yes, we said 28-Mc. c.w.!) "There may be another ZD6 active soon, solely on 'phone. . . . We now have 50 Mc. open for ZD6 fellows and gear for that band already is under construction." Whoops—we're slipping into W1HDQ's domain! . . . . ZS1SW, who runs 100 watts from 3.5 through 144 Mc., and 50 watts on 432 Mc., sports this variety of skybait: a 320-foot wire on 80; 66-footer on

**LX1AO**, currently active on 80, 40, 20, 10 and 2 meters, pioneered amateur radio in the Grand Duchy of Luxembourg as far back as 1925. Jean's specialty is 'phone DX. (Photo via LX1AI of RLADC)

40; separate 4-element rotaries on 20, 15 and 10; 6-element spinner on 6; 24-element job on 2; and a 40-element array on 432 Mc. — all aloft 80 feet or higher. This from a QSL to W7PHO which also depicts the elaborate ZS1SW console-type operating position . . . . . EL2X, ex-DL1EA-OE13EG-W80FQ, closed his Liberian logs after collecting 219 countries. All states were worked on 14 Mc., and

FK8AH performs entertainingly on 14-Mc. c.w. and 'phone. Those in need of New Caledonian DXCC credit will find it to their advantage to join the pile-up over which he presides. (Photo via W1WFO)

all but one on each of 3.5, 7 and 21 Mc. "I heard W1BB, W8GDQ and W9PNE on 160 and managed to work W2GGL and KP4KD crossband, they on 160, me on 80. Sorry that I'm not going to be there this fall as I had planned a Vee for Top Band. I sold out the complete station to my replacement — he will be on 20 for sure as he has my new 3-element Telrex. . . . Over 7000 EL2X QSOs from January, '54, through June, '55, with a couple of months off for vacation. Contests sure run them up!" . . . . . ZS5s AZ BF CY EG EZ JF JK KL LA OJ PB and PK manned impressive all-band installation ZS5DHE at the Durban Hobbies and Crafts Fair this summer. Did you dig that souvenir QSL?

**Oceania** — W1A (Australia) and NZART (New Zealand) invite world-wide participation in the 1955 VK/ZL DX Contest to be held ('phone) from 1000 GMT, October 1st, to 1000 on October 2nd, and (c.w.) from October 5th through 9th, same hours. The serial exchange is the usual five-digit (A3) or six-digit (A1) figure — RST001, RST002, etc. — except that an operator may commence operation with any number between 1 and 99. E.g., your first QSO can be numbered RST063, your second contact RST064, etc. Any amateur band can be used. *Scoring:* One point per contact, each station to be worked but once per band, this point total to be multiplied by the combined numbers of VK/ZL call areas worked on all bands (ZL1 through ZL4; VK1 through VK9, excluding VK8). *Logs:* For each contact record the date, GMT, band, call, and serials sent/received in that order. Use a separate sheet for each band and underline each new band-area as worked. Attach a summary sheet bearing total score, a brief station description and a signed declaration that rules have been observed. Entries must be postmarked on or before October 31, 1955, addressed to W1A Federal Contest Committee, Box 1234K, GPO, Adelaide, S. A., Australia. From these will be ascertained winners of certificates to be awarded high scorers in each ARRL DXCC Countries List country and U. S. A. call area. *Note:* There is no provision for multioperator work in this competition; operators manning the same station will submit separate entries as individual competitors. Good fishing! . . . . . One more peek at W6YY's dopesheet, this time from an Oceanian angle: VR2AB tried a few QSOs as VR2AB/ZM6 this summer, traveling via the Tokelau where he (sob!) found no opportunity to fire up. Friend VR2BZ still entertains strong slant-VR5 notions. . . . . YJ1DL, intermittently active on 20 and 40, states that the McCoy YJ1AA has not been active during the past year because of power deficiencies. . . . . No. 1 WAVKCA DX award (see p. 63, August QST) went to W6YY. . . . . All-band DX phenom DU7SV reached the DXCC-mark in the confirmation department. A hearty huzzah for Volt — DU7SV no doubt could have worked dozens more countries if he had hardheartedly ignored the DU-hungry W.K. pack always yapping on his heels. . . . . KC6CG (W2UDI) has another month or two to fatten his log before moving Jerseyward. — K2GMO . . . . . VP2VB/P (ex-G7DW) heads out of the Caribbean for the open Pacific aboard yacht *Tasme*, bearing a pair of self-powered ham stations courtesy the good offices of KV4AA. Danny hopes to anchor and operate gear ashore from various DX points while circumnavigating westward.

**Europe** — K2IXD (OE13USA) tells W1VG that OE13s will be no more. The advent of the Austrian Peace Treaty brought this about and the resident OE crew will take over on DX bands in good stride. OE13USA recently managed to accumulate the wherewithal for DXCC despite the heavy demands of frequent traffic skeds. . . . . GB3GP worked out of a Boy Scout camp in the U.K., according to W6KNE who gets in some SWling while stationed with the army in Germany. . . . . YU1GM hopes for a Pakistani or Ethiopian assignment since closing down in Belgrade. W6YY adds that Bob may head southward with the Byrd Antarctic Expedition come next fall. . . . . TF6WAK should be back home to take care of those Icelandic QSLs by now. . . . . New officers for the La Rochelle (France) Amateur Radio Club, which consists of Yanks in F7 clothing, are K2JCS (F7ER), president, and K9BGZ, secretary-treasurer. Competent service committees also have been designated. . . . . 9S4AX, who acquired an IIT-1S with DL4ZC's assistance, tells W9PRM he'll be greeting the W.K. gang with a new 829B final and 15-meter beam before long. . . . . As signified by the recent activities of HB1s KU and OP, Swiss hams once again may operate in Liechtenstein with that principality's prefix properly appended. . . . . IE9RDX mentions the possibility of HB9KB and associates putting a 3A2 call on the air during the first week of this month — QSLs to go via USKA. . . . . DL4PR, who is W3AZZ back home, has a Globe King, HQ-140X and 20-meter rotary about ready to go. Jim writes: "I attended a recent annual German-American Amateur Radio Club hamfest in Frankfurt which was attended by almost 200 hams and XYLs from surrounding Europe, a really fine affair." . . . . . Professional work temporarily has put the quietus on CT1CL's hamming but Gene hopes to be back in the swim before next summer. With 210 countries worked, QSLs from W7s GBY and WYM would complete CT1CL's WAS. . . . . EI3R, EI4AB and EI9Q were in the field operating "P" on DX bands during this year's successful IRTS (Fire) National Field Day. Considerable DX and many North American amateurs were worked during a hectic fun-filled 21-hour period. . . . . Three DXCC memberships from three different continents have been earned by Lt. Col. Lloyd D. Colvin, DL4ZC. His previous two DX triumphs were ticked off as W1KE and JA2KG. The colonel has operated under 18 different calls from all

Here's what the well-appointed Brunei hamshack will feature in the way of DX gear. VS5CT was a rare catch operated by G3DCT to the tune of 912 DX QSOs early this summer. Much of this equipment saw service as VS4CT in Sarawak and may now be in use under a British North Borneo call sign. (Photo via W5AL4, West Gulf DX Club)

over the globe and has had over 65,000 QSOs with amateurs in 242 countries. DL4ZC's wife and daughter also hold tickets. . . . . If you took your out-of-town vacation during the first two weeks of August, a favorite time for many, you missed a darned good shot at Andorra. PX1EX, representing a DX endeavor dreamed up by Fs 8FX 8EO 31B and 9UK, worked a flock of DX on several bands with an 807-final h.f. rig and a separate outfit for v.h.f. An IIRO with converters received and the antennae were a ground-plane for 20, Marconi for 40 and 80, and 3-element spinner for 2. Fine, guys — now how about IIV1EX and ZA1EX?

**South America** — W6ZLH of OA5G, back north on vacation, tried DX bands from California in late summer. George found being just another Six quite a bit different from his Peruvian DXperiences and he also missed the 800-foot-per-leg Vee he left down south. Regarding South American DXing, OA5G comments: "Fifteen has been

(Continued on page 142)

# Results, 21st ARRL DX Contest

*Entries Rise for Fourth Straight Year; 328 Earn Certificates*

BY PHIL SIMMONS, WIZDP

*"How high can scores go in an ARRL DX Contest? That question comes to mind each year when we analyze entries in these periodic contests of DX operating skill. And each year we say to ourselves in answer, 'This is it. We've reached the leveling-off point. It's impossible for scores to go any higher!' We've been wrong . . . which proves that impossible goals have just not appeared on the DX Contest horizon, at least not for the experienced DX operator who comes up annually with new score records or the neophyte who keeps improving . . . in an attempt to break into the top score brackets. It all adds up to the fact that these contests are great builders of operator-station performance. If DX is your meat, you'll continue taking part and become more skilled as time goes on; if you're new to DX operating, you just haven't been indoctrinated in the game until you've come through your baptism of fire in an ARRL DX Contest!"*

THOSE words, concocted by W1JMY in his 16th ARRL DX Contest round-up in September 1950 *QST*, are apropos today. Again the long-time enthusiasts returned, some to register postwar scoring records, and when the usual generous helping of fresh converts is taken into account, we emerge with 1242 entries (886 c.w., 356 'phone), up 11.5 per cent over 1954. There has now been a steady participation increase — 'though scarcely a meteoric one — in each of the past four Tests.

The *unexpected* makes every DX Test a continual game of fox and hounds, keeps the brethren hoping and hopping. An hour of fruitless calling elapses and you are as discouraged as a woodpecker in the Petrified Forest — suddenly three new countries reply in as many minutes and all thoughts of "pulling the big switch" are banished; now a block and tackle couldn't detach you from the operating position! This year TI9MHB, PJ2MA and HK0AI, in spots that even some DXCC Honor Rollers lack, injected spice. In February, 15 meters briefly cleared for Europe, allowing alert code proponents to hijack

several multipliers in a short span. A gorgeous array of African prefixes — including CR5, CR6, CR7, CT3, EA8, EA9, EA0, ET3, FB8, FF8, KT1, ST2, VQ2, VQ3, ZD3 — were catchable. KH6IJ and W6AM QSOd on 7 bands, and W4KFC did the same with HK4DP. W2SKE snapped up 16 countries on 10 'phone and was thrilled to raise Africans there for a change; Bill prophesies W/VE radiotelephone totals of *one million points* in sunspot peaks soon to arrive. The newly-introduced rule whereby Ws and VEs identified their states and provinces was happily endorsed by those in far-away places; many kept careful track of their states worked and several got all 48.

Let us pay tribute to such Test regulars overseas as CT1SQ, CT2BO, CT3AB, DL1BR, DL1DX, EA1AB, EA9AP, EI9J, F8VJ, G2PU (who has earned the last *nine* 'phone awards for England), G5RI, KH6IJ, KH6MG, KT1UX, KV4AA, KZ5BC, LA6U, LU3EX, LU9AX, OK1MB, ON4TQ, OZ1W, PA0UN, PA0VB, TF3MB, VK2EO, VK2GW, ZL1BY, ZL1MQ, ZS6DW — to mention a few. Each year they hurl themselves into the melee on one mode or the other, sometimes on both. When we raise them there is seldom a moment for even "HI JIM" or "PSD CUAGN OB," the hustle-bustle tempo being what it is. But they swap exchanges with thousands of us on numerous bands and we are grateful that they pop up perennially. Now that the furor has subsided, the League says, on behalf of the W/VE contingent, "MNI TNX OMs ES CU IN 1956." And sure-as-shooting we shall!

In line with long-established policy, competition for awards was confined to competitors in each ARRL mainland section and in each country outside the U. S. and Canada from which qualifying entries were received. Certificates of Performance will be issued in these categories:

	c.w.	'phone
Single-operator, W/VE	68	61
Multioperator, W/VE	3	1
Single-operator, non-W/VE	86	63
Multioperator, non-W/VE	1	0
Club	33	12

The 328 good-looking pieces of wallpaper are scheduled for mailing on October 15th, or

A Viking II, a 75A-2 and XYL-sponsored "coffee breaks" furnished EL2X any impetus needed to pace the Dark Continent on both 'phone and c.w. Ray has since bid farewell to Liberia, which now promises to become a real toughie.

**QST for**

thereabouts, and with each will go ARRL's congratulations for a job well done!

The 21st International DX Competition, however, was the only recently-scheduled ARRL contest which did not smash all previous records for participation (see Fig. 1). Despite vigorous advance promotion via IARU societies, foreign QSL bureaus, clubs and hundreds of prominent DXers, the success of the contest appears to depend principally upon the vagaries of sunspot numbers and the m.u.f. This, of course, is because it's a *DX* activity, not a domestic QSO Party, and as such it's particularly susceptible to the status of the ether. Under the rules U. S. and Canadian amateurs must work the 270-plus other items on the ARRL DXCC Countries List. It's the only contest in amateur radio which pits Ws and VEs "against" the world, and your letters tell us that you prefer it this way.

Even when the Kennelly-Heaviside layer just about dries up and blows away, more logs arrive from good old Europe than from any other continent save North America. Reflecting the reliability of the North Atlantic path, European high scores, like statistics dealing with valid entries, testify to the importance of ionospheric behavior. In 1949, for example, 13 European c.w. ops tallied over 100,000 points, and 26 did it in 1950. Their signals, with db. to burn, consistently blasted our eardrums on three or four bands during that banner era, an era when the Zurich sunspot count hovered well over 100. Alas, came 1951 and the average European score plummeted like a helicopter with a jammed rotor — GW3ZV, sporting a fabulous combination of gear and ability, was the sole 100,000-pointer. The next three dreary years drew blanks but results inched upward, and in 1955 DJ1BZ and DL1KB broke the tape at 138,462 and 102,258 points respectively. As Europe goes, it seems, so goes the DX Test!<sup>1</sup>

### The C.W. Section

When records are made, you can bet your r.f. gain control that W3BES will be involved. Mr. Mathis moseyed over to W2SAI (the boss himself was out of town) and, employing all bands but 11 meters, achieved 601 QSOs, a 246 multiplier and 443,538 points, a brand new U. S. A. single-operator high.

Others that reached the coveted 6-digit mark:

<sup>1</sup> There has been no change in the mathematics of scoring, but two special factors modify postwar European comparisons: (1) The twofold hiking of W/VE c.w. quotas has served to swell QSO figures of DLs, Gs and others in the densely populated countries. (2) 21 Mc., available the past three contests, has already upped South American and African results enormously; Europe-to-W/VE openings on this spectrum portion, however, have been infrequent and thus far have affected European totals to a negligible degree.

VP7NM dispensed 1939 A-1 exchanges on all bands 1.8 through 28 Mc. for 453,725 markers and third high non-W/VE. Charles, proprietor of the Bahamas QSL Bureau, has 142 confirmed on the DXCC roster. You can QRQ to 50 w.p.m. in his direction any old time — he's an ex-commercial op.

Fig. 1 — Total number of valid entries, c.w. and 'phone, in the 9 postwar ARRL International DX Competitions.

W4KFC 426,024, K2EDL 400,200, W3DGM 385,548, W4DHz 4 370,962, W4CEN 330,336, W3LOE 325,717, W3BYN 313,110, W2WZ 306,838, W3EIV 277,440, W6GAL 7 254,592, WSFGX 249,504, W3GHS 234,765, W3JTC 227,367, W3JTK 225,888, W5PQQ 220,473, W4YHD 188,543, W4OM 187,488, W9IOP 176,904, W1BFT 171,687, W4DQH 168,795, WSBKP 167,796, W6VUP 165,600, W3HEC 160,038, W8BTI 159,852, W9HUZ 159,360, W9LNM 153,180, W9FJB 150,234, W6RW 148,920, W1BIH 146,861, W1AXA 143,934, W1TYQ 140,448, W1JEL 139,722, VE4RO 137,160, W8DUS 136,782, W5CKY 130,077, W3KT 126,900, W6MBA 126,153, W3KDP 125,936, W6KEV 124,605, W4UXI 122,264, W1AZY 120,834, W4LZF 120,096, W6WB 119,340, W6FSJ 118,491, W3GHD 118,170, W2DOD 118,054, W4MZP 115,506, W3EKN and W3MFW 114,972, W1BOD 113,577, W3ADZ 110,565, W9VUL 110,403, W5DWT 110,336, W2AIW 110,166, W4CC 105,705, W1ODW 104,775, W9DAE 104,538, K6CIT 104,544, W1TX 101,748, W11DL 100,564.

Another precedent-wrecker was the 514,080 points of W3CTJ, jointly manned by W3s CTJ and NOH. Maury and Al racked up a four-day

Herewith a couple of elaborate antenna layouts that paid off handsomely in the scoring columns. *Left:* W6YMD's beams and verticals form picturesque angles as they jut skyward at Pacific Palisades; that's the base of the 3.5-Mc. ground plane in the foreground. A quintet of Southern California DX Club brasspounders utilized the whole shebang to good avail, got a thumping 363,480 points. . . . *Right:* Have a look at the maze of 48 elements comprising stacked Yagis for 14, 21 and 28 Mc. at W2SKE/2. The 108-foot mast is self-supporting and rotatable. This awesome structure helped Bill nab second position among U.S.A. 'phones.

DXCC with 101 countries worked, a multiplier of 255 and 672 QSOs.

These efficient crews also finished up admirably in the more-than-one operator goings-on: W6YMD 363,480, W4KVX 358,974, W6ITA 314,820, W6TT 284,271, W3ALB 256,896, W6LDJ 244,620, W9AVJ 207,765, W3ECR 189,879, W6AM 185,370, W3GHI 164,088, W6GTI 134,670, W6LDD 112,266.

In the overseas division, contester par excellence KH6MG remained in top form, beat out the rest of the non-W VFs with his 2203 QSOs, 74 multiplier, 489,066 points.

The continental yardstick is probably the fairest for study of foreign scores. Sorted in that fashion, the leaders shape up thusly: *Africa* — EL2X 182,373, EA9DF 127,661, OQ5GU 113,490, CR6AI 104,400, FA9RW 97,290; *Asia* — JA1CJ 50,715, KR6LJ 40,560, JA3AF 38,529, JA3AB 25,766, KA2OJ 21,947; *Europe* — DJ1BZ 138,462, DL1KB 102,258, OE13USA 98,805, DL4ZC 91,875, G5RI 89,712; *North America* — VP7NM 453,725, NE2OK 308,636, KG4AJ 302,849, KV4AA 296,140, KP4CC 247,040; *Oceania* — KH6MG 489,066, KH6J 461,700, ZL1BY 306,408, KH6PM 237,006, KH6AYG 211,526; *South America* — HK4DP 232,712, LU3EX 185,304, LU8AF 156,771, PY7AN 109,620, CE3AG 98,340.

### The 'Phone Section

In the frenzied battle of the microphones, veteran DXer W1ATE set a staggering all-time high of 492,184 points. Chad, with his lavish

antenna collection, scored everywhere from 160 through 10 but had his best luck on 20, where 435 of 690 QSOs were consummated. He also snared 105 different countries for a multiplier of 238, was active 94 hours out of the possible 96.

Other extraordinarily successful huffers and puffers: W2SKE/2 439,356, W4KWY 282,540, W6YY 233,444, W3DHM 230,640, W4OM 214,884, W2WZ 173,160, W3GHS 158,410, W7ESK 151,200, W9EWC 139,500, W4DQH 119,915, W8NXF 101,178, W4EEE 100,602, W6VSS 99,231, W8RLT 89,916, W8LKH 88,832, W3JNN 86,697, W8DUS 67,041, W3CUB 64,842, W5KBP 62,496, W7DL 59,584, W6IDY 59,040, W4CBQ 55,872.

These partook of the verbal fisticuffs on a "Winter Field Day" basis and fared well as multioperator set-ups: W2SAI 314,880, W9AVJ 141,614, W8BKP 133,569, W6AM 124,413, W8NGO 91,432, W3GHI 75,864, W8NWO 74,466, W6WZD 66,846, VE3RCS 56,158.

Hawaiian KH6IJ shoved aside his electronic key, unshorted the modulation transformer and QSY'd to the 'phone segments. And before he plopped into his four-poster on March 13th, Katashi had logged 918 contacts, a 59 multiplier, and 162,486 points, the huskiest tally from overseas.

Continental pace-setters: *Africa* — EL2X 81,405, ZS6DW 41,140, EA9AR 13,524, ZE2KR 9675, CT3AE 6831; *Asia* — KA2OJ 3531, JA1VP 450, JA4BB 450, OD5AB 336, HZ1AB 234; *Europe* — CT1SQ 46,440, EA4DL 27,552, OE13USA 16,548, EA4DR 13,248, ZB2A 12,213; *North America* — VP7NX 148,665, VP6WR 127,098, HP3FL 73,017, VP9L 66,317, KG4AJ 55,044; *Oceania* — KH6IJ 162,486, KH6PM 90,576, KH6ANH 59,040, KH6MG 35,100,

Multiplier-hungry DXers welcomed with open arms an EA6AF 25-hour 3-band junket, during which Bartolome's 50-watter culled 34,488 points and A-1 honors for the Balearics.

## The Clubs

The cocobolo gavel with the engraved silver band, issued annually to the club whose members accumulate the largest aggregate score, is dearly sought after indeed. Some groups, we're told, employ any method short of the cat-o'-nine-tails to effect a full turnout. Winner in 1955 was once again Philadelphia's Frankford Radio Club, whose 41 entries added up to a brilliant 3,753,930 points. In a valiant bid to repeat their 1950 gavel-winning drive, Southern California DX Club members forged into second position only 265,000 points shy of FRC's total. The accompanying tabulation shows the standings of the 36 competing groups and the calls of their 45 certificate awardees.

## Disqualifications

The following are deemed ineligible for score listings or awards. In each case disqualification

VP6WR knuckled up to 127,098 points, ranked number three among the 120 foreign radiotelephones. Woody used a pair of 807s, modulated by more of the same, to twirlers of the plumber's delight variety, a long wire and a Windom. Best band: 21 Mc., where he snagged 234 of his 625 contacts.

is for off-frequency operation as confirmed by a single FCC citation or two accredited Official Observer measurements: C.W. — W2ESO, K2GAL, W0GXI/0, W0RLI, KC6CG; 'Phone — W3ALB, W3VKD, W3YRK, W3ZQ, W4AIA, W4NHF, W4RRK, W4SOV, W5FBW, W6BYB, W7JLU, W9AMM, W0LBB, W0VIP.

— . . . —

Propagation specialists agree that we are presently poised on the threshold of a DX millennium. Thousands of new amateurs are expected to succumb to the lure of DX as, starting very soon, they enjoy their first taste of ideal conditions. How are *you* fixed for the bonanza? The time is ripe to reduce s.w.r.s, scrape the rust from the 10-meter rotator, lick any 21-Mc. TVI and align the inhaler, if needs be. Don't be caught flat-footed. Take the action required to get your station functioning at peak efficiency *now*, because the 22nd ARRL International DX

October 1955

Competition will be upcoming almost before you know it! Watch future *QSTs* for details.

## C. W. SCORES

### Twenty-First International DX Competition

Operator of the station first-listed in each section and country is winner for that area. . . . The multiplier used by each station in determining score is given with the score — in the case of U. S.-Canada this is the total of the countries worked on each frequency-band used; in the case of non-W/VE/VO entries it is the total of the U. S.-Canada districts worked on each band. . . . The total number of contacts is listed next. . . . The letters A, B, and C approximate the input to the final stage at each station; A indicates power up to and including 100 watts; B indicates over 100 watts, up to and including 500 watts; C indicates over 500 watts. . . . The total operating time to the nearest hour is given for each station and is the last figure following the score. . . . Example of listings: W3DGM 385,548-228-565-C-83, or final score 385,548; multiplier 228; 565 contacts; power over 500 watts; total operating time 83 hours. . . . Stations manned by more than one operator are grouped in order of score following single-operator listings in each section or country tabulation; calls of participants at multi-operator stations are listed in parentheses. . . . Where three or more multiple-operator entries appear, the top-scoring station is being awarded a certificate.

By checking in with 330,336 points, W4CEN extended his streak to five North Carolina c.w. triumphs. The 75A-3 above is flanked by the exciter unit on the left and the final amp, parallel 4-250As, on the right. Tom, a star performer in the shindig since the Thirties, labels it "THE Contest," is presently toiling with a 2-element 7-Mc. beam to boost his percentages in the 1956 dogs.

This neat arrangement features (from left) a p.p. 810s rig, voltage regulator, VFO, 'scope and HQ-129X. It's the property of CT15Q, top voice man for Europe with 46,440 points and 389 contacts, 47 of which came about on the allegedly uninhabitable 40-meter 'phone band. Nice going, Humberto!

**Timber!** While he transmitted "569 KANSAS" to HADW the first morning of the c.w. affair, W0DAE's 70-foot tower collapsed. Undaunted, Jack carried on with makeshift skyhooks, got 104,538 points, tops for his call area and section. Dry those tears of sympathy, fellows! DAE is back in business with an effective assortment of rotaries, doublets and ground planes.

Of all the areas around the globe, Asia has perhaps been hardest hit by the ionospheric doldrums of recent Tests. In 1955 Tokyo's JA1CJ, unimpressed by the propagation forecasts, stacked 485 QSOs for 50,715 points, the largest c.w. total out of the Far East since 1950. (Photo by JA1GTV)

(Continued on page 134)

CONDUCTED BY EDWARD P. TILTON, W1HDQ

It is now more than two years since the first work of W4HHK, W4AO and W2UK in sending 2-meter signals over long paths by meteor scatter was reported in these pages. In this time tape recordings have been played and the general subject discussed in nearly all parts of the United States, and the work has attracted considerable favorable attention in scientific circles. Relatively few 2-meter men have been more than casually interested in the new method of working v.h.f. DX, however, and you can count on your fingers the number who have actually tried it.

Yet W4HHK, who was in there first, has had exciting success in working 2-meter DX by the meteor route. Two-way meteor communication with New Jersey (W2s UK, AZL and NLY) and Connecticut (W1HDQ) was achieved last year, the contacts with all but W2UK coming at the height of the Perseid meteor shower late August. The Perseids put on a show last August, peaking just before the middle of the month, so W4HHK was busy again this summer drumming up some schedules for exploitation of the opportunity they would afford in 1955.

New states were the objective, and there were at least two good prospects. W1FZJ, Medfield, Mass., a big-antenna man from away back as W8UKS, had been burning up the 2-meter band with a high-powered rig and a 64-element array. He was an almost certain bet for the first Tennessee-Massachusetts 2-meter QSO. Some sign of signals had been heard from W7VMP, Phoenix, Ariz., in the past, so Paul lined up a series of morning skeds with the Fenwick brothers, too.

A test with W1FZJ on Aug. 12th produced the first break. Using the one-minute-each-way method that had worked so well under marginal conditions last year, Sam and Paul started in at 0500 CST. Nothing was heard for 45 minutes, but at 0545 W1FZJ was heard calling and breaking. Complete exchange of signal reports and confirmations was accomplished between then and 0556.

Then followed an hour test sked with W7VMP, beginning at 0600 CST. Several calls and signs were copied, but no complete exchange was possible until the following morning. On the 13th, just an hour was consumed in exchanging calls and signs, signal reports and final confirmations. One not accustomed to meteor-scatter talk would not think much of the QSOs that are achieved by this hit-and-run approach, but the fact remains that useful information can be exchanged and positive identification established by the meteor-scatter method. You have to send

fairly fast, on c.w., and you have to try again and again, usually; but if we judge a QSO by whether or not useful information can be exchanged, then certainly these meteor-scatter tests qualify. Much more so than some of the exchanges that pass for QSOs in DX pile-ups or during some of our more hotly-contested operating activities on lower frequencies!

The W1FZJ-W4HHK contact was good for more than 1100 miles, and the W7VMP haul is just under 1300. The limit? Who knows, for sure? What we need is more of this sort of thing, to find out. Surely meteor scatter represents a way to communicate with states and over paths that are highly unlikely to be bridged on 144 Mc. by other means. It put W4HHK at the top of the

Calls in bold face are holders of special 50-Mc WAscertificates listed in order of award numbers. Others are based on unverified reports.

states-worked standings, with 28, and he is the only operator known to have worked 9 call areas on 144 Mc. Shouldn't this be enough to stir up some interest on the part of other 2-meter DX hounds?

The possibilities of the 6-meter band in this department should not be overlooked, either. In fact, the chance of working long hauls under otherwise dead-band conditions is probably much better on 50 than on 144 Mc. The potentialities of the 50-Mc. band will remain hardly more than touched, so long as the vast majority of 6-meter men operate with low power, small antennas, no better than mediocre receivers, and voice. At least a few of us should be going for the limit in all these categories, and on c.w. There are some surprises in store on 6, we're sure, when we give it the full try.

### Here and There on the V.H.F. Bands

The discussion of national calling frequencies for the v.h.f. bands (August *QST*, page 57) has so far brought only three written responses. W1DPO, Chatham, Mass., and WN9OKB, who travels widely, are all for the idea. W3OTC likes the idea too, but suggests other channels than the 50.1- and 144.6-Mc. in the original proposal.

Bob feels that the 6-meter channel should be in the lower c.d. segment, and suggests 50.4 Mc., already widely used by nets in many parts of the country. He says that members of a fixed-frequency net in Annapolis have worked 18 states with both transmitters and receivers set on this channel. For the 2-meter band, W3OTC wants the channel to be in the Novice band. This also takes care of the c.d. angle, but no specific suggestion has been made as to what the frequency should be. Suggestions?

A special frequency to monitor would be helpful to fellows situated like XE1GE, Cuernavaca, Mexico. Jeff has heard DX signals in the region just below the 50-Mc. band many times when no amateurs could be heard. It is interesting

to note that he has found some resumption of the spring-fall 50-Mc. DX between Mexico and South America in 1955, after a lapse of several years. XE1GE heard harmonics of Latin American stations in and near the 6-meter band several times in March and April. LUSAE and LU4BJ were worked on March 12th, his first South American DX on 6 in 4 years.

Single-hop contacts were made with several W5s during the May-to-July *E.* season, and on July 21st, W1CLS, W1VNH, W1HDQ and W2MEU were worked, between 2000 and 2045 CST. These are the first XE — W1 and 2 contacts since about 1950, as far as we know. The 50-Mc. DX in May, June and July was better all over the country than in several years past, so it looks as if we're on the upgrade again.

The  $F_2$ -layer predictions issued by the Central Radio Propagation Laboratory begin to look interesting again, too. The charts for November actually show a small ellipse of 50-Mc. m.u.f. just above Latitude 20 North in the Pacific Ocean area. KH6s please take note! North Africa, Southern Europe and South America give indications that 50 Mc. might be open for  $F_2$  DX on the peak days in both October and November.

Here's a late 50-Mc. DX report. (Late because it came to your conductor's home address, and got mislaid in personal papers. Moral: Mail v.h.f. news to ARRL Headquarters, *not* the home address of W1HDQ!) VP9AY made what is believed to have been the first 50-Mc. contact from Bermuda, working W2KNQ, on June 23rd. W21DZ and W2MEU were worked the same night. On June 26th, Max (now W1TJZ) worked W2OHJ. W8CMS, W8SVY, W8NQD, W3ZKR and W8IHH between 1935 and 2245 Bermuda time. Signals were heard from W1, 4, 6, 7 and CO.

VP9BM writes that while he is doing his best to work some 144-Mc. DX from Bermuda (he's on 144.35 Mc.) he is working on a receiver to provide continuous monitoring of the f.m. services just below the 50-Mc. band, to give him tip-offs on possible 50-Mc. DX to W.

In addition to his 5-over-5 that's 120 feet above ground in Johnstown, Pa., W3TIF has erected a 4-element array atop 2700-foot Pleasantville Mountain near by. Doc drives up there and operates his TBS-50, and occasionally a 200-watt 24G amplifier, in search of contacts with Vermont and Rhode Island, two of the six states he now lacks for WAS on 6.

Members of the Andrews Electronics Association, whose 50-Mc. club project was described in August *QST*, operate their Windbag Net each Tuesday night at 1900 local time. Frequency is 50.4 Mc., and at present 10 members are active. Daily at 1730 EST an informal get-together is held, this spreading out over Pennsylvania, New Jersey and Delaware. Everyone is invited to join in helping to keep the band hot through the fall and winter months. This from W3RV and W3ZQD, who started the ball rolling.

Two more 50-Mc. men reached the coveted 48-worked spot this month. W0DZM, Minneapolis, who had been on the hot seat with 47 for years, finally caught up with W7JRG, Billings, Mont., and got the cards through in time to qualify for special 50-Mc. WAS Award No. 13. W0HVV, Pleasant Hill, Mo., was the beneficiary of an expedition to Rulo, Nebr., by W0QZT. W0HVV had done this same favor for W0INI a couple of years ago, so it was quite fitting that he should make his 48th in a similar manner. The Nebraska activity, what little there has been in recent years, has been beyond the reach of Missouri stations, even though the two states share a common boundary in some 50 miles of the Missouri River. The cards for official confirmation have not yet been received from W0HVV as we write but he is in line for No. 14. The W0QXT expedition also provided first Nebraska contacts for W0s PYK TOQ VFF VRF WNU and YKI.

This array helped to make the first 50-Mc. WAS by a W2. The stacked 4-over-4 at W21DZ, Denville, N. J., has a 12-element 2-meter job in between the 6-meter bays. The 2-meter portion may see some service now that Ed has nailed down the elusive 48 on 50 Mc.

**QST for**

Ed Ladd, W2IDZ (right), shows off his 50-Mc. WAS certificate, while the team who helped make the achievement possible look on. Left to right, Roy Sebring, W2QCY, Reh Allen, K2ODA, and George Whattam, W2CZE, of the W2QCY/7 50-Mc. expedition to Utah and Nevada. Event pictured was a picnic in honor of these 6-meter stalwarts at the Greenwood Lake home of W2KNO.

V.h.f. men of central New York are invited to a V.H.F. Round-up being planned by the Syracuse V.H.F. Club, Saturday, Oct. 15th. Starting time will be 2 P.M. Location: Frank Taylor's on Route 11, North Syracuse. Speaker: Art Koch, W2RMA, well known for his v.h.f. and microwave gear in the *GE Ham News* and *QST*. Price: \$2.50, including dinner. Tickets and further information from Joe Lando, K2JIM, R.D. 1, East Syracuse.

Contacts over the Cascade Mountains to Eastern Washington on 144 Mc., distances of 150 to 250 miles, are reported by W7JIP, Portland, Ore. Higher power, big beams (horizontal) and better receivers are turning the trick. W7JIP's first contact over this route was with W7HEA, Toppenish, Wash. Both stations run about 500 watts. Contacts over the Cascades by W7LHL, Seattle, and W7s PYZ and UVH of Olympia, 130 miles, were mentioned last month. This work and the contacts over the mountains to Arizona from Southern California demonstrate that there is hardly any such thing as an "impossible" v.h.f. path at distances under 300 miles or so. The presence of high mountains in between you and your objective may actually improve your chances of covering the distance. Under ideal conditions this "obstacle gain" can reach quite remarkable proportions.

Another mountainous path broken down for the first time: W7JU, Boulder City, Nev., finally worked W7FGG, Tucson, Ariz., 353 miles, after almost a year of trying. W7JU runs 100 watts input, c.w., feeding a 6-over-6 horizontal array.

There never has been enough use of the consistently good conditions that prevail on the v.h.f. bands in the morning hours. VE3DER, Toronto, would like it known that she calls CQ to the west each morning at 9 on 144 Mc. If no contact is made she also tries east and south.

Two-meter mobile record? G2HCY asks if his contact with F9JY, Cherbourg, 250 miles, has been bettered by a 2-meter mobile station in this country. He was actually in motion at the time contact was made, traveling about 3 miles south of his home in Warrington, Lancashire. He has also worked EI2W while mobile, at a distance of more than 200 miles.

### Those States-Worked Boxes

Every few days someone writes in to know how to get his call listed in the 50- or 144-Mc. states-worked standings. The answer is that you just send in your record. No QSLs are needed, unless you are claiming WAS; in that case we must have proof in the form of 48 cards. A special hand-lettered and serial-numbered certificate is awarded to anyone who makes the grade on 50 Mc. and can prove it. We may have to get a 144-Mc. WAS award ready one of these days, at the rate some of the gang are going, but up to now we'll take your word for the number of states, call areas and best DX you've worked on 2.

Obviously, we can't list every active v.h.f. man in these boxes, so we try to spot the outstanding achievements in each call area. A W6 with 3 or 4 states has done an outstanding job, but a W1 or W2 with 12 may never have done anything noteworthy. W1MMN, in northern Vermont, has worked hard for his 10 states, so he stays in, but a Connecticut station with 12 hasn't done much yet, so he stays out. A rule-of-thumb check on whether you'll be accepted for listing is to see if your record is equal to or better than some fellow in your neighborhood who is already listed. If it is, you're eligible. And once you're in, be sure to let us know when you move up in any category.

Canadian Provinces do not count as states, and Canadian call areas do not count in the second column of the 2-meter listing. DX with a Canadian, Mexican or other non-U.S. station can be included for your best DX, however. Mobile or portable contacts made while more than 25 miles from

the licensed location are not acceptable for states claims by the mobile operator. Ship or aircraft stations are out, too.

We've received quite a few requests to begin listing similar accomplishments on 220 and 420 Mc. This would probably be done by skipping the 50- and 144-Mc. boxes occasionally, and running the box scores for the higher bands. If you want such a listing, now is the time to send in your records for those bands. If we get enough data we'll give the higher bands a whirl now and then. Include the number of states and call areas and your best DX worked on either band, or both, in your next report.

Special to Technicians — let's have your record for 50-Mc. work to date. We'll list any respectable total of states worked on 6 by a Technician. Don't feel that you have to wait to catch up with the fellows who have been at it for nearly 10 years!

### OES Notes

K2DYC, Phelps, N. Y. — Operating on 50.4 nightly, 7 to 9 P.M., looking for new stations. Western N. Y. activity on 6 very promising.

K2GAN, Murray Hill, N. J. — Experimenting with two-tube compact transmitter-receiver for 144-Mc. local communication, presently using two 12AT7s, and operating from 90-volt supply.

W2UTH, Victor, N. Y. — Much new activity on 50 Mc. Several Saturday morning skeds with W1HDQ, 250 miles, show slightly better signals on 50 than on 144, though evidence is inconclusive as yet.

W3OTC, Silver Spring, Md. — Good summer on 50 Mc. Worked 7 W6s on July 9th, along with stations in many other states. Band open more than half the days in July. VP9G worked July 19th.

W4FLW, Dresden, Tenn. — DX heard or worked 19 different days during July. Using converted Howard f.m. tuner to monitor 50-Mc. band. As it tunes broadly, signals will usually be heard if band opens well.

W5NSJ, Albuquerque, N. Mex. — Completed portable transmitter-receiver for 50 Mc. Works from 250-volt 100-ma. supply.

W5RFF, Albuquerque — Off the air due to damage to home and ham shack by flash flood. Antennas down; shack roof blown off, and ham library and QSLs ruined.

W5SCX, Ardmore, Okla. — Using Channel 10 transmitting antenna, W5LOW, Ada, Okla., was up more than 3 S units over normal signal. He worked Mississippi, Kansas and Texas Panhandle stations that were inaudible at W5SCX. The TV antenna is 700 feet above ground level.

W6CFL, Los Angeles, Calif. — Keeping nightly sked with K6KHD on 420 Mc.

W7JHX, Port Orchard, Wash. — Changed over to horizontal polarization in July, with varying results. Signals that were reflected from mountain peaks with vertical polarization now seen weaker and more subject to fading with horizontal. On the other hand, one of the stations so affected, VE7JG, Duncan, B. C., is able to work Seattle stations regularly with horizontal. These stations were not heard often with vertical. Check to be set up with W7BML, Port Angeles, Wash., who is on the opposite side of a 6000-foot range of mountains, at a distance of about 75 miles. Signals over this path have been mostly steady on vertical,

LILLIAN M. SALTER, WIZJE, Administrative Aide  
ELLEN WHITE, WIYYM, Asst. Comm. Mgr., 'Phone

**The Simulated Emergency Test.** By far the most important first-of-season activity is the SET. For ARRL Emergency Coördinators this is also their "annual roll call" time, and a time to extend the continuing invitation to *all licensed amateurs* to register in the AREC.

The SET as explained more fully elsewhere in this issue is a practical communications test exercise based on communications plans for the locality. For those in leadership capacities, Emergency Coördinators and Radio Officers as well as AREC members, it is the kick-off for the new fall-winter season of activity and the proper time to initiate the SET as the first of some recurrent planned tests to be held during the year. Responsible officials for the city or area and agencies to be served should be contacted by ECs, both to maintain friendly relations and so that full advantage of the exercise to improve on past deployments of mobiles and facilities, or get a statement or message from officialdom to transmit as part of the exercise.

There should be a workout for emergency-powered equipments, and an attempt made to build up our capabilities in both size and quality of performance in connection with this chance to demonstrate all our operative mobile gear.

ARRL's new *Emergency Radio Unit* placards are available through ECs for temporary or permanent use with cars or rigs and should be utilized at this time wherever justified by the equipment. All AREC members with mobiles also should ask ECs about the *Official Mobile Unit* pocket cards where mobile equipment has been acquired since a previous AREC registration. This as well as the regular AREC identification card will be issued by ECs where warranted. Purpose of these forms is to insure the individual operator better public understanding of his public and amateur radio service functions. The ERU card on one's car or set-with-handles advertises the public service aspects and identifies amateur work as more than a casual hobby!

We encourage ECs to sign up Novice operators in AREC (and newly licensed General Class personnel) as well as amateurs working *all bands* regardless of specialized interest. The availabilities of WNs and Technicians when registered will be considered by ECs and ROs to man circuits and posts and assist in other ways in the larger emergency plans developed by the whole amateur group. It is essential to create and maintain "one strong facility" through AREC/RACES in connection with general emergency work and civil defense planning. There are not

enough persons with advance training and skill to meet most emergencies, so every registrant fills a real need and should be made a part of the team. We suggest that local leaders schedule periodic discussion periods and operating exercises through the year and get the help of clubs in advancing know-how and in recruiting active amateurs. By critiques of the operations and classes to advance methods and procedures, strides in accuracy and speed of handling record communications are possible. All this helps each individual make of himself one of the more accomplished rather than merely casual operators in amateur circles.

Results of this test (the SET) are a barometer scanned each year indicating the over-all ability of amateurs to serve in emergencies. This test therefore calls for every active licensee to register with his EC or SEC . . . participating in every disaster and exercise as his circumstances permit. So be ready for this test, whatever form your local SET takes, on or about October 8th-9th. You as an individual, and your community, and the whole body of amateurs can thus demonstrate as fully as possible our communications readiness for either c.d. or natural disaster operations.

**Amateurs Again Serve in Flood Emergency; Report Your Part.** Once again scores of amateurs in and about the stricken communities of several states have risen to support the tradition of the amateur service for providing stand-by radio communications. We have reason to be proud of the radio work chalked up by amateurs which began following the unprecedented deluge delivered by dying hurricane Diane. As we write after five strenuous days, operations are still in progress from Pennsylvania to Massachusetts with radio taking only high priority traffic for those points in the Naugatuck valley (Conn.) areas where very limited wire service has been restored.

Since WIAW itself was engaged each day we had to suspend the code practice periods during the peak of this effort; we hope all parties will understand. The National Emergency Coördinator found himself in Pennsylvania, also hard hit by the storm. No few words can adequately record the operating events that have transpired over such a wide area in such a short space of time. But the NEC will start work on the story on return, when the radio work itself is completed and your reports are in hand. We want to call on each and every amateur participant to report his work, whether as part of an organized AREC or RACES facility, for governmental units or Red Cross or individuals —

so *QST* may accurately record the whole effort, and attempt to credit what (and how) we did. Be sure to include any pictures. Thanks. We'll have more to say on the emergency operating events next month.

**Additional FCC Suspensions.** Latest FCC actions enforcing indicated amateur service regulations are now reported. See page 70 of March '55 *QST* and page 68 of July '55 *QST* for suspensions covering other types of violations.

FCC ordered (August 10, 1955) that the amateur operator license of Ronald F. Ridenour, Denver, Colo., be suspended for ninety days, that the license be turned in to the FCC, and W6CNK not be permitted to be operated by any person in the 90-day period, *it appearing that the licensee* on various occasions during the period from September 1952 to June 1955 and particularly on June 4, 1955, violated Sections 12.91 and 12.93 of FCC rules by engaging in the operation of his station after changing residence from Fort Dodge, Iowa, to Denver, Colo., without first notifying the Commission's Field Office, Denver, of his intended portable operation, and continued such radio operation for a period exceeding four months without having his amateur radio licenses modified to provide for his change of residence, and *it further appearing*, that said licensee in this period failed to maintain an accurate radio station log and have same available for inspection by a representative of FCC, in violation of Sec. 12.136 and 12.137 of FCC rules.

FCC ordered (August 17, 1955) that the amateur operator license of Jack A. Gardiner, Havre, Mont., be suspended for sixty days, that the license be turned in to FCC, and W7DZF not be permitted to be operated by any person in the sixty-day period, *it appearing that the licensee* on March 13, 1955, operated on 14.197.9 and 14.198.1 kc., using A-3 emission in violation of Section 12.111 of FCC rules; also that he failed to respond to FCC violation notices pertaining to the alleged improper operation which is a violation of Sec. 12.155 of FCC rules.

**Stuttered Speech for Clearness?** "In the course of a study of voice communication that is being made at Ohio State University. . . . It was found that a radiotelephone conversation is much clearer if the speakers seem to stutter, that is, if they say 'wuh-one, tuh-two' instead of the usual 'one, two.' This method of saying 'wuh-one, tuh-two' is known as the 'bounce block' stutter. . . ." Quote is from the *New York Times*. K2FG wonders if this could lead to 'phone operator use of such expressions as "Bounce the blocks, Boy [i.e., please stutter], QRM is tough" or "Gimme that ole double stutter, friend. The block is bouncing." A few years of this and the only way the XYL can get through the OM's mental haze will be, "Nuh-now, duh-dear, Uh-about thuh-that nuh-new huh-hat." With tough going we'll have to stutter our way through. Speaking of intelligibility, the psychoacoustic laboratory at Harvard completed several outstanding studies during the last world war. Their conclusions — indicating that in any phonetic alphabet, the *more* syllables that can be used emphasizing a given character, the *better* the intelligibility — agree firmly with the above principle.

— F. E. H.

## DXCC NOTES

We should like to call attention to two matters concerning DXCC. A number of DXCC applicants, both for initial applications and endorsements, are neglecting to comply with rule 4 of the DXCC Rules (copy upon request). Rule 4 specifically states that a list must be sent in with all such

applications. Such a list helps keep track of your card mailings, assists in rechecking at future times and aids us in speeding service to all the DXCC gang. Your cooperation in complying with such rules will be appreciated.

At this time we'd like to make mention of a relatively new U. S. Mail service known as certified mail. As far as safe mail delivery is concerned, this new service does exactly the same thing as registered mail, but at less than half the cost of registered mail. Incidentally, registered-mail fees have gone up to 40 cents for North and South America and 55 cents for all other parts of the World (4 and 5 IRCs respectively). Regrettably, the certified mail service is applicable only in the U. S. and possessions.

In most AREC organizations, the EC has enough to do in just organizing and promoting. Yet, we here at ARRL are constantly hounding him to report: report this, report that, give us figures on the other thing, and so on. Along with this, we say we'd rather have an EC who does things but reports nothing than one who does nothing and reports just that.

The value of statistical reports is tremendous, and yet it's a big chore for the ECs to compile and submit them — especially for some ECs who are super-active when it comes to operations but not the slightest interested in statistics. We've done some thinking about this and would like to make a suggestion.

How about an AREC reporter? Our organizational standards provide for Assistant ECs to take on specialized departments of the work, especially in large organizations. Why not designate one of your members who is statistically inclined, or handy with the pen, as Assistant EC in charge of reports and publicity? It could be a big job, and a most important one. He would need to know what's going on in the AREC organization, how RACES is progressing locally; he would want statistics on all sub-groups; he would need contact with local newspapers, radio and TV stations to give the group's efforts publicity; and his would be the job of writing up regular EC reports for the EC's signature to go to the SEC or headquarters and any writing or reporting to be done for QST or other publications.

An Assistant EC serving as "AREC Reporter" would be most valuable in the larger organizations, of course — such as those in large cities. There, unlike the small community, the EC cannot do all the work. He has to delegate a lot of functions and be pretty much an overseer of work being done rather than the one who does the work. To an active amateur, overseeing is a harder job than doing the work himself; that's why many of our ECs are overworked and quickly burn themselves out. An AREC statistician or general reporter could do much to take some of the hated statistical and reporting burden off his shoulders. Has anyone tried this?

Supplementary "Operation Alert" reports:

In Omaha, two separate operations were conducted. One was to provide communication between c.d. Medical and 18 first aid stations. The other was to provide communications between county and state civil defense headquarters. The former was done on ten meters, with mobiles reporting in from first aid stations. The latter was done on 75, and a relay established between county c.d. headquarters and 2-meter control. Thirteen mobiles were operated and 18 other amateurs participated.

Here is the Mobile Squad of Civil Defense, Saline County, Salina, Kans. Most of them are members of the Central Kansas Radio Club. All members of the mobile squad are police commissioned and carry out their duties with the full support of the police. A great deal of commendable work has been done in this manner.

WSHZA reports that the West Virginia Net (WVN) in cooperation with the West Virginia Phone Net was active in "Operation alert" from 1600 to 2230 on June 15th. Ten meter links maintained contact between state c.d. headquarters (WSQHIG), the 'phone message center (WSCLX) and the c.w. message center (WSHZA/8).

Oregon SEC W7WAT reports participation in his section. In Portland, W7VS operated from c.d. headquarters under the direction of W7KY on 3995 kc. In Medford, participation was on a limited basis by members of the Rogue Valley Amateur Radio Club, including W7s HLF (RO) QMK ULR OFS and LYR.

On April 25th the Red Cross alerted the AREC in Hamilton, Ont., to render service in connection with a flood and high waves in the Crescent Beach area of Lake Ontario. Two mobiles were put into action at the Beach, and the Red Cross official was transported to the beach. Four mobiles and a control station saw action in this emergency.

— VESKM, SEC Ontario

On July 23rd a soldier drowned near Great Falls, Mont., in the Missouri River. Amateurs from Great Falls were called upon to assist in rendering communications between the scene and the Great Falls Army Air Base. W7PCZ/m operated at the scene while W7TSG and W7KUH handled other necessary communications contacts.

— W7KUH, SEC Montana

W7OKM was able to perform an emergency service on the "Seven Devils Road" (U. S. Route 101) between Coos Bay and Bandon, Ore., on July 31. Spotting a car off the road on the brush on one of the many bad turns in the road, he stopped his car and investigated. The stalled vehicle was from British Columbia and was teetering perilously on the edge of a canyon, occupants still inside and afraid to move. While W7OKM contrived to steady the teetering car, the British Columbia couple climbed out safely. Then he contacted W7VPF from his car and had him summon a tow car, which arrived 45 minutes later and pulled the endangered automobile to safety. — W7QKU, PAM Oregon.

We want to enter herewith a few words of praise for the Alabama Section emergency organization. There has just recently come to our desk an eighteen-page manual of "Instructions for Members of AEN CW and Phone Nets," issued and approved jointly by the Section RM (W4KIX), the Section PAM (W4WOG), the SEC (W4TKL) and the SCM (W4MI). Although the cover realistically states that the manual covers only the "barest essentials," it is one of the most complete and comprehensive section net operating manuals and directives we have seen. Other sections might well take a cue from Alabama on their fine net organization.

Fifteen SECs reported June activities, representing 5195 AREC members. Two reports did not include figures on AREC membership. Reporting sections: Minn., Wash., Tenn., West N. Y., NYC-LI, Georgia, Kentucky, San Joaquin Valley, Louisiana, Wis., Colo., S. Dak., Los Angeles,

The Western Illinois Radio Club of Quincy purchased this bus and turned it over to the city of Quincy to be made into a communications control center. The city purchased some equipment for it, and club members did most of the work installing it. It is intended primarily for civil defense use and contains several transmitters and receivers, a gas-driven generator and a public address system.

Mont., Ore. This June's results exceed those of June a year ago and two years ago, both in number of reports and number of AREC members represented. The mid-year record thus shows a gratifying, if not considerable, increase over that of last year. For example, at mid-year 1954 we had reports from 21 different sections; this year we have 26 different ones. At mid-year 1954 we had a total of 77 reports on file; this year we have 98. The record even compares favorably with our good 1953 record, but does not yet exceed it in all particulars. It would be easy to do so if more of you SECs would drop us a report on Form 8 each month.

The following sections have a 100% reporting record so far this year: Minnesota, Western N. Y., NYC-LI, San Joaquin Valley, Wisconsin, South Dakota. These have missed only one report: Washington, Tennessee, Georgia, Eastern Florida, Los Angeles, Oregon.

### RACES News

We have just received from FCDA a comprehensive listing of states and local areas now operating under RACES plans. Although it will take up quite a lot of room, we think it is worth reproducing here. The following states are now operating under state RACES plans: Alabama, California, Colorado, Connecticut, Delaware, Florida, Georgia, Idaho, Illinois, Kansas, Louisiana, Maryland, Massachusetts, Michigan, Minnesota, Missouri, Nebraska, Nevada, New Hampshire, New Jersey, New Mexico, New York, North Carolina, Ohio, Oklahoma, Oregon, Pennsylvania, Rhode Island, Tennessee, Vermont, Virginia, Washington, West Virginia, Wisconsin. That makes 34 states under RACES, leaving 14 who have not yet submitted RACES plans; however, of these 14, six have local RACES authorizations operating within them. Alaska, District of Columbia and Hawaii are also RACES authorized under an approved plan.

Following are the local RACES plans now in operation: **Alabama:** Jefferson Co.

**California:** Napa Co., Marin Co., San Luis Obispo, Yolo, Santa Maria, Sacramento Co., San Francisco, San Mateo Co., Contra Costa, Santa Barbara, Sonoma Co., San Diego.

**Colorado:** La Junta, Alamosa, Denver, Grand Junction, Colorado Springs, Fremont Co., Pueblo Co., Boulder, Adams Co.

**Connecticut:** New London, Portland, Naugatuck, Ansonia, Hamden, Bridgeport, Coventry, Middletown, New Britain, New Haven, Norwalk, Shelton, Waterbury, Watertown, Wethersfield, Southington, Redding, West Hartford, Plainville, Easton, Enfield, Glastonbury, Greenwich, Groton, Madison, Manchester, Mansfield, Milford, Monroe, New Canaan, Stafford, Stonington, Stratford, Torrington, Trumbull, Waterford, Windsor, Woodbridge, Bristol, Chaplin, Darien, Fairfield Co., Hartford Co., Norwich, Stamford, Willimantic/Windham.

**Florida:** Brevard Co. (Pending), Dade Co., Halifax, Hillsborough Co., Leon Co., Manatee Co., Orange Co., Pensacola, Pinellas Co., Sarasota, Lake Co.

**Illinois:** Chicago, Decatur, Des Plaines, Joliet, LaGrange Park, Lake Co., Du Page Co.

**Indiana:** Vanderburgh Co., Marion Co., St. Joseph Co., Wayne Co., Hammond.

**Iowa:** Cedar Rapids.

**Kansas:** Olathe, Scott Co., Kingman Co., Topeka/Shawnee Area, Pittsburg, Kansas City/Wyandotte Co., Halstead, Wichita/Sedgwick Co., Marysville, Clay Co.

**Maine:** Augusta, Bangor, Arrostook Co., Androscoggin Co., Oxford Co.

**Maryland:** Baltimore, Harford Co., Cecil Co., Prince George Co. (Pending), Montgomery, Anne Arundel.

**Massachusetts:** Abington, Acton, Arlington, Belmont, Beverly, Boston, Brookline, Cambridge (Pending), Chicopee, Danvers, Dedham, Dover, Easton, Fairhaven, Haverhill, Holyoke, Leominster, Lexington, Malden, Needham, New Bedford, Newburyport, Newton, Norfolk, Norton, Norwell, Petersham, Scituate, Wakefield, Waltham, Watertown, Wellesley, Westfield, Worcester.

**Minnesota:** Duluth, Minneapolis, St. Paul.

**Mississippi:** Jackson.

**Missouri:** Independence, Springfield, St. Joseph.

**New Hampshire:** Portsmouth.

**New Jersey State:** State Area 1, Bergen & Passaic Co.; State Area 2, Hudson Co.; State Area 3, Essex Co.; State Area 4, Union City; State Area 5, Sussex and Morris; State Area 6, Warren, Hunterdon & Somerset; State Area 7, Middlesex; State Area 8, Mercer; State Area 9, Monmouth & Areas; Burlington; Camden & Gloucester; Atlantic & Cape May; Salem & Cumberland.

**New Mexico:** Albuquerque.

**New York:** Albany Co., Allegany Co., Broome Co., Cayuga Co., Chemung Co., Clinton Co., Columbia Co., Cortland Co., Delaware Co., Dutchess Co., Erie Co., Franklin Co., Greene Co., Herkimer Co., Ithaca, Jamestown, Jefferson Co., Lewis Co., Livingston Co., Madison Co., Monroe Co., Montgomery Co., Mount Vernon, Nassau Co., New Rochelle, New York, Niagara Co., Niagara Falls, Ogdensburg, Olean, Oneida Co., Onondaga Co., Orange Co., Orleans Co., Oswego Co., Otsego Co., Peekskill, Port Jervis, Putnam Co., Rome, Rensselaer (city), Rensselaer (county), Rockland Co., Rye, Saratoga Co., Schenectady Co., Schoharie Co., Seneca Co., Steuben Co., Suffolk Co., Sullivan Co., Tompkins Co., Ulster Co., Utica, Warren Co., Washington Co., Wayne Co., Westchester Co., White Plains, Yates Co.

**Ohio:** Barberton, Canton, Cleveland, Jefferson Co., Lucas Co., Montgomery Co., Columbus, Ross Co., Van Wert, Youngstown.

**Oklahoma:** Tulsa.

**Oregon:** Baker Co., Benton Co., Deschutes, Jackson Co., Josephine Co., Lane Co., Linn Co., Marion Co., Portland, Umatilla Co., Washington Co., Yamhill Co.

**Pennsylvania:** Butler Co., Centre Co., Cumberland, Delaware Co., Philadelphia.

**Rhode Island:** Bristol, Coventry, Cranston, Portsmouth, Warren.

**Tennessee:** Chattanooga, Knoxville, Memphis, Nashville, Weakley.

**Texas:** Dallas Co., Fort Worth, Galveston Co., Houston, Paris, Wichita Falls.

**Utah:** Provo City, Salt Lake City, Utah Co.

**Virginia:** Hampton, London Co., Norfolk, Northern Region, Richmond, Roanoke.

**Washington:** Chelan Co., Clallam Co., Clark Co., Cowitz Co., Douglas Co., Franklin Co., Garfield Co., Grant Co., Grays Harbor, King Co., Kitsap Co., Okanogan Co., Pacific Co., Pierce Co., Seattle, Snohomish Co., Spokane Co., Tacoma, Thurston Co., Yakima Co.

**Wisconsin:** Madison, Milwaukee.

Let us know of any inaccuracies in the above lists, so they can be corrected on both our and FCDA's listings.

*Ready for the Simulated Emergency Test, October 8th-9th? See announcement elsewhere in this issue.*

## PREVIEW — 1955 FIELD DAY

Shown below are high claimed scores reported for the Nineteenth ARRL Field Day, held the week end of June 25th and 26th. These are subject to checking and grouping according to the number of transmitters in simultaneous use at each station. Complete FD results will appear in a later issue of QST.

### CLASS A — Portable Clubs and Groups

(Listings show call used in FD, claimed score, and number of simultaneously-operated transmitters.)

BPL medallions (see Aug. 1954 QST, p. 64) have been awarded to the following amateurs since last month's listing: K4AKP, W4DDY, K4WBG, W5DTA/5, W5KPB, W9YWL.

The BPL is open to all amateurs in the United States, Canada, Cuba, and U. S. possessions who report to their SCM a message total of 500 or more, or 100 or more originations-plus-deliveries for any calendar month. All messages must be handled on amateur frequencies, within 48 hours of receipt, in standard ARRL form.

## TRAFFIC TOPICS

It is entirely inevitable that we continue to regard traffic activity on the amateur bands in terms of "seasons" rather than calendar years. Not only is this a result of habit, because we've always done it that way and years ago nearly all traffic activity was suspended in May until October, but also of the necessity of taking into account the fact that most traffic men handle traffic because they enjoy it — and they don't enjoy it in the summer, with heat, insects, QRN and diversions occasioned by vacations and other invitations to the great out-of-doors.

Since the advent of NTS, however, and the tendency in other traffic circles as well to keep the traffic moving all year around, the aspect of "seasons" of traffic handling has been less noticeable. Oh, activity still drops off in summertime, and network organization goes all the way to when people start legal clock-changing, but you'll notice that the BPL is far larger by comparison during the summer months than it used to be, say, in 1936. For example, in December of 1935 we had 109 BPLs, but the following August only nine — this, mind you, during the lush traffic years when traffic handling was described (by Clinton B. DeSoto) as the "major activity" in amateur radio. Compare this with the BPL total of 114 in December of 1953 and 85 in August of 1954. Our summertime traffic activity, these days, is equal to some of the lower-yielding winter traffic months.

This is as it should be. If we are going to have a functioning traffic organization, it should function all year around. If training is one of the most important objectives in our traffic work (and we think it is), training in handling traffic under unfavorable conditions is one of the best kinds, if not the best kind. Why? Because most training is conducted under favorable conditions, causing almost complete breakdown when the trainee is faced with difficulties.

We have no quarrel with "fair weather" traffic men. In fact, we're mighty glad to have them working in the system during the good radio months. All we're saying is that the boys who stick with it all summer are getting the greatest benefit and doing the greatest good. And now that the fall operating season is on us again, let's make this the greatest traffic year yet.

**HAVE YOU REGISTERED YOUR NET?** If not, better do it if you want it in the annual Net Directory. Deadline for November QST listing was September 15; for January QST listing, November 15. For the cross-indexed net directory, December 1. See Traffic Topics in September QST for details on how to register.

Traffic nets will have a part to play in the Simulated Emergency Test, October 8th-9th. This is an ideal activity with which to pry the lid off the so-called fall operating season. See complete announcement elsewhere in this issue of QST.

The First Call Area Section of the Transcontinental Phone Net registered 614 message counts with 14 stations participating in July. During June, the message total was 400 by 8 stations. The Second Call Area Section reports 608 messages by 12 stations in July, 786 messages by 12 stations in June. This info by WLYL.

**National Traffic System.** As of this writing, the Eastern Area Net of NTS can handle traffic addressed to APO New York City. This is handled by a corps of stations organized by W2JOA who report into EAN for that purpose each night. The traffic is handled via MARS circuits, not by amateur radio. Stations participating are W2JOA, K2JEB, K2AEQ and W3WG. If you have traffic for APO New York, it can be routed to EAN through normal NTS channels.

Traffic for APO San Francisco (or other Pacific points) is an assignment of the Sixth Regional Net and should be routed through PAN to RN6. APO Seattle is similarly handled by RN7.

Of course we can't guarantee that these routings won't be changed by the time you read this!

July reports:

Net	Sections	Traffic	Rate	Average	Representation
EAN	19	508	1.16	26.7	—
PAN	27	431	0.15	15.9	100%

WVN (June)	13	79			

It appears that one of the hardest things for net managers to do is get their reports in here on time. This isn't always their fault, after all, they have to get QNS reports from NCS before they can make out a report, simple as it is after that. So this is a plea to NTS Net Control Stations at all levels: *report to your net manager promptly* after you control a net session, whether you are the regular control or not. Failure to do so results in a delayed report (which may then miss its proper issue of QST), or an incomplete report which prevents us from indicating the true status of NTS. NCS: *report to net manager promptly! Net Managers: Get reports into headquarters not later than the fifteenth of each month!*

Despite the "summer slump," only two regional nets and one area net failed to report, and fifteen section-level nets reported. Traffic is low, but organizational morale is high. RN5 reports a sharp decrease in traffic with cessation of traffic from MARS sources; K4AKP has been most consistent station during July. RN6 certificates have been awarded to K6GID, W6TTX, and K6EVM. July RN7 representation has been nil from Wyoming, Montana, Saskatchewan, Alberta and Alaska. W4KKW submits his first report as 9RN manager. W0KLG submitted the July TEN report for W0DQL. VE3GI reports that Maritime representation is badly needed on TRN.

In TCC, W0KQD will take over the TCC Pacific Area directorship being vacated by W6HC at the end of September. W9JUL will continue with the Central Area directorship and W8UPB with Eastern Area. The present roster, according to latest info from TCC directors: *Eastern Area:* W1EMG W1AW W1NJM W3COK W4OCG W4ZFW W8DSX W8FYO W8MQQ VE3AJR VE3BJV VE3GI VE3TM VE3VZ, *Central Area:* W0BDR and W8SCA; *Pacific Area:* W6ADB W6IPW K6BDF/7, W7CCL W7KZ K8ANZ/6 K0WBB W0KQD.

## W1AW OPERATING NOTE

The W1AW operating schedule, as shown on page 70, May QST, and page 70, September QST, will be maintained through October 29th. The W1AW fall schedule, effective Oct. 30th with return to EST, will be in November QST.

## ELECTION RESULTS

Valid petitions nominating a single candidate as Section Manager were filed by members in the following Sections, completing their election in accordance with regular League policy, each term of office starting on the date given.

San Joaquin Valley	Ralph Saroyan, W6JPU	June 15, 1955
West Virginia	Albert H. Hix, W8PQQ	Sept. 18, 1955
San Diego	Don Stansifer, W6LRU	Oct. 15, 1955
Vermont	Robert L. Scott, W1RNA	Oct. 15, 1955

In the Wyoming Section of the Rocky Mountain Division, Mr. Wallace J. Ritter, W7PKX, and Mr. Oscar Younglund, W7NVX, were nominated. Mr. Ritter received 46 votes and Mr. Younglund received 25 votes. Mr. Ritter's term of office began July 11, 1955.

In the Eastern Florida Section of the Southeastern Division, Mr. Arthur H. Benzee, W4FE, and Mr. John W. Hollister, W4FWZ, were nominated. Mr. Benzee received 182 votes and Mr. Hollister received 178 votes. Mr. Benzee's term of office began Aug. 14, 1955.

In the Southern New Jersey Section of the Atlantic Division Mr. Herbert C. Brooks, K2BG, and Mr. Edward G. Raser, W2ZI, were nominated. Mr. Brooks, received 151 votes and Mr. Raser received 105 votes. Mr. Brooks' term of office began Aug. 26, 1955.

## A.R.R.L. ACTIVITIES CALENDAR

Oct. 7th: CP Qualifying Run — W6OWP  
Oct. 8th-9th: Simulated Emergency Test  
Oct. 13th: CP Qualifying Run — W1AW  
Oct. 15th-16th: CD QSO Party (c.w.)  
Oct. 22nd-23rd: CD QSO Party (phone)  
Nov. 5th: CP Qualifying Run — W6OWP  
Nov. 12th-13th, 19th-20th: Sweepstakes  
Nov. 18th: CP Qualifying Run — W1AW  
Dec. 2nd: CP Qualifying Run — W6OWP  
Dec. 12th: Qualifying Run — W1AW  
Jan. 7th: CP Qualifying Run — W6OWP  
Jan. 7th-8th: V.H.F. Sweepstakes  
Jan. 14th-15th: CD QSO Party (c.w.)  
Jan. 21st-22nd: CD QSO Party (phone)

## ELECTION NOTICE

(To all ARRL members residing in the Sections listed below.)

You are hereby notified that an election for Section Communications Manager is about to be held in your respective Section. This notice supersedes previous notices.

Nominating petitions are solicited. The signatures of five or more ARRL full members of the Section concerned, in good standing, are required on each petition. No member shall sign more than one petition.

Each candidate for Section Communications Manager must have been a licensed amateur for at least two years and similarly a full member of the League for at least one continuous year immediately prior to his nomination.

Petitions must be in West Hartford, Conn., on or before noon on the closing dates specified. In cases where no valid nominating petitions were received in response to previous notices, the closing dates are set ahead to the dates given herewith. The complete name, address, and station call of the candidate should be included with the petition. It is advisable that eight or ten full-member signatures be obtained, since on checking names against Headquarters files, with no time to return invalid petitions for additions, a petition may be found invalid by reason of expiring memberships, individual signers uncertain or ignorant of their membership status, etc.

The following nomination form is suggested: (Signers will please add city and street addresses to facilitate checking membership.)

Communications Manager, ARRL. [place and date]  
38 La Salle Road, West Hartford, Conn.

We, the undersigned full members of the.....  
.....ARRL Section of the.....  
Division, hereby nominate.....  
as candidate for Section Communications Manager for this Section for the next two-year term of office.

Elections will take place immediately after the closing dates specified for receipt of nominating petitions. The ballots mailed from Headquarters to full members will list in alphabetical sequence the names of all eligible candidates.

You are urged to take the initiative and file nominating petitions immediately. This is your opportunity to put the man of your choice in office.

— F. E. Handy, Communications Manager

Section	Closing Date	SCM	Present Term Ends
Yukon *	Oct. 14, 1955	W. R. Williamson	Mar. 17, 1949
West Indies	Oct. 14, 1955	William Werner	Aug. 15, 1952
Utah	Oct. 14, 1955	Floyd L. Hinshaw	Feb. 18, 1954
South Carolina	Oct. 14, 1955	T. Hunter Wood	Oct. 15, 1955
Western Florida	Oct. 14, 1955	Edward J. Collins	Oct. 15, 1955
East Bay	Oct. 14, 1955	Guy Black	Resigned
Eastern New York	Oct. 14, 1955	Stephen J. Neason	Dec. 14, 1955
Ohio	Oct. 14, 1955	John E. Siringer	Dec. 14, 1955
Alabama	Oct. 14, 1955	Joe A. Shannon	Dec. 14, 1955
Quebec *	Oct. 14, 1955	Gordon A. Lynn	Dec. 15, 1955
Illinois	Oct. 14, 1955	George T. Schreiber	Dec. 15, 1955
Alaska	Nov. 15, 1955	Dave A. Fulton	Jan. 15, 1956
Virginia	Dec. 15, 1955	John Carl Morgan	Feb. 11, 1956
Oklahoma	Dec. 15, 1955	Dr. Will G. Crandall	Feb. 15, 1956
Maritime *	Dec. 15, 1955	Douglas C. Johnson	Feb. 15, 1956
Georgia	Jan. 16, 1956	George W. Parker	Mar. 18, 1956

\*In Canadian Sections nominating petitions for Section Managers must be addressed to Canadian Director Alex Reid, 169 Logan Ave., St. Lambert, Quebec. To be valid, petitions must be filed with him on or before closing dates named.

## CODE PROFICIENCY PROGRAM

Twice each month special transmissions are made to enable you to qualify for the ARRL Code Proficiency Certificate. The next qualifying run from W1AW will be made on October 13th at 2130 EDST. Identical texts will be sent simultaneously by automatic transmitters on 1885, 3555, 7125, 14,100, 21,010, 52,000 and 145,600 kc. The next qualifying run from W6OWP only will be transmitted on October 7th at 2100 PDST on 3590 and 7138 kc.

Any person may apply; neither ARRL membership nor an amateur license is required. Send copies of all qualifying runs to ARRL for grading, stating the call of the station you

copyied. If you qualify at one of the six speeds transmitted, 10 through 35 w.p.m., you will receive a certificate. If your initial qualification is for a speed below 35 w.p.m., you may try later for endorsement stickers.

Code-practice transmissions will be made from W1AW each evening at 2130 EDST. Speeds are 15, 20, 25, 30 and 35 w.p.m. on Monday, Wednesday and Friday, and 5, 7½, 10 and 13 w.p.m. on Sunday, Tuesday, Thursday and Saturday. Approximately 10 minutes' practice is given at each speed. References to texts used on several of the transmissions are given below. These make it possible to check your copy. For practice purposes, the order of words in each line of QST text sometimes is reversed. To get sending practice, hook up your own key and buzzer and attempt to send in unison with W1AW.

Date	Subject of Practice Text from August QST
Oct. 4th:	An Improved Antenna Bridge, p. 11
Oct. 6th:	The Transistorized "Little Gem," p. 16
Oct. 10th:	807s in Parallel, p. 18
Oct. 12th:	One Tube — 80 and 40 Meters . . . , p. 26
Oct. 14th:	Portable Antennas for 50 and 144 Mc., p. 29
Oct. 18th:	The Automobile Storage Battery . . . , p. 32
Oct. 20th:	A Six-Meter Club Project, p. 37
Oct. 25th:	A.R.R.L. at Operation Cue, p. 45
Oct. 28th:	The World Above 60 Mc., p. 55

## JULY CD QSO PARTIES

Among the highlights in July: 00 W6MUR claims a record 68 sections worked on c.w. (all but VE4, VE5, VE6, KL7 and KZ5), and ORS W3DGM, a long-time brasspounder and contest enthusiast, took microphone in hand to pace the 'phone gang.

Listed below are the highest claimed scores. Figures after each call indicate score, number of contacts, and number of ARRL sections worked. Final and complete results will appear in the October CD Bulletin.

<sup>1</sup> W1WPR, opr.    <sup>2</sup> W9VYF, opr.

After making 330 c.w. QSOs at W1AW, statistics-minded W1WPR sat down and did some figuring on the distribution of appointments. There were 273 stations worked once, 78 two-banders, 14 three-banders, and one four-bander. Here's the way the 273 different broke down: ORS 138, 00 47, EC 24, RM 18, OBS 13, OPS 7, Asst. Director 5, SCM 5, Director 4, PAM 3, OES 2, Headquarters 2, Vice-Director 2, QSL Manager 2, SEC 1. Since those holding more than one appointment can pick any one of several to identify themselves, the figures must be taken with a pinch of salt. Apparently, however, in a c.w. CD Party more than half your contacts will say "HR ORS."

• All operating amateurs are invited to report to the SCM on the first of each month, covering station activities for the preceding month. Radio Club news is also desired by SCMs for inclusion in these columns. The addresses of all SCMs will be found on page 6.

## ATLANTIC DIVISION

**EASTERN PENNSYLVANIA** — SCM, Clarence Snyder, W3PYF — SEC: NNT, RM: AXA, PAM: TEJ, E. Pa. nets: 3850 and 3610 kc. ZRQ has a new 300-watt rig. NNV reports his son, AQL, was home for a visit from Lowery AFB. His other son, AQM, just made his first contact on 2 meters. FPC just passed his 20th year of having the same call and living at the same QTH. FPC invites interested amateurs to visit South Philadelphia Amateur Radio Club every Tue. night at 17th and Tasker. ZSH is back from a vacation in W9-Land. BIP is back on the air with a new shack. TEJ, E. Pa. PAM, is lining up liaison for the PFN to other nets for the coming season. LJ, act. mgr. for YDX, reports the heat and vacations caused traffic to drop off at that QTH. CBZ, the Reverend Paul Sheffer, Lutheran pastor at Ferndale Lutheran Parish, is a new amateur. He is on the air now with a new Viking Adventurer and formerly was licensed under the call 3ARP in York around 1938. The new club at Levittown has adopted the name Windsor ARC. Officers are NME, pres.; QHF, vice-pres.; and WUY, secy.-treas. The Club holds code and theory classes every Mon. at the Youth Center in the Holly Hill section of Levittown. Meetings are held at the same place the first Wed. of every month. MAC and the Delaware River Net meet regularly on 3910 kc. at 9:15 Mon. through Fri. Invitation is issued for applications for ARRL appointments as EC, OO, OPS, ORS, OES, and OBS. A card to your SCM will bring details. AZZ, of Wormleysburg, advises that he now is stationed in Germany and operating under the call DL4PR with a Globe King. He is looking for 20-meter contacts with the gang around Harrisburg. WUE now is asst. mgr. of the Interstate Phone Net. BES missed Field Day for the first time since its inception because of his wedding anniversary. RSC is off the air while moving to a new QTH. WN3CKP is operating airborne mobile on 145,360 Mc. WJY spent the month of July operating portable at Lake Harmony. Traffic: W3CUL 1048, YDX 221, TEJ 173, BIF 100, WUE 99, BUR 85, OK 85, GIY 61, YAZ 61, TSY 60, BNR 51, PYY 29, DUI 22, BIP 18, PYF 14, ELI 12, UOE 6, YVX 6, ZRQ 6, BES 3, BGA 3, OML 2.

**MARYLAND-DELAWARE-DISTRICT OF COLUMBIA** — SCM, John W. Gore, W3PRL — The MEPN held its fourth annual picnic at Gambrills State Park near Frederick, Md., on Sun., July 24th. Among the 384 present were George Hart, 1N1M, ARRL National Emergency Coordinator, and Gil Crossley, 3YA, Atlantic Division Director. Mobiles were talked in to the mountain top on 2, 6, and 10 meters. A short mid-day shower was tolerated by the 384 present and soon forgotten in the day's activities. Liz, CDQ, found time to attend the picnic as well as the YLRL Convention at Santa Monica. Dr. Willis C. Gore, of the Johns Hopkins faculty, gave a talk and demonstration on "Parasitic Beams" at the July 11th meeting of the CARC. Leo Hruska gave a talk and demonstration on "No B Auto Convertors for Short Waves" at the July 25th meeting. The ARRL film "Standing Waves" was shown at the July 5th meeting of the Antietam Radio Assn. of Hagerstown. At the July 19th meeting of the ARA the club's equipment console building project was started. WN3CVC has joined the fraternity with a Johnson Adventurer on 80 and 40 meters. KMA is working on his 80-, 40-, and 20-meter antennas. KMA also has completed a broad-band 144-Mc. convertor as per the *Handbook*, and found it to be the best he has used to date. RV, with 10 watts to a 2E26 on 6 meters, has worked 7 states including California. KTR has acquired a restful mountain cottage at 2500 ft. elevation in the Blue Ridge Mountains near Big Meadows, where in his spare time he operated portable with a TBS-50-C into a Windom. QCB finally worked 1AW after 6 years, during the CD Party July 16th. BUD has been appointed EC for St. Marys County. TRG received WAS in July. WV worked VQSAX and also worked UR3B for 3B's second contact after getting settled. WAF worked his first Baffin Island station. Traffic: (July) W3WG 1383, WV 508, UCR 197, RV 63, PRL 62, COK 32, BUD 26, PKC 26, KMA 15,

OYX 6, WAF 6, TBG 4, CDG 2. (June) K3WBJ 404, W3CVC 383, COK 67, PKC 56, KMA 10, WKB 2.

**SOUTHERN NEW JERSEY** — SCM, Herbert C. Brooks, K2BG — SEC: W2ZVW, PAM: ZI, I am very grateful for the support that I received in the recent balloting which resulted in my reelection. KTR has been appointed ORS and BZJ recently moved to Pennington. Welcome to the section, Walt. RG continues to do a fine job of handling traffic and is NCS of two c.d. drills each Sun. K2CPR made over 41,000 points in the recent CD Party. K2HZR has a new receiver and is keeping regular traffic skeds. ZI has a traffic sked with the YMCA Boys' Camp at Camp Wilson, N. J. After a very successful Field Day, SJRA is making plans for the Field Net. The SJRA DX editor, SDB, gives lots of encouragement to the DX aspirants of the Club. The Burlington County Radio Club continues its regular weekly drills alternating between the club station, K2KED, and the area c.d. station. No doubt because of vacations, we have nothing to report from the Tri-City Amateur RC or from the SCARA. DVRA News keeps its members well informed by reprinting the Official Bulletins. K2ITP and ITQ are operating 2, 20, and 40 meters, and working hard for that WAS ticket. K2JKA is manager of the Stag Net on 3890 kc. Mon. through Fri. at 0900 EDT. ECs are needed in the southern counties to coordinate the available emergency facilities. Please contact your SCM or SEC. Traffic: (July) K2JKA 184, W2RG 166, K2HZR 138, W2HDV 25, ZI 9, K2CPR 2, (June) W2YRW 47.

**WESTERN NEW YORK** — SCM, Edward G. Graf, W2SJV — Asst. SCM: Jeanne Walker, 2BTB, SEC: UTH/ PRL, RM: RUF, PAMs: TEP and NAI. NYS meets on 3615 at 6 p.m. and 6:30 a.m.; NYSS on 3595 at 5:30 p.m.; NYSR on 3595 at 8 p.m.; NYS on 3925 at 6 p.m.; NYS C.D. on 3509.5 and 3993 at 9 a.m. Sun.; TCNP 2nd Call Area on 3970 at 7 p.m.; SRPN on 3980 at 10 a.m.; ISPN on 3870 at 3 p.m.; LCP Mobile on 2; Niagara Mobile Net on each Sun. at 11 a.m. on 3885 kc. KN2MMB is owner of a taxi company with ham gear installed. CFJ renewed as EC for Jefferson County. Officers of the Syracuse V.H.F. Club are RBK, pres.; HNH, vice-pres.; JMI, secy.-treas.; RHQ, act. mgr. Many of the group are getting on 6 meters, with new stations as follows: K2JIM, GEI, EPH, and KN2LXN. The new club participated in the V.H.F. SS and Field Day. K2EVJ is operating the high school club transmitter at K2KHB. A very nice article on c.d. by PPY, Erie County EC, appears in Aug. QST. K2DYB has been appointed OO. K2DYC is active on 50.4 Mc. between 1900 and 2100. RSV is active from the Colton Area. An ARATS meeting was devoted to c.d. demonstration, instructing Novices in a practice drill. The Elmira ARA meeting at the club shack turned into a weiner roast and inspection of the club's new 20-meter beam. Sydney, Binghamton, and IBM Clubs held a picnic at Perch Pond with a transmitter hunt. UJS held a program chairman. ZOL vacationed in New England. DLB dropped the "N" from his call. TXS operates TV and radio business and ham radio from the same room in his home with no TVI. SHZ and CYV are mobile on 10 meters. CVX and JVZ are revamping mobile gear for new cars. K2HVZ is visiting KN2INP. ZRC made Extra Class. MSJ is going to Roch. Tech. JGJ is on 6 meters. The Federal-State Flood Forecasting Service has had the cooperation of the URN and RVN Nets in getting valuable WX information into the nets once a month. Stations in the vicinity of Olean are needed to give better coverage. It would be a nice gesture if at least two stations from this vicinity in W.N.Y. could lend a hand once a month on 3585 at 9:30 p.m. Write or send a message to 3UVD for further details. QQ vacationed in VE3-Land. ZOL and CTQ were active in the Powder Puff Derby. SHZ finds the transmitter works better with just one side of the mike cable grounded. HXG renewed as Seneca Co. EC. YPW renewed as ORS. DJH moved to Warrensburg. KN2MZR and MZP are on the air. NYSR, New York Restricted Speed Net, is operating at 1800 on 3595 kc. with K2CLA as mgr. and K2CQO asst. mgr. UKQ's operating time is confined to c.d. RZF renewed as Delaware Co. EC. UTH renewed as OES. K2CEH has a three-element beam on 6 meters. K2DUO had an amateur radio station at Lafayette Theatre for a demonstration. Traffic: (July) W2URF 345, YGW 145, ZRC 145, BXP 108, BNC 101, QHH 49, K2AMZ 48, W2ZLT 44, K2DSR 26, W2RQF 16, DSS 15, EMW 10, RUT 3, K2GAL 2, W2MYN 2. (June) W2RQF 19, K2DG 18, (May) W2RQF 11.

**WESTERN PENNSYLVANIA** — SCM, R. M. Heck, W3NCD — SEC: GEG, RMs: UHN, NRE, and NUG. PAMs: AER and LXE/VKD. The Mercer County Radio Association recently held its annual picnic. Originally

scheduled for the local park, it was held in the evening at the residence of SYZ because of quite a bit of dampness. However, it was well attended and an enjoyable affair. The Breeze Shooters Net meets on 29 Mc. each Mon. at 8. BSN also reports officers for the coming year are SJK, pres.; QYF, checker; TTR (YL, secy.; and PII, SIR, and TDC, directors. SJK says that several persons have gotten tickets, thanks to BSN's Mon. code practice. UJP found much of his signal diverted to ground through his adjustable low-pass filter and advises users of same to check adjustment of them. KLP has a transistor receiver and one audio stage of his transmitter and also uses one. RUZ now has a 101X. WHA and KPS are recent volunteers as NCS. BSN now numbers about 251 local ground-wave members. The Radio Association of Erie boys held a hidden transmitter hunt, with MED putting out the signal and YKE, TMK, LKJ, STK, QN, and TLA tracking him down. The Annual Hamquet was observed and attended by a fine crowd. VNC is looking for an HT-18. MNP has erected a beautiful new tower for his 10- and 20-meter beams. The South Hills Brass Pounders and Modulators August Hamfest was held on schedule and was well attended. Everyone had a fine time even though a heavy rain came in at about the middle of the activities. WIQ, consistently BPL, has been vacationing in Florida. Traffic: (July) W3WVQ 697, YA 48, ZEW 37, ZEG 30, SIJ 16, UHN 9, KNQ 6.

## CENTRAL DIVISION

**ILLINOIS** — SCM, George T. Schreiber, W9YIX — Section Nets: ILN 3515 kc.; IEN 3940 kc. SEC: HOA. RMs: BUK and MRQ. PAM: UQT. Cook County EC: HPG. News has been very scarce this month. Have you chaps been neglecting to send it in, or have you just been fishing? Members of the Knox-Warren Radio Assn. furnished communications July 4th to the Galesburg emergency police doing automobile traffic duty. VSX/9 was base station. CLH likes his new 20-meter three-element beam and keeps the QSL Bureau busy. EOL is back on 40 meters with a vertical, having returned to the section from Iowa. RMI will be out of the Navy soon and will have a new QTH in Peoria. Hope he checks into the ILN, they need him in that vicinity. FNX is chasing DX with his new Ranger. A new Technician heard is ICW. OEV does well with 100 watts on 2 meters. HMM has moved to Sycamore. The Quad City Club has bought a bus and the membership, under the leadership of ONX, the local EC, is busy overhauling it and installing radio gear. 6LPK writes to tell the fellows they are talking to VTO, formerly of Western Springs, when they contact him on 80 meters. BA, with much help from ATU, UWP, TCX, NPM, and EWU, furnished a complete communications system for the Southern Illinois Sports Car Club hill climb on July 17th. The St. Clair Amateur Club has identification buttons 3½ inches in diameter so the members can "see" who is at the meeting. 8WKH now is K9AVC at Scott AFB. KTH threatens to be back on the air any day now. DO picked up his 17th BPL certificate. ICF has so much new equipment that it would take the entire column to tell about it. He likes his new 160-meter Windom. SHM spent six months in KH6-Land but reports there is no place like home. UGG and UGR have moved to Davenport. CMR is trying out single sideband. KDX received his engineering degree upon June graduation. Congratulations to AOB, who got married. The Central Illinois Radio Amateur Club picnic was a honey. Flowers to the *Oscillator*, the bulletin of the Tri-Town Radio Amateurs Club, on the excellent Field Day number. The editor is OQN. EVA introduced YL 7QYA to the telegraph gang at KSB 47, the Chicago Police sta-

tion, and she astonished all, even Director UQT, by slipping in and copying the circuit. BII has built a Globe Scout with 155-volt mains and a vibrator supply for mobile use in his car. The Kankakee Amateur Radio Club staged a hidden transmitter hunt on July 30th. First place was taken by LCH, with TBU second. KLD hid the transmitter. CWH passed the Extra Class exam. Vice-Director QIZ won nine fishing lures and EU a deep fryer at the QCWA picnic. Now they have teamed up, QIZ to catch the fish and EU to fry 'em. Route Manager BUK's tower buckled in the middle when he raised it after trying to install a 2-meter beam. A new call heard on ILN is KMZ. GAS built a new Ranger. HPJ ran a commercial communication set-up for the National Conference of Governors held in Chicago and introduced several of them to ham radio. Traffic: (July) W9DO 1283, OFR/9 633, YYG 191, OR 116, CSW 93, VHD 54, YIX 48, IDA 47, VSX 36, CTZ 25, BUK 24, SME 21, BII 19, LRV 19, LXJ 17, EHS 12, SXL 12, BA 11, CEE 11, CZB 10, MRQ 9, CLH 8, VER 8, JMG 4, PHE 3, FNX 2, KLD 1. (June) W9IDA 367, USI 46, HPG 33, VSX 16, FRP 4.

**INDIANA** — SCM, George H. Graue, W9BKJ — This report is being compiled by BEM, Allen County EC, while our SCM is vacationing in Michigan. FMJ and BKJ operated mobile and portable /8 and kept daily schedule with both section nets. AQR is having receiver trouble. IOP lost some of his equipment in an electrical storm. NZZ still is moving traffic into the Arctic despite terrific temperatures. CAEN had 20 sessions and a traffic total of 50, as reported by EHZ. NTA reported 52 sessions and a traffic total of 254 for IFN. VSH received an A-1 Operator certificate. N9FJN, POS, KDH, and KDW passed the General Class exam. BEM has a three-element quad working fine. JFJ has a new Ranger. UHV is active on 50 Mc. DQI is a CAP cadet. MZE, ex-DL4CT, expects to attend Indiana Tech. in Ft. Wayne this fall. N9RVV is organizing a Novice net in the southern part of the State. OG is new in Evansville; also N9AMT and YZJ. DGA is vacationing in the Smokies and will visit South Carolina for his 48th state. ZZA is 6-meter mobile and is vacationing in Yellowstone Park. YRF has changed to a pair of 812s. The IRCC Field Day plaque was won by the Michiana Radio Club station, AB/9. Omission in last month's report was the Field Day message from LIT/9 to the SCM. MUR has resigned as EC for Wayne County and has been replaced by GOS. 6AMU is new at Bunker Hill AFB. DOK is moving his shack into the basement. CC is putting up a 10-meter close-spaced beam. The only BPL for the month is NZZ. No report has been received from Peggy, JUJ, for the third consecutive month. Traffic: W9NZZ 1334, T2 293, UQP 140, EHZ 136, WRO 113, ZYK 97, NTA 91, TQC 75, ZRP 36, BKJ 35, CMT 35, ZIB 21, CTF 15, DOK 14, GDL 11, STC 9, AQR 8, BDP 6, QR 6, FGX 5, FJS 5, PPS 5, CC 4, DGA 4, HSG 3, EQO 2, NH 2, VNE 2, AYD 1.

**WISCONSIN** — SCM, Reno W. Goetsch, W9RQM — SEC: OVO. PAMs: ESJ and GMY. RMs: IXA and RTP. Nets: WIN, 3685 kc., 7 p.m. daily; BEN, 3950 kc., 6 p.m. daily; WPN, 3950 kc., 1215 Mon.-Sat., 0930 Sun. Wisconsin mobile and c.d. frequency: 29,620 kc. KQB has new SX-96 and plans a 40-meter vertical and a coax-fed dipole on 80 meters for antennas. WN9NOD is new in West Bend. RQK is having FB results with 15-watt mobile on 75 and 10 meters. KHR is running 40 watts to a 6BQ6 final and has a Super Pro receiver. JEF won the Green Bay Mike & Key Club 40 meter contest with 187 cards in 2 months. UTV got tangled up with 6UTV during the CD Party on the same frequency. DIK made 45,175 points in the CD Party. SZR sends his report from Seattle, Wash., while on vacation. The NWRC held its annual picnic July 24th at Brunet Park, Cornell. KN9ASH, KN9AQS, and KN9AQT are new calls at Wausau. UOI mobilized to Colorado. BXJ caught the s.s.b. bug from GRX. YOX is building a 60-watt mobile. SIE is on with a Ranger. FCB received his General Class ticket and will be going to U. of W. this fall. YOS and YOX will attend U. of W. Ext. in Milwaukee this fall. ITI has mobile in the car now. New certificates (WIN) were issued to YZA, IXA, CCO, BVG, PVN, KQB, and DAJ. Point Radio Amateurs furnished communications for the Lions Parade and American Legion Picnic. AJU reports WPN cleared 145 messages with 661 QNT in June. HEF and ZLD have new DX-100 transmitters. EFF joined the Air Force. HAH put up a 40-meter ground plane. WYE has a new three-element beam on 6 meters. ZDU has a new B&W 5100. VOD is going to a kw. UDK is building a dual 20- and 40-meter beam. KN9ASW has been operating ODD at Marquette U. HDV has been active on 14-Mc. s.s.b. UCO, OMT, and DWT are new members of the Green Bay 28-Mc. Net. OMT qualified for RCC. KXK received a QSL from FG7XB making 137 confirmed. A Wisconsin section meeting has been scheduled for 3 p.m. in connection with the Mancorad Fall Hamfest in Manitowoc Oct. 29th. Plan now to attend. Traffic: (July) W9KQB 91, SAA 58, BVG 32, RQK 20, YZA 20, RQM 13, KHR 11, JEF 10, RKP 9, DIK 7, FFC 7, OVO 7, UTV 7, CCO 6, GMY 6, SZR/9 6, AJU 2, TAL 1. (June) W9RTP 46, BVG 34, UIM 17, IXA 14.

(Continued on page 84)

## ILLINOIS QSO PARTY October 21-30, 1955

A state-wide contest, in which all Illinois amateurs are eligible to take part, will be held from 12:01 A.M. October 21st to 11:59 P.M. October 30th.

**Rules:** (1) Object is to QSO as many Illinois stations in as many of the 103 Illinois counties as possible.

(2) Only one contact with a given station may be counted unless the station moves to a different county.

(3) Any and all amateur bands and any mode of transmission may be used.

(4) A contact shall consist of the two-way exchange of signal reports and county names.

(5) Multiply the number of contacts by the number of Illinois counties worked to determine final score.

(6) Valid contest entries must list all stations worked together with their county locations and should be submitted to the Illinois SCM. They must be postmarked not later than November 15, 1955.

## About "S" Meters

**W**E ARE all familiar with the "S" meter calibration on communications receivers and know that indications on that meter present a measure as to the strength of signal being received in comparison with other signals. This is the basic purpose of the meter and in that function it serves well, but what about the calibration of that meter as far as its being a standard is concerned?

**A**LTHOUGH there are occasional departures, the standard S-unit interval has come to be established at about 6 db. If you dig into the subject a little further, you will come up with the fact that a signal indicating S-9 on one receiver will not necessarily be S-9 on another.

**T**HE "S" meter readings can be quite different even on identical receivers run off the same production line unless some special care is employed during manufacture. Actually, "S" meter readings between different makes of receivers are about as standard as a yard determined by the stride of a six foot man and a four foot man.

**B**ASICALLY an "S" meter is a current reading device connected in some point of the receiver circuit controlled by AVC where a change in received signal strength will cause a change in current flow. Whatever will affect that circuit will also affect the current readings.

**W**E AT Hallicrafters employ a 0-5 MA meter connected in series with the B+ to an RF or IF tube. This is a very effective circuit which will immediately indicate changes in plate current caused by a variation of AVC voltage at the grid of the tube according to the strength of the signal being received.

**I**F A conventional meter is used in this circuit, the meter calibrations would be somewhat confusing as they would be backwards. To avoid complex bridge network circuitry we simply purchase our "S" meter movements with the springs reversed, so with no current through the meter, the pointer rests at the right hand side of the scale.

**A**LTHOUGH all tube manufacturers fabricate tubes to certain industry standards, there still will be differences in the actual operating characteristics of each tube. Tolerances of tubes and other parts in the communications receiver may also be affected by aging and other conditions to which the receiver is subjected during its lifetime. Therefore, the "S" meter readings will be affected also.

**I**T IS obvious that with a poor antenna the signal strength on a given signal will be less than the same signal on a better antenna. Hence, an "S" meter report should be considered in view of the antenna used. To provide some standardization, we at Hallicrafters have assumed that a 50-microvolt signal at the antenna posts on the 80 meter band is an S-9 signal. To afford more versatility to the meter, on our large sets we also provide a second scale calibrated in microvolts. On certain larger receivers it is possible to hold this calibration fairly close throughout the tuning range. However, production variations in tube Gm preclude extreme accuracy in calibration and, therefore, don't consider your receiver as a Standard Field Strength Meter.

**A**GING of the receiver and resultant changes in component values and operating characteristics may affect the original factory set-up of the "S" meter, thereby making it impractical to use an "S" meter as a standard of measurement. But even though the "S" meter cannot be used as a measurement standard unless calibrated frequently from a local standard signal source, it is still an invaluable aid and helpful tool in the operation of an amateur radio station.

— Tony Dambrauskas, W9GXH

## Heathkit VFO KIT

MODEL VF-1

**\$1950**

Ship. Wt. 7 lbs.

Here is the new Heathkit VFO you have been waiting for. The perfect companion to the Heathkit Model AT-1 Transmitter. It has sufficient output to drive any multi-stage transmitter of modern design. A terrific combination of outstanding features at a low kit price. Good mechanical

and electrical design insures operating stability. Coils are wound on heavy duty ceramic forms, using Litz or double cellulose wire coated with polystyrene cement. Variable capacitor is of differential type construction, especially designed for maximum bandspread and features ceramic insulation and double bearings.

This kit is furnished with a carefully precalibrated dial which provides well over two feet of calibrated dial scale. Smooth acting vernier reduction drive insures easy tuning and zero beating. Power requirements 6.3 volts AC at .45 amperes and 250 volts DC at 15 mills. Just plug it into the power receptacle provided on the rear of the AT-1 Transmitter Kit. The VFO coaxial output cable terminates in plastic plug to fit standard 1/2" crystal holder. Construction is simple and wiring is easy.

- Smooth acting illuminated and precalibrated dial.
- 6AU6 electron coupled Clapp oscillator and OAZ voltage regulator.
- 10 Volt average output on fundamental frequencies.
- 7 Band calibration, 160 through 10 meters, from 3 basic oscillator frequencies.

Open layout,—easy to build—simplified wiring.

Smooth acting illuminated dial drive.

Clean appearance—rugged construction—accessible calibrating adjustments.

Ceramic coil forms—differential condenser.

Copper plated chassis—careful shielding.

## Heathkit AMATEUR TRANSMITTER KIT

MODEL AT-1

**\$2950**

Ship. Wt. 16 lbs.

### SPECIFICATIONS:

Range 80, 40, 20, 15, 11, 10 meters.  
6AG7 ..... Oscillator-multiplier.  
6L6 ..... Amplifier-doubler.  
5U4G ..... Rectifier.  
105-125 Volt A.C. 50-60 cycles 100 watts. Size: 8 1/4 inch high x 13 1/4 inch wide x 7 inch deep.

Crystal or VFO excitation.

Prewound coils—metered operation.

Rugged, clean construction.

Single knob band switching.

Built-in power supply.

52 ohm coaxial output.

Here is a major Heathkit addition to the Ham radio field, the AT-1 Transmitter Kit, incorporating many desirable design features at the lowest possible dollar-per-watts price. Panel mounted crystal socket, stand-by switch, key click filter, A. C. line filtering, good shielding, etc. VFO or crystal excitation—up to 35 watts input. Built-in power supply provides 425 volts at 100 MA. Amazingly low kit price includes all circuit components, tubes, cabinet, punched chassis, and detailed construction manual.

## Heathkit COMMUNICATIONS RECEIVER KIT

Four band operation 535 to 35 Mc.

Stable BFO oscillator circuit.

Six tube transformer operation.

Electrical bandspread and scale.

RF gain control with AVC or MVC.

5 1/2 inch PM Speaker. Headphone Jack.

Noise limiter—standby switch.

### SPECIFICATIONS:

Range.....535 Kc to 35 Mc  
12BE6 ..... Mixer-oscillator  
12BA6 ..... I. F. Amplifier  
12AV6 Detector AVC—audio  
12BA6 B. F. O. oscillator  
12A6 ..... Beam power output  
5Y3GT ..... Rectifier  
105-125 volts A.C. 50-60 cycles, 45 watts.

A new Heathkit AR-2 communications receiver. The ideal companion piece for the AT-1 Transmitter. Electrical bandspread scale for tuning and logging convenience. High gain miniature tubes and IF transformers for high sensitivity and good signal to noise ratio. Construct your own Communications Receiver at a very substantial saving. Supplied with all tubes, punched and formed sheet metal parts, speaker, circuit components, and detailed step-by-step construction manual.

MODEL AR-2

**\$2550**

Ship. Wt. 12 lbs.

### CABINET:

Proxylon impregnated fabric covered plywood cabinet. Shipp. weight 5 lbs. Number 91-10, \$4.50.

**HEATH COMPANY**  
BENTON HARBOR 9, MICHIGAN

## New HEATHKIT DX-100

MODEL DX-100

Shpg. Wt. 120 lbs.

**\$189.50**

Shipped motor freight unless  
otherwise specified. \$50.00  
deposit with C.O.D. orders.

- R.F. output 100 watts Phone, 125 watts CW.
- Built-in VFO, modulator, power supplies. Kit includes all components, tubes, cabinet and detailed construction manual.
- Crystal or VFO operation (crystals not included with kit).
- Pi network output, matches 50-600 ohms non-reactive load. Reduces harmonic output.
- Treated for TVI suppression by extensive shielding and filtering.
- Single knob bandswitching, 160 meters through 10 meters.
- Pre-punched chassis, well illustrated construction manual, high quality components used throughout—sturdy mechanical assembly.

## PHONE AND CW TRANSMITTER KIT

This modern-design Transmitter has its own VFO and plate-modulator built in to provide CW or phone operation from 160 meters through 10 meters. It is TVI suppressed, with all incoming and out-going circuits filtered, plenty of shielding, and strong metal cabinet with interlocking seams. Uses pi network interstage and output coupling. R.F. output 100 watts phone, . . . . . 125 watts CW. Switch-selection of VFO or 4 crystals (crystals not included).

Incorporates high quality features not expected at this price level. Copper plated chassis—wide-spaced tuning capacitors — excellent quality components throughout—illuminated VFO dial and meter face—remote socket for connection of external switch or control of an external antenna relay. Preformed wiring harness—concentric control shafts. Plenty of step-by-step instructions and pictorial diagrams.

All power supplies built-in. Covers 160, 80, 40, 20, 15, 11 and 10 meters with single-knob bandswitching. Panel meter reads Driver Ip Final Ig, Ip, and Ep, and Modulator Ip. Uses 6AU6 VFO, 12BY7 Xtal osc.-buffer, 5763 driver, and parallel 6146 final. 12AX7 speech amp., 12BY7 driver, push-pull 1625 modulators. Power supplies use 5V4 low voltage rect., 6AL5 bias rect., 0A2 VFO voltage reg., (2) 5R4GY hi voltage rect., and 6AQ5 clamp tube. R.F. output to coax. connector. Overall dimensions 20 $\frac{3}{4}$ " W x 13 $\frac{3}{4}$ " H x 16" D.

## Heathkit GRID DIP METER KIT

MODEL GD-1B

**\$19.50** Ship. Wt.  
4 lbs.

The invaluable Instrument for all Hams. Numerous applications such as pre-tuning, neutralization, locating parasites, correcting TVI, adjusting antennas, design procedures, etc. Receiver applications include measuring C, L and Q of components—determining RF circuit resonant frequencies.

Covers 80, 40, 20, 11, 10, 6, 2, and 1 $\frac{1}{2}$  meter Ham bands. Complete frequency coverage from 2—250 Mc, using ready-wound plug-in coils provided with the kit. Accessory coil kit, Part 341-A at \$3.00 extends low frequency range to 350 Kc. Dial correlation curves furnished.

Compact construction, one hand operation, AC transformer operated, variable sensitivity control, thumb wheel drive, and direct reading calibrations. Precalibrated dial with additional blank dials for individual calibration. You'll like the ready convenience and smart appearance of this kit with its baked enamel panel and crackle finish cabinet.

## Heathkit ANTENNA COUPLER KIT

MODEL AC-1

**\$14.50** Shpg. Wt.  
4 lbs.

Poor matching allows valuable communications energy to be lost. The Model AC-1 will properly match your low power transmitter to an end-fed long wire antenna. Also attenuates signals above 36 Mc, reducing TVI. 52 ohm coax. input—power up to 75 watts—10 through 80 meters—tapped inductor and variable condenser—neon RF indicator—copper plated chassis and high quality components.

## Heathkit ANTENNA IMPEDANCE METER KIT

MODEL  
AM-1

**\$14.50** Shpg. Wt.  
2 lbs.

Use the Model AM-1 in conjunction with a signal source for measuring antenna impedance, line matching purposes, adjustment of beam and mobile antennas, and to insure proper impedance match for optimum overall system operation. Will double, also, as a phone monitor or relative field strength indicator.

100  $\mu$ a. meter employed. Covers the range from 0 to 600 ohms. Cabinet is only 7" long, 2 $\frac{1}{4}$ " wide, and 3 $\frac{1}{4}$ " deep. An instrument of many uses for the amateur.

**HEATH COMPANY**  
A SUBSIDIARY OF DAYSTROM, INC.  
BENTON HARBOR 9, MICHIGAN

# Do you "SHOP AROUND" for Capacitors?

Save yourself time and trouble. Hammarlund has the *only* complete line of variable capacitors. Only in Hammarlund capacitors, the result of 45 years radio-electronic experience, do you get:

- **Quality beyond requirements**
- **Every one uniformly perfect**
- **Guaranteed dependability**
- **No waivers on performance**
- **At a fair price**

Independent studies show Hammarlund capacitors are preferred over any other make. So, there's no need to shop around for capacitors, others have done it for you—and they prefer Hammarlund.

For a free copy of the Hammarlund Capacitor Catalog, write The Hammarlund Manufacturing Co., Inc., 460 West 34th St., New York 1, N. Y. Ask for Bulletin C-10

**HAMMARLUND**  
Since 1910

## DAKOTA DIVISION

**NORTH DAKOTA** — SCM, Elmer J. Gabel, W0K7Z — The 'Phone net meets on 3845 kc. at 6 p.m. Mon. through Sat., the c.w. net on 3670 kc. at 6:30 p.m. Mon., Wed., and Fri. Let's dust off those "bugs" and give AOX a workout. The Red River Radio Amateurs of Fargo are working on next year's Hamboree. It's a new YL in the home of ODX, born July 12th. Congratulations to Tom and his XYL, Tom is one of the few North Dakota hams on s.s.b. He runs an 813-10 A rig. K0ATK has a new HQ-140X and found time to install the keying kit in his Ranger. VCQ is building a 14-Mc. beam. MXD back from the Park in July, is recuperating from a fall. In his words, he "missed a peak while playing mountain goat." DX-100s on the air and assembly line: SDN, BFM, and DIV. New hams: K0BWY, Q0B's XYL, K0CBD, and CBE at Hillsboro, KN0CCA at Bismarck. Traffic: W0K7Z 30, VCQ 26, UBG 22, KLP 21, OWY 20, HVA 15, MQA 9, K0ATK 8, W0OAB 4, BFM 3, GJJ 3, RAR 3, K0AIP 2, W0BEA 2, DNJ 2, PHC 2, PMZ 2.

**SOUTH DAKOTA** — SCM, Les Price, W0FLP — The emergency net is progressing under the able leadership of OXC, of Pierre, and has all the new 140X receivers and part of the BC610s that will play so vital a part in the South Dakota Emergency Net. The South Dakota Convention was held at Yankton, S. Dak., Sept. 3rd and 4th. LKO, OSQ, and QPC returned after three months on the Island of Guam, where contact was kept with K0FCE, at Ellsworth Air Force Base, Rapid City, on 20 meters. QKV has a new QTH with 900-ft. long wire. We have some very welcome new hams in Rapid City. They are KN0CDQ, the XYL of KAS, KN0CDN, the XYL of TOY, and KN0CDO, the XYL of QEK. Rapid City's youngest ham, KN0AKB, was eleven on Sept. 1st. Bill and Joan Drededahl, KAS and CDQ, are leaving for New Mexico. A report on the section c.w. net will be welcomed next month. The NQ Net reports attendance of 17 for July and some traffic handled. Traffic: W0GDE 88, OH 72, SCT 42, SMV 31, RRN 21, BLZ 19, DVB 14, QKV 7, RSP 4, GWS 3, WBW 2.

**MINNESOTA** — SCM, Charles M. Bove, W0MXC — Asst. SCM: Vince Smythe, 0GQK. SEC: GTX. RMs: KLG and DQL. PAMs: JIE and UCV. The ARRL has approved the Stillwater High Radio Club as a club affiliate. For information about the time and date of club meetings contact Bob Watson, YOC, who lives at 1022 So. Fourth St., Stillwater, Minn. KLG has been appointed assistant manager of the Tenth Regional Net. RLQ and TQA made BPL for July. TPN has moved to Memphis, Tenn. GFR has been mobiling up in Canada on week ends and checking into the 'phone net. TUS has been operating on an average of 6 to 7 hours a day. QDP now has WAC. GBG was in the hospital in St. Paul and YUN in the hospital in Crosby. BHY also is in the hospital in St. Paul. We hope that when you read this Frank, Clyde, and Swanny are well on the road to recovery. VBD has been operating portable at Lake Washington. In July picnic were held by the Minneapolis Radio Club, the St. Paul Radio Club, the St. Cloud Radio Club, and the Arrowhead Radio Club of Duluth, held at Grand Marais. Traffic: W0HFY 244, KLG 210, TUS 164, TQA 108, RLQ 107, KJZ 89, SYD 86, RVO 75, WMA 54, LUX 51, LST 46, WVO 46, OHS 31, VRK 31, KFN 27, QDP 27, VBD 27, OSJ 24, RLI 23, QNY 21, UNG 21, VXO 18, MBD 16, NTV 15, BUO 13, MXC 12, TQQ 10, GTX 9, VOA 9, FCU 6, TKX 6, RLQ 5, VEP 5, QVR 4.

## DELTA DIVISION

**ARKANSAS** — SCM, Owen G. Mahaffey, W5FMF — This section of the country has been almost too hot for much ham activity. HZU is a new ham in Rogers. K5AZG is a new ham in Springdale. BCZ has a new 75-meter 'phone rig on in Little Rock. SXM is a new ORS. EUQ is building transmitters for 6 and 2 meters, also a 40-meter mobile rig. He reports having received QSLs from 2EUQ, 8EUQ and 9EUQ. Get the rest of them, Bob. All Northwest Arkansas hams take notice: How about a Northwest Arkansas Amateur Radio Club? Let's hear from you. Traffic: (July) W5VAA 20, EUQ 4, ZJI 4. (June) W5CAF 53, ZJI 2.

**LOUISIANA** — SCM, Thomas J. Morgavi, W5FMO — BMD reports that a gathering of the members of the Ark-La-Tex Teenage Net is in the planning stage for Shreveport. This net meets on 3820 kc. at 4 p.m. CST on Mon., Wed., and Sat. K5AIE has been burning up the Novice c.w. band. He took the test and is expecting his Conditional Class license. CEW worked two new countries for a total of 201 worked and 192 confirmed. TRQ now has the new 1625 final on 75-meter 'phone and 40-meter c.w. The Lake Charles Radio Club is holding transmitter hunts every three weeks with about 15 mobiles taking part. ZSP has moved to a new QTH and expects to have antennas up soon and get back on the air. FKA is back from a trip up Jersey way. SQI received his WAS and WAC certificates. He worked 11 countries in one night with 100 watts and a 33-foot vertical on 20 meters. NDV is interested in starting an 80-meter net in Louisiana. All interested should get in touch with him. Our heartfelt sympathy to VEU on the loss of his XYL.

(Continued on page 86)

# Performance Beyond.

THE NEW

If you want a really fine receiver...one that will give you finer performance beyond the others you've operated, you want the new PRO-310.

Frequency readings to 1 part in 5000; continuously calibrated and spread over the entire range; single sideband operation; exceptional stability; high image rejection; and many other fine features will add up to finer listening whether you're a DX enthusiast, CD volunteer, or just a regular band-prowler.

Three years of intensive design and research engineering went into this rig plus the Hammarlund "know-how" developed by making thousands of sets for government service.

So, if you are one of those who demand the finest performing equipment available, look the new PRO-310 over. If your dealer doesn't have one now, he'll have one soon. Get specs and other information either from him or by writing The Hammarlund Manufacturing Co., Inc., 460 West 34th Street, New York 1, N. Y. Ask for Bulletin R-10

THE *Heart* OF THE

**PRO-310**

Newly developed front-end with three tuned circuits but only one RF tube amplifier provides remarkable selectivity and ultra-high signal-to-noise-ratio.

THE JAMES KNIGHTS COMPANY  
SANDWICH, ILLINOIS

in July. The Onachita ARC Field Day was a big success with CNG, MIWE, EGK, CQZ, EB, POB, FSN, YAD, UDX, PZL, and PVE participating and making 469 contacts. Looks like HEJ is headed for s.s.b. ARRL CD appointees, please check the expiration dates on your certificates of appointment and mail to the SCM for renewal. Traffic: K5FFA 485, W5NDV 72 EZN 16, FMO 14, YSN 13, UGJ 12, SGI 8, CEW 2.

**MISSISSIPPI** — SCM, Julian G. Blakely, W5WZY — One of the hottest news items of the season is that JHS is taking to single sideband. YFJ reports 30 full AREC members for the Gulfport-Biloxi Area, with 100 supporting stations on 29,600 Mc., with circuits into EAN, CAN, and PAN. BSA passed up a choice QTH in Greenville when he saw YAR's antenna broadcast from the porch. He chose another location and is in a triangle formed by YTZ, KFF, and DQY. Ifi, WZY and WZZ are in the process of changing their QTH and will be off the air until the new antenna farm is ready. We are pleased to hear that VQE is doing well after a recent operation. GUC has dropped the "N." 9LBO (ex-5BUC) is Korea-bound. The XYL is carrying on with WN5BPZ. KN5DKK was heard portable from GAFB. K5AYP's boys now are KN5BAE and KN5BAF. Traffic: W5VME 122, JHS 60, EDE 34, EWE 22, YFJ 20, RIM 14, YAR 13, BTM 10, WZY 10, GDW 8.

**TENNESSEE** — SCM, Harry Simpson, W4SCF — SEC: RRV, PAAL, PFP, RM: WQW. The Memphis Club's Ham School was a great success, with 63 new Novices in that area! Total attendance for Novice and General Class instruction was 119. The School was under the capable direction of DCH, assisted by BCA, CLL, FRB, SCF, WBK, and WTJ. If other clubs are interested in information on this project, contact any of the above. PL still is under the weather. CLQ is hospitalized with a fractured disc. DVM had a parasitic appendix removed, and VZU is having a hospital check-up. As you read this, the c.w. net will be in full swing under the able leadership of WQW. JVM reports good newspaper and TV publicity for hams in the Chattanooga Area. UWA, Ky., informs us that WJH has a brand-new XYL. TZB is moving to Johnson City but will be back in Knoxville for school. K2KML is a new Tennessee resident. FLW reports 6 meters was open on all but two July days. DMU reports the Davidson County 10-meter Net now has 39 members. WQT made 69,390 points in the CD Party. FEO, Bays Mountain RC secy., sends a nice report. PVD received a sticker from 110 countries. NLJ sends a fine report from the Smoky Mountain ARC and says 16 members operated the club station, OLB, during Hillbilly Home-Coming. He reminds us that the 2-meter net meets Thurs. at 1930 EST on 145.2 Mc. Members of the Frye Amateur Radio Club this summer arranged amateur communications to a camp for diabetic children. It was beyond telephone areas but tied in by several skeds a day from Jack Reeves, IBB, to Vern Etter, IIB. Traffic: W4HH 154, OGG 149, POP 120, UWA 61, TZD 59, WQW 52, VJ 40, BQG 35, TZB 33, ILLR 25, SCF 23, PAH 16, HUT 14, UWA 13, UVT 12, JVM 7, HXS 3, DMU 2, CLQ 1, CXY 1, DCH 1, FLW 1, FRB 1, LRO 1, PVD 1, WQT 1.

## GREAT LAKES DIVISION

**KENTUCKY** — SCM, Robert E. Fields, W4SBI — SEC: CDA, RM: KKW. Acting PAM: NIZ. In spite of the hot summer months, traffic reports show a marked increase. The latest list of nominees for KPN certificates are as follows: UNJ, UWA, ZCL, FQT, AVJ, HTB, and KBY, making a total of 58 members on the roster. July statistics are as follows: 31 sessions, 420 total call-ins, 13.54 stations per session, 72 total traffic, 2.3 messages per session. WNH is running skeds on 2 meters, but still working on the 500-watt final for 2 meters. AIT has completed construction of a DX-100. KFI/XI, not to be outdone, is handling traffic from his mobile station. JSH, Fayette County EC, reports 14 full and 1 supporting AREC members. RM KKW reports the following: 55 sessions of the KYN, 37 active stations, traffic total 204, average 3.7 messages per session. Kentucky has a combined KYN-KPN bulletin, thanks to CDA, NIZ, RPF, KKW, SUD, BAZ, SBI, and others. Please note than an official report from ARRL on Field Day activities places 4FU in third place for Class A, with a score of 18,009. He is a member of the Ohio Valley Amateur Radio Assn. Floyd County hopes to have an amateur on the air soon as SBI recently conducted a Novice Class exam for Wade Moore of Prestonsburg. Traffic: (July) W4QCD 193, KKW 166, SBI 87, CDA 66, NIZ 63, UWA 61, HOJ 56, ZDB 41, JSH 35, HSI 29, ZLK 25, BZY 20, ZDA 17, KFI/XI 14, RPF 14, SUD 10, IAY 7, K4AIT 6, W4QMW 6, KRC 5, SZB 5, JCXN 3. (June) W4NIZ 106.

**MICHIGAN** — SCM, Thomas G. Mitchell, W8RAE — Asst. SCM: Phone, Bob Cooper, 8AQA; Asst. SCM C.W.: Joe Beljan, 8SCW. SEC: GJH. You will note by the traffic totals that this month was probably the low point of the year for activity. Next month should see us back up there in the running and all fired up for traffic. DX, SS, and what have you. About the time this write-up is in your hands, the QMN will be back on the winter schedule with ELW as the new RM. Our thanks to URM for the fine RM job and our best wishes to ELW in taking over. The new schedule will start Oct. 3rd with NUL in charge of the

(Continued on page 88)

# HOW TO CONVERT YOUR RECEIVER

**FOR**

- True single-signal reception on CW
- Selective sideband reception on AM
- Superb performance on SSB

**Model 370**

**B&W**

**Single Sideband Receiving Adapter**

Relation of Model 370 passband to that of station receiver for various positions of the function switch.

Here . . . for the first time . . . is a truly selective bandpass type adapter for bringing the performance of yesterday's receivers up to the requirements of tomorrow! In addition to superlative performance on SSB, this unit offers true single-signal CW reception and selective sideband reception on AM phone signals.

Designed by B&W's single sideband engineering group, the Single Sideband Receiving Adapter can be used to convert *any* receiver having an intermediate frequency between 450 and 500 kc. On AM reception, B&W's exclusive "Gating Control" permits tuning over a narrow frequency range without disturbing the main receiver tuning. Sharp skirt selectivity on CW, AM phone, or SSB is assured by an integral 20 kc toroidal type band-pass filter with 3 kc passband. Signals outside passband are attenuated a minimum of 50 db. Easy to install and adjust, the unit is entirely self-contained in an attractive cabinet complete with power supply and 7" dynamic speaker.

*See it at your distributors' or write for literature*

## The Information Desk

of any big metropolitan library is always thronged with people trying to get help . . . "Where can I find out how many tons of coffee were imported last year?" . . . "What do I need to know to go into the dyeing and cleaning business?" . . . "Can you tell me the full name of the president of the Logo Co.?" . . .

This information and much more is on file and completely catalogued, saving the inquirer hours of aimless search.

Your file of QST, if it's continuous and current, will furnish you with ready references on amateur matters as the library does on general information. Want to know what changes in amateur regulations have been made? Looking for plans for the big rig? Thinking of a new keying system? SSB rig? Look through the annual index found in the December issue each year under the appropriate heading. It's as easy as that! Whatever amateur information you want, you'll find it in QST— if your file is complete.

Start your file now—the longer you have it, the more valuable it will get. Delivery to your door of your own "reference library" is yours if you

.30 net and ELW the 6:30 session. The THIN will continue as last year. QMN certificates were issued to the following stations for the '54/'55 season: SIB, SRK, WGU, and HSG. Some of the gang still are sending clippings and reports about the successful Field Day last June, so it still must be worth talking about. According to the latest *MOCD News Letter*, the RACES plan for Michigan has been printed and circulated to the e.d. organization. Gary will do likewise as soon as suitable meetings can be scheduled to discuss details with the Area ECs and their lower echelons. From this, it looks like this winter will see the RACES plans go into effect. Keep the AREC applications coming in to Gary or myself. Remember the Central Division ARRL Convention in South Bend on Oct. 15-16. Let's visit our neighbors and join the fun. I'll see you there. I'm sorry to have missed the picnics because of vacation and that's why this report is a bit short. Traffic: (July) W8NUL 95, NTC/8 69, QOQ 65, LLP 58, NOH 43, IJ3 38, HKT 30, RTN 29, SJF 27, FX 25, SCW 22, IV 14, RAE 12, PHM 11, HSG 10, MGQ 10, FGB 8, PDF 7, TBP 3, ZHB 3, DSE 2. **OHIO**—SCM, John E. Siringer, W8AJW—Asst. SCMs: J. C. Erickson, 8DAE; W. B. Davis, 8JNF; and E. F. Bonnet, 8OVG. SEC: UPB. RMs: DAE and FYO. PAMs: EQN and HUX. The Buckeye Net is working in conjunction with the W8 QSL Manager, NGW, in transmitting reminder messages to W8 amateurs who have QSL cards but no envelopes at the Bureau. HOH was heard in Oklahoma on 144 Mc. MGC has a new all-band V-37 antenna. PS informs us that three new Novices are in Hubbard. W8NUJG recently suffered a severe heart attack. May he have a speedy recovery. BOJ erected new antennas for all bands, including a 20-meter beam. The Toledo group had its best Field Day with 138 registering at the site. GZ, our outstanding OO, reported 34 amateur rule infractions during the month of July. He also identified three commercials operating in the 20-meter amateur band. JHH had the misfortune of having his station struck by lightning. We're pleased to learn that LMB is doing nicely following surgery. AL reports RNL, SWB, TNK, TGZ, and UNE passed their General Class exams. QXH received his 20-w.p.m. CP sticker. DSX, SRN Manager, states that Ohio was represented 37 times during July. Correction: The NVJ mentioned in August QST should have been MVJ. Toledo's *Shack Gossip* relates that new editors will replace HUX and HWX. These gals have done a splendid job during the past several years even to the extent of publishing tempting recipes. WE and OTK (OM and XYL) are moving from Findlay to Van Buren. Hamilton's *Feedline* mentions that OUD has a new 20-meter beam; ex-UJF is now living in Lake Success, N. Y.; RZA recently was released by the Air Force; and W8CYD is the newest licensee in town. The Canton group experienced its best Field Day and plans already are being made for 1956. We regret to record the passing of UZU, past-president of the Canton Amateur Radio Club. The Hocking Valley *Key Klax* reports that the following are members of the Club's "phone net": HPP, LGR, NAJ, GXR, DCX, RRQ, CSB, and EEQ. HPP is NCS. Springfield's *Q-5* informs us that Field Day was quite successful despite a shortage of operators and heavy rain. The OVARA's *Ether Waves* lists the Club's top DX men regarding countries worked: JIN-250, BRA-248, BTI-246, FGX-239, JJW-215. Not bad for a small town! Eastern Ohio's *Ham Flashes* states that QYR's son received the call W8SCDX; HLX, of Niles, has a new 60-foot tower; JOD is attached to WFMJ's staff; EKX, MJI, and MUX are attending Valparaiso Tech.; HDC has moved from Youngstown to Leetonia; WOL, of Warren, is now on 6 meters; W8SWAN is the newest call in Ashtabula; KA2WC's home is in Damascus, Ohio; and the Youngstown-Mahoning County C.D. drills are being held Mon. evenings on 29.5 Mc. Traffic: (July) K8FCJ 353, W8DAE 298, MVJ 263, AMH 151, ARO 139, IIR 104, AL 46, AJW 45, HNP 45, RO 45, HPP 32, AJH 22, QXH 22, WLM 21, HUX 16, BEW 12, JMD 12, W8SWTO 12, W8QHW 11, LMB 9, EQN 8, ET 8, GZ 8, PBX 8, PGQ 8, PIJ 8, CTZ 7, HFE 6, OPX 5, LGR 4, RZ 3, WYL 3, SBH 2, STR 2, URN 2, VTP 2. (June) W8ZAU 9, PBX 8, ILC 6, MGC 6, QIIW 3, DG 2.

### HUDSON DIVISION

**EASTERN NEW YORK**—SCM, Stephen J. Neason, W2ILI—SEC: RTE. RMs: K2BJS and TYC. PAMs: GDD and IJG. Because of severe sun poisoning of both feet, your SCM was unable to make the June report in this column. I am now fully recovered and spending my vacation as I write this on a beautiful northern lake. K2EIU will attend R.P.I. this fall and will be active from SZ. K2JWM will be portable in Ridgefield, Conn., and with the help of IRT will keep regular skeds with OM HM. K2HVN will vacation in Maine. Bill will take along his new modulator and 25-watt rig. K2GMV will tour Europe and will try to meet some of the boys he has worked over there. K2IKH passed his General Class exam and is busy setting up shop. K2LAD recently got his General Class and driver's licenses. Put 'em together and you'll find a 10-meter mobile rig in Hank's bomb. K2EDII has a new three-element

(Continued on page 90)

## A PAIR OF EIMAC 4X250B's— the easy, modern approach to a compact one-kilowatt CW and SSB rig

You'd be amazed how easy it is to build a one-kilowatt rig using Eimac 4X250B radial-beam power tetrades. Each of these bantam tubes handles 500 watts input with only 2000 volts on the plate. A pair in the final amplifier provides a kilowatt with the power supply and transmitter combined taking only a fraction of the space required for an old-fashioned kilowatt rack.

The straight forward modern approach afforded by 4X250B's allows simple circuit design. Driving power is so low that annoying TVI-producing harmonics generated in the driver stages are minimized. Low feedback capacitance makes stabilization of the amplifier stage easy.

The versatile 4X250B can supplant the famous 4X150A, and it offers the advantages of easier cooling and higher power. No forced-air cooling is required during stand-by periods if convection air is provided properly.

For further information on the new 4X250B, contact our Amateur Service Bureau or visit your Eimac distributor.

### TYPICAL OPERATION

#### 4X250B Radial-Beam Power Tetrode (Frequencies to 175mc per tube)

	Class-C CW or FM Phone	Class AB <sub>1</sub> RF Linear
D-C Plate Voltage	2000v	2000v
D-C Screen Voltage	250v	350v
D-C Grid Voltage	—90v	—50v
D-C Plate Current	250ma	250ma*
Zero Sig D-C Plate Current	—	100ma
D-C Screen Current	25ma	15ma*
Peak RF Grid Voltage	115v	50v*
Driving Power	2.8w	0w
Plate Power Input	500w	500w*
Plate Power Output	410w	325w*

\*Max Signal

An Eimac air system socket with built-in screen by-pass condenser provides optimum amplifier circuit stability and cooling arrangements for the 4X250B.

beam on 14 Mc. Jon has credit for WAC and eighty countries. Congrats to the 2RN 'Phone Net; the gang celebrated its second birthday with a picnic. LRW will fire up his new 20A and 500-watt linear amplifier, and to make things complete Marce will include more 50-foot masts and antennas for all bands including 144 Mc. this fall. RTE has returned from his tour of Europe. We trust that Ted has enjoyed a well-earned vacation. K2EHI has a new Elnac and receiver for the mobile. Members of the Ulster County Mike and Key Club assisted the Hudson Valley Firemen's Convention during a recent parade held in Kingston. Mobile communications were furnished by VAQ, SIF, PGE, and YOK. K2DRV acted as control from C.D. Headquarters station K2JBH. K2EKE has a new 813 final. SSV and K2CJW have new Heathkits (DX-100) ready for the fall. Traffic: (July) W2LRW 34, K2EDH 31, EKE 29, JWM 29, EHI 20, BE 6. (June) K2JWM 23, EDH 19, EKE 17.

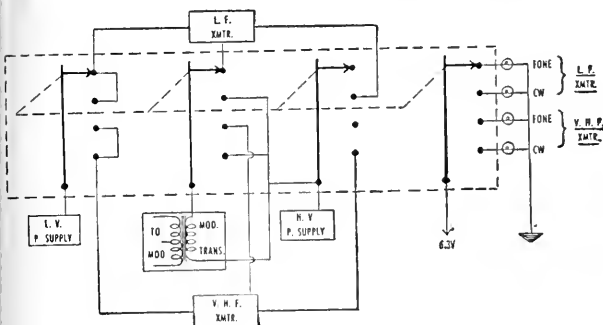

**NEW YORK CITY AND LONG ISLAND** — SCM, Carleton L. Coleman, W2YBT — Asst. SCM: Harry J. Dannals, 2TUK. SEC: ADO. PAM: NJL. RM: VNJ. It has been necessary for LPJ to resign as RM for 2RM because his job now requires more traveling. The section will miss his excellent traffic work and we hope he will be able to return to the Net soon again. ADO reports that 10-meter AREC activities were almost exclusively devoted to hidden transmitter hunts during the summer months. JOA reports that TAN (3630 kc. at 1830 EST/EDST) invites old-timers as well as teenagers to participate. NJL and his XYL, KN2JHQ, attended the NYSPETN picnic at Syracuse. K2GHS/1 kept up his Observer work while at camp in Becket, Mass. K2JEB is now pushing a big signal on the NLI Net with a 4-125A final. LGK reports that the Tu-Boro Club is planning another mobile "caravan" for early October. Despite the summer recess, AEE remained active in the NLI Net, with K2JFZ at the mike and key. IVA, PF's son, traveled in Europe on a motor scooter and visited some of the DX stations. K2DDK works 80 meters with Lysco 600S and 75A-1. He would like to know if anyone is interested in playing chess on 80-meter c.w. K2ICU now has a 300-watt rig. K2AVB completed a 6-meter transmitter for fixed or portable operation. K2EQH has broadened his bulletin work to include 2 meters as well as 20. K2GRE now is on 2 meters with an 832A rig. K2AMP has the Amityville Memorial HS station. K2GKQ, ready to participate in the Suffolk County RACES program. Ex-JXM, now 5JXM in Oklahoma, is active on the OLZ Net and sends regards to the NYC-LI gang. JGV/1 found DX-hunting good from his summer camp location in Massachusetts. ION/2, at Hicks-ville, is running 125 watts on 144 Mc. JOA and K2DDK are trying for YLCC. The section had a good turnout in the July 'phone and c.w. CD Parties. Let's see even more activity in October! GXC vacationed in W3-Land and found that his low power really gets out with a good antenna. KN2PBF is a new call in Oceanside. NIP qualified for a net certificate for his activity in NYSPETN. ADO's XYL now is active on 144 Mc. with a 2E26 rig. With this column, TUK concludes his work as Asst. SCM. It has been a pleasure assisting YBT in his work and the experience will help me to serve the section better in the future. Best wishes to Carl as he leaves office. These are his parting words to the section: "This is the last column with YBT as SCM. TUK takes over for the next two years. Many thanks and my sincere appreciation for your cooperation during my term. May I ask your assistance likewise for the new SCM. 73." Traffic: (July) W2JOA 184, JGV/1 116, WFL 96, NJL 70, K2GHS/1 54, W2IVS 41, K2JEB 29, W2LKG 16, AEE 14, TUK 10, K2AMP 7, KXZ 7, W2PF 6, VDT 6, GXC 4, K2ABW 2, DDK 2, HYK 2, ICU 2. (June) W2WFL 83, GXC 49, MUM 25, K2GHS/1 19, W2AEE 15, VDT 13, K2GRE 6. (May) W2JOA 11.

**NORTHERN NEW JERSEY** — SCM, Lloyd H. Manamon, W2VQR — SEC: IIN. PAM: CCS. RMs: NKD, EAS, and CGG. The 2nd Call Area TCPN outing was held in Middletown, N. J., with K2GTX as host. Those attending were K2BWP, BWQ, BWR, GML, EWP, JKA, CLL, IKS, W2HTD, KEB, KFV, QJO, YRW, ZOL, and SJO. Could be that in the rush we may have left someone out. If that is the case please excuse it. GUV is back with us again after a long tour of duty with the Army in different parts of the world. He is now at Ft. Monmouth and will be on the air from his quarters there. His former calls were W4GVU and KA2DX. YVQ has been QRL while on the road and on vacation. NJN operated six days a week in spite of summer vacations. EAS is doing a fine job as RM keeping up summertime interest. By the way, EAS just received an EAN certificate. K2HXP is on 50 Mc. He needs a copy of Jan. 1946 QST. Can anyone help? K2IKS is planning to operate portable in VE-2 and VE-3-Land this fall. BRC is rebuilding for the fall season but got in the July CD Party just the same. CVW now is settled in a new QTH. He has no antennas as yet but ran up 23,760 points in the CD Party with a wire strung in the attic. GVZ has been hit by the summer lull but promises to be back full strength come the fall season. EWZ has a new 33-ft. vertical. A new club in the section is St. Peter's Prep. Radio Club, with headquarters at 144 Grand Street, Jersey City. The Club was started in November of '54 with no one having any type of radio license. Presently there are 3 General Class and 8 Novice licensees as a direct result of the club activities.

(Continued on page 92)

# MALLORY HAM BULLETIN

## Switch Common Power to several RF Transmitters with Mallory "Hamband" Switches

Mallory #1600 Series Rotary Switches, better known as "Hamband" switches, were designed especially for coil switching in high frequency transmitter service. However, the heavy, wide-spaced contacts, high quality ceramic insulation, and positive indexing which make these switches so desirable for use in transmitter plate circuits, also, give them exceptional capability for many other switching functions.

For example, the diagram above shows how a #164C (4 section "Hamband" switch), connected as a circuit changer, permits operation of two separate RF chassis from common power supplies and a single modulator. VHF operators in particular, who operate separate rigs above and below 50 megacycles, will recognize the economy and convenience this arrangement adds to such a station. With contact carrying ability of several hundred milliamperes, and with 1000 volt insulation, this switch is entirely adequate for transmitter powers up to 100 watts.

The circuit shown was devised by a dyed-in-the-wool VHF man to permit the addition of a low frequency RF unit to his existing VHF transmitter, and still use only the common power supplies and single modulator shown. However, there is no reason why a dyed-in-the-wool *low frequency* man couldn't make the change the other way 'round, and let the #164C switch help him explore the possibilities of VHF operation with a minimum expenditure of funds for new gear.

When using the #164C for this application, the usual high voltage wiring precautions should be observed, even though the exact circuit arrangement may be modified to suit individual requirements. The one shown has the indicator-lamp circuit located adjacent to the panel, the low voltage supply next, then the high voltage, and last the modulator transformer shorting section for CW operation. The physical location of the switch in relation to the power supplies, modulator and RF chassis is not important, and may be placed for maximum convenience. The circuit shown has the switch located within the modulator housing. Separate input and output sockets for each piece of equipment are mounted at the rear of the modulator.

The convenience and efficiency added by this circuit has been reported by its user to be most satisfying. Why don't you investigate the money saving possibilities Mallory rotary switches offer? Your Mallory distributor will be glad to help you select the right one.

**RELAY LEAGUE**

WEST HARTFORD 7, CONN.

The club call is K2OQJ. The big news for the month of July is that two more new General Class licenses have been obtained — K2LWX, age 14, and K2LSU, age 16. The Club desires to maintain skeds with other high school clubs during the coming fall season. Contact K2LSU, the secy., for skeds. Other officers are K2KRE, pres.; KN2KUD, vice-pres.; and K2KOS, moderator. This is a splendid example of what can be accomplished by group activity. It is suggested that readers who desire to get started in ham radio contact their local club. If you do not have the address, contact the SCM and you will be referred to the nearest club in your neighborhood. K2CHI is erecting a new three-element 20-meter beam. K2IPR is on 144 Mc. with a new Gonset final. K2ICE is QRL with seasonal business going strong and has no time for ragchewing. FCC and BRC were heard mobile on 144 Mc. from Eagle Rock. K2DHE is the chief antenna erector in Monmouth County. He specializes in swinging aloft from 100-foot towers with sixteen and thirty-two elements surrounding him. Traffic: W2EAS 137, K2GAS 109, GFN 53, W2HTD 28, CCS 26, K2IKS 21, BWQ 18, CHI 2, W2NIY 2, CVW 1.

## MIDWEST DIVISION

**IOWA** — SCM, Russell B. Marquis, W0BDR — The Cedar Rapids Club was host to the 75-meter 'phone net picnic, at which 144 licensed Iams were present with a total attendance of 255. The Waterloo and Creston Clubs also had picnics. SLC has a new KWS-1 and 75A-4. K0BZF and K0CCZ have General Class licenses. K0CCZ hopes to operate from Turkey while on duty there with the Navy. BBZ is home on leave from the Navy. BVE is on leave from the Air Force and will be stationed at Sioux City Air Base. SCA has a new Elmac mobile rig in a new Buick. CGY is on vacation in Ohio. FMX is vacationing in Colorado. UCE and SQE received ORS appointments. PZO made second high traffic score for the second month. HMM is starting code classes for General Class aspirants. LPK has returned to Cedar Rapids after several years near Chicago and has rejoined TLGN. LGG did a fine job as liaison station to TEN, substituting for BDR while he was on vacation in Wyoming. BDR attended the Fort Dodge and Fairfield Club meetings. QVA received a certificate for perfect copy of the Armed Forces Day message on May 21st. FWF is the newest member of TLGN. The Dayenport Club is building a Novice station in addition to the kw. rig. SQE spent a week in Buffalo, N. Y., at a radio and TV school. VEM has received a WAC certificate. Traffic: (July) W0SCA 1103, PZO 856, BDR 543, CZ 319, SQE 81, LJW 76, BLH 51, LGG 41, QVA 40, TGQ 25, NGS 13, IUY 5, PAM 5, SRQ 5, KJN 4, PUR 4, UTD 4, NYX 3, FDM 2, IHC 2. (June) W0SQE 45 TGQ 33.

**KANSAS** — SCM, Earl N. Johnston, W0ICV — SEC: PAH. PAM: FNS. RM: NIV. VGE received her General Class ticket July 15th. Congratulations. Becky also has the honor of being the only one sending in a bit of news for station activities this month. (May) W0QGG 47, DEL 17, WWR 9, UAT 4.

**MISSOURI** — SCM, James W. Hoover, W0GEP — SEC: VRE. PAM: BVL. RM: OUD and QXO. VTF has added a VFO to his rig. SAK appeared on KRCC-TV and discussed amateur radio. OMM's son has returned from Alaska. K9FCT wants traffic schedules on any band, 'phone or c.w. TCF is moving to Minneapolis. GCL installed a 75-meter mobile and plans to use it during a vacation to Colorado. The Southwest Missouri Amateur Radio Club had stations operating in Springfield for reporting the arrival of airplanes during the Powder Puff Derby. Participants were HUI, EBE, QWS, SPU, LQC, ICW, CZC, GBJ, and HGD. EBE is handling RACES applications in the Springfield Area. Traffic: (July) W0CPI 866, GAR 398, VTF 278, GBJ 169, SAK 164, OMM 144, HUI 104, RTW 99, K9FCT 72, W0UOD 70, MRQ 46, CKQ 34, VWZ 26, BVL 22, KIK 15, IIR 13, VPQ 8, BUL 6, FLN 6, EBE 5, KA 5, TCF 1. (June) K9FCT 148.

**NEBRASKA** — SCM, Floyd B. Campbell, W0CBH — Asst. SCM: Tom Boydston, 0VYX. SEC: JDJ. PAM: EUT. KN0AKR, AKV, AKW, BBC, BJT, and BNP, at Scottsbluff, have formed a new net with KN0AKW as NCS. It is called the S.A. Net and meets at 8 p.m. MST every Mon. and Thurs. on 3735 kc. Relaying and delivering messages to the Panhandle is its goal. HMN is listening on 2 and 6 meters and building a power pack for 6 meters and vertical ground-plane antenna. DDT is the regular Mon. NCS on TEN and NCS for the Nebraska C.W. Net 3 nights a week. UOV was mobile on his vacation in South Dakota. BZS has returned to North Platte from Salt Lake City. 7MYD, in North Platte as general foreman for the Union Pacific, has been transferred to Hinkle, Ore. KXD sure is going to have a nice shack when he gets moved into his new home. IBA can be heard operating from McCook now. CBH has just about finished his monoscope. ERM is the new EC at North Platte. More ECs are urgently needed for all parts of Nebraska. Please select one for your club and request your SCM to make the appointment. Another

# 6 METER

## "Communicators"

### PORTABLE..

9-1/4" high,  
10-3/8" wide,  
7-3/4" deep.  
Weight approx.  
20 pounds.

### AC/BATTERY

Merely use appropriate plug-cable for AC or DC operation.

### 6 METER LINEAR RF POWER AMPLIFIER

Add to your 6 meter Communicator, (or other 6 meter, 5-6 watt modulated equipment) to increase POWER OUTPUT to 50-60 watts. Simple to adjust, foolproof in operation. Uses push-pull 826 triodes, (supplied) with forced air cooling. Has heavy-duty 115V AC power supply. Antenna relay is built-in.

Models available on special order for commercial, government, aircraft frequencies from 50 to 150 mcs. Your inquiries invited.

6 METER RF LINEAR.....Net 149.50

Same size and style  
as Communicator...

Now--6 meters in the desirable, widely accepted 2 meter Communicator package. Here is a complete station, suited equally to fixed or portable operation, with performance comparable in every respect to larger sized communications equipment suitable only for fixed station use.

The excellent receiver features "Cascode" R.F. for high sensitivity, dual conversion for image rejection and added selectivity useable on 6 meters. Tuning range includes 49 meter BC band, a real assist in spotting band openings. Gonset noise limiter and adjustable squelch make worthwhile contributions to overall receiver performance.

Transmitter uses 2E26 final to provide power output of 8-10 watts with high level modulation. Power supply is self contained, universal for 6 volts, (or 12V) DC and 115 volts AC.

CONNECTICUT — SCM, Milton E. Chaffee, W1EFW — SEC: LKF, PAM; LWV, RM; KYQ, MCN and CN 3640 (0645 and 1845); CPN 3880 (1830); CTN 3640 (Sun. 0900); CEN 29,580 kc. We are now well into a new traffic season. C.w. traffic men are urged to meet CN or MCN, originate and handle traffic, and send a monthly report to the SCM by the 5th of the following month. CPN will welcome the 'phone traffic men daily or Sun. at 1000. CTN is a training net for those whose c.w. speed is below that customary on CN but who want to learn how to handle traffic. ORS and OPS appointments are available from the SCM to all who qualify. ANU is chasing DX on 20 meters with 35 watts, expects a new 3-band rhombic soon, and seeks OO appointment. A fine report was received from EJH, Bridgeport EC, on the activities of BRACES. There are four active 2-meter nets for the Fairfield County gang. UIZ now is with RCA in New Jersey but finds time for v.h.f. fun. RAN, in the Army at Fort Bragg, bemoans weak CN signals for QNI; he may soon be on K4WEE (MARS). BDI enjoyed VE1 mobile and CN QNI from northern points. NFG has

## C.W.A. EIGHTH ANNUAL CONNECTICUT QSO PARTY OCTOBER 22-23, 1955

All Connecticut amateurs are cordially invited to take part in the Eighth Annual Connecticut QSO Party to be sponsored by the Connecticut Wireless Assn., Inc.

Rules: (1) The party will begin at 5:00 P.M. EST October 22nd and end at 11:00 P.M. EST October 23rd. (2) Any and all amateur bands may be used, and either 'phone, c.w., or both. C.w.-to-'phone and cross-band contacts are permitted, but no extra credit is allowed for such QSOs. (3) The general call will be "CQ CN" on c.w. and "CQ Connecticut" on 'phone. (4) The same station may be counted but once regardless of band. Mobile, portable and home stations covered by the same station license all constitute the same station. (5) Exchange names of town areas. (6) Score one point per contact; multiply contact points by number of town areas worked for final score. (7) Reports must show times of QSO, call of stations worked, town area of station worked. All reports must be postmarked no later than November 15th and should be sent to Tony Dorbeck, W1YNC, 1650 Stanley St., New Britain, Conn. (8) Special recognition to the high scorers and to the highest-scoring Novice. All decisions of the C. W. A. Contest Committee will be final.

Here is an opportunity to see how many Connecticut stations you can work in a 30-hour period. Get on the air October 22nd and 23rd and meet the gang around your section!

been mobile on 10 meters down Florida way visiting 4FH. GIX and TD are covering all OBS skeds and GIX adds the only OO report. An FB bulletin was received from the Middlesex RA. How about other clubs? EFW mobilized on 2 meters in Maine and worked five states during the opening July 29th. Our section space in QST is mighty hard to fill without your monthly reports. How about more news of clubs? Note to ARRL appointees: Watch your certificate expirations and forward certificate to the SCM for renewal on time. Traffic: (July) W1YBH 233, NJM 90, YNC 90, AW 82, LIG 81, CUH 77, RGB 41, LV 31, TYQ 27, BDI 14, EFW 13, KV 10, RAN/4 6, UED 6, EJH 5. (June) W1RAN/4 14.

MAINE — SCM, Allan D. Duntley, W1BPI/VYA — SEC: TVB, PAM; TWR, RM; EFR. The Pine Tree Net meets on 3596 kc. at 1900. The Barnyard Net meets Mon. through Sat. at 0800-0930 on 3960 kc. YVN is the new net manager. The Maine 'Phone Net meets Mon. through Sat. 1700-1800 on 3940 kc. The Sea Gull Net will replace the Maine 'Phone Net with the return of Standard Time. We wish to thank all who have made the Maine 'Phone Net a success these summer months. Many of the boys and girls were very happy to meet the "Earl of Crow Island," ZE, and "Lady Margaret" while they were sojourning on Heartbreak Ridge. VXU and NXX have the solution to finding hidden transmitters. ZAH has a new mobile mike, won at the transmitter hunt at the annual Casco Day. Next year we hope you fellows won't keep BYK waiting so long for a

**“Designed for the Ham  
Who Demands the Best”**

Radio Specialties, Inc. proudly presents the greatest development in rotary antennas. This is the result of 20 years of development and research by S. E. “Dick” Adcock of Miami, Florida who has designed and perfected this most revolutionary antenna ever to be used by the Amateur. The ultimate in engineering design and the finest of materials are combined with precision workmanship to create a product unexcelled in the antenna field.

The extremely low vertical angle of radiation will provide the BEST in DX reception. Extraordinary front to back ratio guarantees minimum QRM. Exceptionally high forward gain assures outstanding reports. On the air tests by W4GL over a period of many years have proved that this all driven array has outperformed any parasitic antenna as to forward gain, front to back ratio and a desirable radiation angle. W4GL'S outstanding signal using the all driven array has been heard the world over with excellent reports.

• **Model No. 3DA20**

**Amateur Net \$350**

W4GL'S ALL Driven Antenna is now available for immediate delivery through your Distributor.

# BUD RADIO, Inc.

Dept. Q

2118 East 55th St.

Cleveland 3, Ohio

smoke. Thanks to ANI (Glastonbury, Conn.) for his assistance on that day. You guys and gals, don't forget to send in your certificates for endorsement. Also, anyone interested in new appointments, get in touch with your SCM, SEC, PAM, or RM. 7NXY showed the boys what call letter license plates look like. Now is a good time to affiliate with the radio club in your area. There are many good up-and-coming clubs in Maine. Anyone noticed a peach-colored Plymouth parked at or near 27 Canabas Ave., Waterville, Maine? Traffic: WILKP 99, SME 73, EFR 61, UDD 42, BX 21, TWR 21, YVW 21, LYR 14, QUA 12, BAD 11, BBS 9, DNV 8, NXX 4, OTQ 4, YVN 4, BDP 1.

**EASTERN MASSACHUSETTS**—SCM, Frank L. Baker, jr., W1ALP—New appointments: THO, QLT, and BPW as OOs; BPW as OBS. Appointments endorsed: RQZ Abington, LJH Plymouth, LPM Natick, MBQ Vineyard Haven, as ECs; BY and MX as ORS; PXH as OO; MX as OPS; CTW as OES; RQZ as OBS. New officers of the Middlesex Amateur Radio Club are FZG, pres.; CWH, vice-pres.; FQC secy.; COL, treas.; DLF, chief eng.; FQG act. mgr. Heard on 2 meters: RCY, RFN, and QKJ. RGR is on 75 meters. ASG has a new son and WK is now a grandpa. YHK has a new son. SRG is active in several nets. JJY is moving to Baltimore to take a job with Westinghouse. THO is busy with DX on 6 meters, also mobile. MEG is building a new 6-meter crystal converter and bought a Techcraft 2-meter crystal converter and six-element 2-meter beam. The South Shore Club held a summer meeting. The Braintree Club held a meeting. UKO has a sticker for all 67 counties of WANE and has WAM, BPW has a 6146 on 80-meter c.w. WU went to Maine for 2 weeks and took the rig with him. AKN is on 2 and 80 meters. QLT has been doing some ground-wave studies on 21 and 28 Mc. RM QMU had a vacation in New Hampshire. PIW went to Vermont. LNU is working in Maine. UG had an operation. UKA is away most of the time. SXD is back from DL4-Land. Newton gave a c.d. drill for Alderman. WN1FIL is a new YL in Dorchester. CTW has WAS for 15-meter c.w. AVY had an operation on his throat. WN1DIY worked C/Land with a 30-watt Heathkit. CDO's father supplied South Eastern Massachusetts Club's location with a black top walk. WNs FJI, FJQ and FMG all have Heathkit AT-1s. New officers of the Bedford Radio Club are YFP, pres.; YYI, vice-pres.; Geo. Kozlowski, treas.; ZSG, secy. The Club had over 75 at its annual club supper. QJB is on 10 meters. WEW is on 2 meters. The Bedford Club was out on Field Day with YYI, YWY, YFP, DTN, QJB, KJO, NAD, NDI, RSY, and ZSG operating. The Billerica C.D. 10-meter Net meets on 29.12 Mc. Mon. nights with WYY as net control. DEE has a BC-474 on 80 meters. EIQ is mobile on 10 meters. BFV wants help with his TNS. DTA has a new home in Concord. KJO has a Lyseo mobile rig. RSY, NAD, and NDI received awards from the Bedford Club for their c.d. work. WN1EIT, the XYL of ZSG, passed her Novice Class exam while in the hospital. YYI had 750 watts s.s.b. 2IVT came to the Club's supper. WN1ETX is very active on 3703 kc. AKN's boy, 4SRA, now is living in Hingham and has a sked on 80 meters with him. ALP and his XYL, CLF and his XYL, VYH, and VYI attended the outing of the Cape Cod & Island Net at West Dennis. Mr. Tennenbaum, of the Weather Bureau in Boston, spoke on hurricanes and the help that the amateurs can give. Officers were reelected for another year at this annual meeting. Traffic: (July) KIUSA 266, W1EPE 148, UO 111, WSN 107, IBE 43, BPW 19, WU 9, AVY 8, QLT 4. (June) W1AKN 3

**WESTERN MASSACHUSETTS**—SCM, Osborne R. McKeraghan, W1HRV—SEC: RRX. RM: BVR. PAM: QWJ. The WMCW Net meets on 3560 kc. Mon. through Sat. at 1900 EDST. The WM Phone Net meets on 3870 kc. Wed. at 1800 EDST. MNG has been appointed c.d. director of Agawam. Also in Agawam, OBQ is communications chief and VNH assistant. HRV is now Radio Officer for Easthampton. AJV, Webster, is a new OBS. ZUU is the new president of the Central Mass. Amateur Radio Assn. and is doing a fine job with the c.w. traffic nets. BKG, LPQ, and DPY are working on RACES plans for their towns. A well-attended meeting of Area 4 Radio Officers was held in Chicopee to talk over plans and progress. Much has been accomplished and area and sector organization is progressing rapidly under the direction of Area RO ICW, CO EVZ, and Director Newman. AZW is nearing DXCC. BYH received WANE and is now working DX on 20-meter c.w. Communications for the Powder Puff Derby, which ended at Barnes Airport, Westfield, were ably handled by amateurs. Eunice Gordon, UKR, national chairman of the radio network for the Derby, did a fine job of organizing complete coverage for the route of the fliers. At this end of the route four transmitters were in operation about 18 hours a day for 5 days, one on 20, one on 75, and two on 2 meters. Volunteer operators and owners of equipment used included the following: CLW, DGJ, YYT, KUE, KUL, CSR, TPH, MNG, VNE, VNH, QUQ, CGY, OBQ, TZV, WDK, ZIO, ULY, MSN, SRM, AJX, WDW, 2IGV/1, FFV, KEB, and 8KSM. Much credit is due these operators and the HCRA for the time and effort put in to furnish a splendid job of communications: Traffic: (July) W1ZUU 126, BVR 97, WEF 95, TAY 37, MNG 32, DVB 6, UVI 6, HRV 5, JAH 4. (June) W1ZUU 22, DPY 3.

# NEW MULTIPHASE "Q" MULTIPLIER

- Peaks Desired Fone or CW Signal
- Nulls Out Interfering Carrier up to 50 DB.
- No Loss in Speech Intelligibility

- No Insertion Loss — New Two Tube Circuit
- Special High "Q" Pot Core Inductor

**MODEL AQ**

**MODEL DQ**

**MODEL B SLICER**

## CONVERTS MODEL A SLICER

Plugs into Model A accessory socket, converting it into a Model B. New front panel and controls provided. Enjoy all the advantages of "Q" Multiplier selectivity on CW, AM & SSB with your present Model A Slicer.

Wired ..... \$29.50  
Kit ..... \$22.50

## FOR AM, CW, SSB OPS

Desk Model "Q" Multiplier for use with any receiver having 450 to 500 KC IF. In attractive, compact case with connecting power-IF cable. Power supplied by receiver. Also provides added selectivity and BFO for mobile SSB or CW reception

Wired ..... \$29.50  
Kit ..... \$22.50

## BUILT-IN "Q" MULTIPLIER

Upper or lower sideband reception of SSB, AM, PM & CW. For use with any receiver having 450-500 KC IF.

Wired ..... \$99.50  
Kit ..... \$69.50

## MODEL A SLICER

Same as Model B but less "Q" Multiplier  
Wired ..... \$74.50  
Kit ..... \$49.50

## A NEW CONCEPT IN LINEARS

## MULTIPHASE 600L

### BROAD BAND LINEAR AMPLIFIER

### NO TUNING CONTROLS!

### SINGLE KNOB BANDSWITCHING 10-160 METERS

- Single 813 in Class AB<sub>2</sub>. Approx. 2 watts effective or 4 watts peak drive for 500 watts DC input.
- New band-pass couplers provide high linear efficiency: 60-65%.
- Designed for 50-70 ohm coaxial input and output.
- Built-in power supply. Bias and screen regulation. Automatic relay protection.
- Exclusive metering circuit reads grid current,

watts input, RF output, reflected power from mismatched load switch to any position while on the air!

- Completely shielded — TVI suppressed. Free of parasitics! Low intermodulation distortion.
- Choice of grey table model (17 $\frac{3}{8}$ " W, 8 $\frac{3}{4}$ " H, 13" D) or grey or black rack model.

Wired, with tubes ..... \$349.50

**MODEL 20A**

- 20 Watts P.E.P. Output SSB, AM, PM and CW
- Bandswitched 160 — 10 Meters
- Magic Eye Carrier Null and Peak Modulation Indicator

Choice of grey table model, grey or black wrinkle finish rack model  
Wired and tested ..... \$249.50  
Complete kit ..... \$199.50

## MULTIPHASE EXCITERS

### Check These Features

### NOW IN BOTH MODELS

- Perfected Voice-Controlled Break-in on SSB, AM, PM.
- Upper or Lower Sideband at the flip of a switch, with 40 DB. suppression.
- New Carrier Level Control. Insert any amount of carrier without disturbing carrier suppression adjustments.
- Talk yourself on frequency.
- Calibrate signal level adjustable from zero to full output.
- New AF Input Jack For oscillator or phone patch.
- CW Break-in Operation
- Accessory Power Socket.

**MODEL 10B**

- 10 Watts P.E.P. Output SSB, AM, PM and CW.
- Multiband Operation using plug-in coils.

Choice of grey table model, grey or black wrinkle finish rack model. With coils for one band.  
Wired and tested ..... \$179.50  
Complete kit ..... \$129.50

# NEW VERTICAL ANTENNA

## Provides Amazing Results

... even on LOW POWER

- Self-supporting
- Base insulated for 20,000 volts
- Hot-dip galvanized tubular steel construction
- Easy to erect with interlocking sections

New Lewis Vertical Antenna is equipped with winch-operated Snorkel Mast which permits you to vary the electrical length of your antenna by 18 feet! Screw-in anchor feet withstand 4,000 pounds strain . . . field tested in 80-mph winds! Requires less than 1 square yard at base . . . low standing wave ratio characteristics . . . broad band. Lewis antenna can be erected by two men in two hours or less. Mail coupon today for free details.

#### 4 SIZES AVAILABLE

Lewis 2-37' 10-20-40 Meters . . . \$ 89.50  
 Lewis 3-47' 20-40-80 Meters . . . \$107.60  
 Lewis 4-56' 20-40-80 Meters . . . \$124.80  
 Lewis 5-66' 40-80-160 Meters . . . \$142.00

**NEW HAMPSHIRE** — SCM, Harold J. Preble, W1HS — SEC: BXU, RMs: CRW and COC. PAM: CDX. ARR and DYE both made BPL Two in one month is unusual for New Hampshire. Those interested in a New Hampshire section 'phone net, contact CDX. ZPA is at Air Force Technical School, Biloxi, Miss., for a course in radio and radar. The Port City RC is very busy with plans for a new club house and is planning big things after the September election. JUJ is doing an FB job handling WANE certificates. 2BBR and PRL spent vacations in Portsmouth. The Nashua Mike and Key Club is planning the New Hampshire State Convention for October. Among stations operating portable in New Hampshire this summer were 7NVY, at Freedom, and 1AJT, at Littleton. WUU is very active on 'phone and is regular TCPN net control. It's good to hear JNC back on the air while recuperating from a recent operation. CCE operated part of July in Rhode Island and ZIZ was active in Connecticut. 2JOA needs Hillsboro for WNH on c.w. ARR is a freshman at U.N.H. this fall. Welcome to Novices ETJ, EVG, EVY, FBH, FCU, FDC, FGX, FIH, FJY, FKZ, FZA, FZS, GDO, GDI, and GNW. Traffic: (July) W1ARR 637, DYE 147, ZIW 90, CRW 64, QGU 35, GMH 28, COC 26, CCE 15, IP 14, CDX 8, WBM 8. (June) W1QGU 22.

**VERMONT** — SCM, Robert L. Scott, W1RNA — Nets: VTPN meets on 3860 kc. at 0930 Sun. only. GMN on 3860 kc. at 1200-1300 Mon. through Sat.; VTN on 3520 kc. Mon., Wed., and Fri. at 1900. OAK advises the following were issued net certificates for VTN: IT, BNV, VZE, DAQ, BJP, ZNM, MKM, JLZ, FPS, CBW, TAN, TXY, VTP, QJQ, ELJ, and TAG. VZE reports working W3VZE/M. I have two or three recommendations for ORS but because of their membership lapse in ARRL I am unable to issue the certificates. It is suggested that any of the gang who have any question as to their status in the League check up on the matter. If a member of your family is a ham, they may have membership for \$1.00 — just one copy of QST to the QTH, though. Traffic: W1OAK 104, CMY 101, UEQ 47, RNA 38, KJG 20, BJP 17, IT 5, UGW 2.

#### NORTHWESTERN DIVISION

**ALASKA** — SCM, Dave A. Fulton, K1ZAGU — The 1955 All-Alaska Ham Convention was a great success. The Hamfest was sponsored by the Anchorage Amateur Radio Club and was held in Anchorage this year. There were 120 licensed hams registered and 119 attended the banquet. AOT and ANG shared honors for the best mobiles. BJW won the hidden transmitter hunt, BK the ragchewers contest, and CC walked away with the c.w. honors (35 w.p.m. with a stick). The highlight of the affair was a visit by Northwestern Division Director E. Rex Roberts, W7CPY. Rex visited Fairbanks before attending the hamfest in Anchorage and stopped at Juneau on his way back home. This is the first time that an ARRL official has ever visited the territory and we certainly hope it won't be the last. If Rex enjoyed it here half as much as we enjoyed having him, we know it will not be the last time for him.

**IDAHO** — SCM, Alan K. Ross, W7IWU — Smelterville: WHZ is applying for OPS appointment. Bonners Ferry: KNTZGE is applying for AREC membership. His rig is a Viking Adventurer and an S-53A receiver. Gifford: VWS worked Maine for his 45th state. He also is after the WAVE award (worked all VE), and has a permanent pen and radio pal in KCNE. Lewiston: A new ham in town is ZYZ. OWA has a new all-band 150-watt rig, but is working on a new p.p. final using 4-125As. Rupert: CAF operated portable from Washington, D. C., in June. We are sorry to hear of the passing of IEX, formerly of Rupert. Idaho Falls: a nice letter was received from VK2TN, who is visiting and enjoying W-Land. BAR and others have been entertaining him. Preston: A very nice letter arrived from RKI who reports he is experimenting with transistors and building a monitor receiver for 3935 kc. A new Novice in town is WN7AOR. Meridian: MKS represented your SCM at Big Springs. Sorry I couldn't make it in person. Traffic: W7OWA 26, WHZ 11.

**MONTANA** — SCM, Leslie E. Crouter, W7CT — Capt. Albert White, ZKV, of the Great Falls Army Air Force Base, felt that their I.f. communications channels could be jammed but that they could get a fix to a particular location. ZKV thought that amateur radio (mobile with loop antennas) in those localities when alerted and with arrangements with the local sheriff could track down and make an arrest of the jamming station. The Great Falls Emergency Corps responded, as reported by net control and EC DSS. TLA, mobile, assisted by TSG, was the hidden transmitter, with 19 hams and 17 stations taking part, of which 9 were mobile doing the hunting. All used loop antennas to look for the hidden rig on 3910 kc., with GFT the only one using an FS meter. GFT found the station in about ten minutes. Capt. White wants something like this in all of four or five of these northern states but wanted it tried out to gain experience to help in organizing. The Old Faithful Radio Club operated under the club call, ZOD, at the Park/County Fair. YPN has been in the hospital and is now taking it easy. VGY is finishing a new 150-watt rig, LPL spent his vacation in Yellowstone Park. On July 3rd TPE, Wolf Point; OYP, Wolf Point; TNJ, Glasgow; and SEW, Malta, set up com-

(Continued on page 100)

## OSCILLATOR SPECIFICATIONS

	FO-1 (fundamental)	FO-1B (overtone)
Freq. Range	200 KC. 15,000 KC	15 MC-60 MC (in 5 ranges)
RF Output	3 to 10 volts into 1200 ohms	2 to 7 volts into 18000 ohms
Plate Power	210 volts @ 5 ma	150 volts @ 8 ma
Heater Power	6.3 volts @ 150 ma	6.3 volts @ 175 ma
Tube	6BH6	6AK5
Maximum Drift with $\pm 20\%$ change—	.0002%	.0002%
Maximum Drift with (+) Plate Voltage Change	( $\pm 20\%$ ) .0002%	( $\pm 10\%$ ) .0015%
Calibration Tolerance	.001% to .01% depending on FX-1 crystal used	.001% to .01%
Size	4"x4"x3" overall	4"x4"x3" overall
Mounting	4 holes (with brackets provided)	

## PRINTED CIRCUIT OSCILLATORS

for Generating Spot Frequencies with **GUARANTEED**  
Tolerance from 200 KC to 60MC

Since the operating tolerance of a crystal is greatly affected by the associated operating circuit, the use of the FO-1 Oscillator in conjunction with the FX-1 Crystal will guarantee close tolerance operation. Tolerances as close as .001 percent can be obtained.

### FO-1 for Fundamental Operation 200 KC to 15,000 KC

FO-1—Oscillator Kit (less tube and crystal) .....\$3.95

FO-1A—Oscillator, factory wired & tested with tube (less crystal) ...\$6.95

### FO-1B for Overtone Operation 15 MC to 60 MC

FO-1B—Oscillator Kit (less tube and crystal).....\$3.95\*

FO-1BA—Oscillator, factory wired & tested with tube (less crystal) \$6.95\*

\*Includes coil in one of five ranges: 15-20 MC, 20-30 MC, 30-40 MC, 40-50 MC, or 50-60 MC, specify when ordering. Extra coils 35c each.

## FX-1 CRYSTAL Companion to the FO-1 Series Oscillator

The FX-1 Crystal is designed for use only with the FO-1 Oscillator. For tolerances of .01% and .005% any FX-1 Crystal can be used with any FO-1 Oscillator.

For tolerances closer than .005% the Oscillator and Crystal must be purchased together. The Oscillator is factory wired, and the crystal custom calibrated for the specific oscillator.

For crystal prices consult table below:

TOLERANCE	200-499 KC	500-999 KC	1000-1499 KC	1500-1999 KC	2000-9999 KC	10,000-15,000 KC	15 MC-29.9 MC	30 MC-60MC
.01%	\$ 8.75	\$12.50	\$ 5.25	\$ 3.75	\$ 2.50	\$ 3.25	\$ 3.00	\$ 4.00
.005%	\$12.50	\$15.00	\$ 6.00	\$ 4.50	\$ 3.00	\$ 4.00	\$ 5.00	\$ 6.50
(.0025% and .001% tolerances are available only by purchasing the FO-1 Oscillator and Crystal together)								
.0025%	\$17.50*	\$17.50*	\$ 6.75*	\$ 5.25*	\$ 3.75*	\$ 4.75*	\$ 6.50*	\$ 8.50*
.001%	\$25.00*	\$25.00*	\$ 8.00*	\$ 6.50*	\$ 5.00*	\$ 6.00*	\$10.00*	\$15.00*
*Prices are for crystal only. To insure tolerances closer than .005% crystal must be purchased with oscillator factory wired and tested. For total price add \$6.95 to price of crystal desired.								

HOW TO ORDER: In order to give the fastest possible service, crystals and oscillators are sold direct. Where cash accompanies the order, International will prepay the postage; otherwise, shipment will be made C. O. D.

munications for the mile-and-a-quarter boat race qualification runs at Nelson Lake near Malta. This was a practice run for the Northwest Regional Championship Races to be held at Nelson Lake this fall. Traffic: (June) W7EWR 1.

**OREGON**—SCM, Edward F. Conyngham, W7ESJ—SEC: WAT. New appointments: PRA as RM, QKU as PAM. VBF and WAT are working nights and school days. KAB has been assigned to the swing shift. ZFD has left for Formosa. BLN has taken over as net manager of the Oregon Emergency Net. APF finds things looking up with a new final and no TVI. THX is running 2-meter cheeks from Astoria to Portland. The Salem Radio Club sponsored an OEN picnic July 10th. OEV is rushing construction of mobile equipment before vacation. A new YL Club is being formed in Portland with RVM, pres.; QKU, treas.; WN7ZIN, secy. Other members are REU, SPC, TVU, WFO, ZKY, and WN7WRA. The Oregon State Net reported 19 members, with 123 check-ins in 18 sessions, the highest being 11 in one evening. The Net now connects with RN7, WSN, OEN, and CTN. The Southwestern Oregon Radio Club held a picnic on July 24th with ERC, EUG, BLN, APF, PHG, QYS, VPF, UIH, SPB, AWT, OKM, TLQ, SCY, and UMZ attending. OKM rescued a Canadian car from going over a cliff on Seven Devils Road July 31st. VBF assisted in getting a tow car. We regret to have to report the passing of IEY to Silent Keys. QWZ, QEI, and FPD have taken NCS duty on several MARS nets. SEZ, BDU, and LI are organizing a 2-meter MARS net. WAA reported from Idaho while on vacation. AJN is off for an overhaul and modernization. Traffic: (July) W7APF 332, QKU 92, BLN 50, BVH 41, LT 26, THX 25, PRA 23, UJL 22, TIR 12, ESJ 8, NFZ 6, VDG 5, VJT 1. (June) W7ZFD 224, TIR 19, BDU 2.

**WASHINGTON**—SCM, Victor S. Gish, W7FIX—Nets: WSN, 3575 kc., 1900 PST Mon. through Fri.; WARTS, 3970 kc., 1800 PST Mon. through Sat. AWG joined Silent Keys Aug. 5th. Ten EC reports were listed on the SEC report received from RCM. JHX reports tests on horizontal vs vertical polarization on 2 meters. July brought the SCM a visit from 6GGC, San Francisco SCM, his XYL, and YL. It was very nice to meet Wally, Rose, and Rae. JPH now is mobile /Ø in Minneapolis. PGY reports bad conditions and a scarcity of traffic. VAZ ditto. VE7ASR (mgr. of RN7) was a visitor on Aug. 6th. UIN reports SVMI, of Colville, did a swell job as NCS helping out in the search for lost aircraft on July 30th and 31st. APS vacationed in VE7-Land. UYL reports the new QTH is noise-free. FZB vacationed to Yellowstone in August. LVB spent his vacation fishing. UQY is on all bands with 600 watts. AVM makes a negative report—no traffic, no 2-meter work. CWN had fun in the recent CD QSO Party. BMK has the mobile reinstalled and working. IOH completed the Chamberlain all-band transmitter and then sold his QTH before he had a chance to test it. The old QTH was sold to VLY, who had his rig on the air the first day. UQY reports 5LGG now is A7AIR in Spokane. CBE is on with a transmitter built by KZP. FIX is on again with an ART-13 unmodified except for power supply. The State Department of Civil Defense is trying to sign up all net members in the State to insure immediate operation in case of emergency. A good old-fashioned traffic slump this summer reminds us of pre-KA days. OE is building a new Heathkit AR-2. CCL activity is 100 per cent TCC. LWB's s.s.b. rig voice-controlled threw your SCM on his first try at it. It's time to get ready for the traffic season coming up. Traffic: (July) W7BA 954, PGY 839, VAZ 308, CCL 234, OE 87, UIN 49, APS 27, AIB 22, RXH 22, UYL 20, RCM 16, USO 16, EHH 11, FZB 10, PQT 10, WQD 5, HDT 4, LVB 4, UZB 4. (June) W7TIQ 14, EYF 7.

### PACIFIC DIVISION

**HAWAII**—SCM, Samuel H. Lewbel, KH6AED—The convention in Hilo was the biggest and best yet. For those who missed it, EM extended the invitation from the Maui Amateur Radio Club to all hams to attend the Territorial Ham Convention next year on their island. The Honolulu Amateur Mobile Club has started a drive for 100 per cent ARRL membership as well as 100 per cent AREC. The mobile gang is moving down to 10 meters for RACES frequencies, the first real activity on that band for a year or two. The v.h.f. gang is busy building antennas and still looking for that first Hawaii-Oahu 2-meter contact. WITU/KH6, now at KH6AJF, passed his Extra Class exam. Traffic: (July) KH6AJF 2207, QU 284. (June) KH6AJF 2459, QU 78.

**NEVADA**—SCM, Ray T. Warner, W7JU—SEC: WYQ, ECs: PEW, PRM, TVF, TJY, and ZT. OPSs: JUO and UPS. ORSs: MVP, PEW, and VIU. OBS: BVZ. Nevada State frequencies: Phone 3880 and 7268 kc.; c.w. 3660 and 7110 kc. TVF, of Las Vegas, who has been plunging away on Nevada QSOs, now has over 100 QSLs acknowledging same. The following recently received their "Worked 25 Nevada" certificates: 6PCA, 6SHY, VYC, and YAI. The Southern Nevada Amateur Radio Club now meets in the Victory Village Auditorium the 2nd and 4th Fri. of each month. TVF qualified for his 25-w.p.m. Code Proficiency certificate. OLF, of Elko, is active with a new

*"Worked 87 foreign countries, all continents and 30 zones" with a Gotham Antenna and 35 watts.*

## READ THIS AMAZING LETTER: How an inexpensive **FULL SIZE** Gotham Rotary Beam made it possible to "work the world!"

Gotham Hobby Corp.  
107 East 126th St.  
New York 35, N. Y.  
Gentlemen:

Florida, 1955

I'd like to express my enthusiasm and satisfaction regarding your 20-meter rotary beam antenna. I purchased one of your standard two-element units in February of this year. Prior to this time I had been using a collinear array about one wavelength above ground. The transmitter feeding this antenna had a power output of about 35 watts, and results were quite discouraging.

When my Gotham arrived, it was easily assembled in a couple hours. The same transmitter was used to excite the Gotham antenna, using the same power as before. Results have been quite gratifying, and it is interesting to note that in the three months since using the Gotham antenna, I have worked 87 foreign countries, all continents, and 30 zones.

I am able to keep schedule with amateur radio —\* in the Cape Verde I-lands every week. *It was impossible to even hear this station before using the Gotham beam.*

Extremely high winds are prevalent in this part of Florida. The Gotham beam has withstood blows in excess of 50 miles an hour without failure.

The elements bend almost double in these high winds, but readily return to their original configuration when the wind abates. I feel that this is an extremely important feature of the Gotham antenna.

I have enthusiastically recommended Gotham to all the hams who ask what type I am using (and most of them do, when I tell them the amount of power I'm using). I wish you every success with your product, and feel that it is well worth the modest price.

Yours very truly,

(Names and \*call letters upon request.)

### EVERY FULL-SIZE GOTHAM ROTARY BEAM IS ENGINEERED FOR SIMPLICITY, STRENGTH, PERFORMANCE

Your Gotham comes to you completely fabricated, made (except for the polystyrene insulator) entirely of new, rustless, first-quality mill stock aluminum. You'll find no link coupling, no complicated mounts, no tuning stubs. You get good, solid aluminum tubing—and more of it, in both length and thickness (the only true gauge of \$ value)! No flimsy wire, no wood to rot or weather-proof.

Easy assembly, simple and quick matching of line to antenna. Yet Gotham's price is 25% to 75% lower than the "toy" midjet beams which Gotham so easily out-performs.

Viking II. YRY, of Boulder City, is keeping Far East skeds in the wee hours of the A.M. with a Globe Scout. 6PWE, Peanut Whistle Eddie, has returned to Boulder City after an absence of almost 15 years. ZZE is an old-timer who has returned to the flock with a new call in Henderson. ARA, recently licensed, also is in Henderson. ZZH is the XYL of MBQ/K6BXK.

**SANTA CLARA VALLEY**—SCM, R. Paul Tibbs, W6WGO—Asst. SCM: Roy E. Pinkham, 6BPT. SEC: NVO. EXX reports that the PAARA did not hold its meeting in July. He keeps his OBS schedule on Mon., Wed., and Fri. at 1945 on 145.8 Mc. K6BBBD worked in the July CD Contest. Dick is installing mobile in the "new 47 Mercury." WLI reports a lack of 'phone stations in the CD Contest on that week end, both on 40 and 20 meters. AIT still is working traffic in NCN and RN6. ZRJ ordered a Heath VFO. FON still is active on the MTN 'Phone Net, acting at times as eastern traffic outlet. K6GID, mgr. of NCN, is calling for new members to check into the net from the East Bay, San Francisco, and Santa Clara Valley sections. This net serves as outlet at section level for the NTS. Anyone interested in traffic work can find much pleasure by spending an hour or so most any week night working in this net. HC reports that the higher nets of the NTS are doing quite well this summer in spite of QRN and skip conditions. A nice report was received from CUB with this dope. Dave runs a Viking Ranger working the following DX: SM, OH, OE, FY, G, DL, JA, VK, and more. Power was about fifty watts using a long-wire antenna. He reports CLS is moving back to Hillsborough setting up a KW-1 in the tool shed before starting his house. GCG climbed pine trees to string CLS's sky wire. Traffic: W6ZRJ 215, HC 94, FON 93, K6GID 76, W6AIT 22, BPT 22, CUB 19, K6BBBD 12.

**SAN FRANCISCO**—SCM, Walter A. Buckley, W6GGC—At the July meeting of the San Francisco Radio Club ATO gave a demonstration and exhibit of new commercially-built amateur radio equipment. BIP reported that Field Day was very successful; more than 100 contacts were tallied. With Dad's new call, KN6JUK, the Harlan boys now have a complete "ham family." Sons Harry and John are K6AES and W6OST. W6IKO and club treasurer Harry Witzke had a nice mobile vacation to Idaho. BSO, Father Bose, now is back on mobile operation. K6HYW sports installation on 6-meter mobile. KN6HIW and W6QMO represented the local ladies' club at the ARRL National Convention in Santa Monica. The HAMS (Red Cross group) and the Hi-50 Club say there have been lots of band openings on 6 meters lately. The 29ers invite all amateurs locally who have 10-meter installation in mobile to join them in monthly transmitter hunts. The 29ers held its annual breakfast July 24th at Fosters Restaurant with a good turnout. PKI is operating at Devenshire Uranium Supplies in San Carlos. PCN was hostess for the ladies' club at the July meeting and it served two purposes. The OMs also were invited and all enjoyed a housewarming at PCN's and GCV's new QTH. The Tamalpais Radio Club held its first after-summer session meeting on Sept. 9th. The Humboldt Radio Club had an ARRL membership drive with good results. GDV, YXQZ, K6CNV, W6BBW, K6CXB, KN6KGI, W6JSY, K6DVV, W6BJO, and JUH manned the c.d. headquarters station for the June drill. K6CNV now is a resident of Eureka. Congratulations to BIP, QMO, and GQA in coming in tops for the San Francisco Section in the July CD Party. OPL has a new QTH in Terra Linda. He requested more activity in ham radio for this section so will act as the new Asst. SCM along with Asst. GHI. JWF finished the new 100-watt Heathkit and expects to be on the air soon. CBE has the new pair of 4-125As final finished and working swell. He received MARS appointment and has been keeping daily skeds with mobile PKH on his Eastern trip. SWP, Pat Ryan, has been critically ill and will not be heard on the air for some time. He is in Ward 74-A, Oak Knoll Hospital, Oakland, Calif. His XYL reports that Pat may never be active in radio again. His many friends will be sorry to hear this as Pat was very active on the nets and a faithful worker. WB has accepted the assignment as chairman of the National ARRL Convention which will be held in San Francisco in '56. With Bud as top man the Convention is expected to be a huge success. Your SCM had a wonderful time meeting the boys of the "Grandpappy's Net" at the roundup in July at KUP's QTH in Ruth, Calif., and attended the Humboldt Radio Club meeting in Eureka and then on to the Oregon Emergency Net Picnic at Salem, Ore. A wonderful time was had and I enjoyed meeting 7SY (at the Salem OEN Picnic) and many of the other fellows I had talked to over the air. I also met that swell fellow, 7FLX, who does such a grand job editing the PAN News and enjoyed a steak dinner and dandy pie at K6AKF's and his XYL Madge's QTH. PHT now is busy doing remote-control radio broadcasting. Traffic: (July) W6QMO 93, GGC 32, BIP 8, GQA 5. (June) W6QMO 85, PHT 8, GQA 6.

**SACRAMENTO VALLEY**—SCM, Harold L. Lucero, W6JDN—With the coming of the cooler weather, also the end of most vacations, I believe the Official Appointments should be listed so that all will know who is who in the Sacramento Valley section. SEC: JEQ. Asst. SCMs: ZF, K6BMU, and TMP. ECs: K6AKF, BYS, CFZ, RXN, IVD, FKI, ULC, and KTB. OBSs: SBN, MWR, FNS, ILZ, (Continued on page 104)

*The Original*

# TILT OVER TOWERS

(Patent applied for.)

Devised and created by E-Z Way over 5 years ago. Often copied but never equalled.  
**TESTED AND PROVEN**

More than 15,000 satisfied users. "Ask the Ham who owns one." (Courtesy, Packard.) One of the sturdiest and most versatile towers in the industry. Don't send a boy to do a man's job. E-Z Way Towers are designed to support Rotary Beams—not just a lightweight TV antenna. We invite comparison.

## TILT OVER with Ground Post

Six types to choose from—40 to 65 ft. Built to support anything from a Mini-Beam to the heaviest. Cranks down and tilts over for quick, easy adjustment. No guy wires needed. Ground post is 3 1/2" steel pipe or larger.

Tower	Tower Hgt.	Price
GPRBD—40	38 ft.	<b>\$120.00</b>
GPRBS—40—45	38 ft.	<b>\$160.00</b>
GPRBS—50—60	48 ft.	<b>\$210.00</b>
GPRBS—60—65	58 ft.	<b>\$260.00</b>
GPRBX—50—55	48 ft.	<b>\$325.00</b>
GPRBX—60—65	58 ft.	<b>\$385.00</b>

## BUILDING ATTACHED

The six towers shown above are also available with a wall bracket and hinge for the base for attaching tower to the side of a building. Crank up and down.

BARBD—40.....	<b>\$ 95.00</b>
BARBS—40—45.....	<b>\$130.00</b>
BARBS—50—60.....	<b>\$170.00</b>
BARBS—60—65.....	<b>\$210.00</b>
BARBX—50—55.....	<b>\$265.00</b>
BARBX—60—65.....	<b>\$325.00</b>

Provisions to mount rotor inside top of tower. Bearings at A and B relieve all strain from rotor.

## BUILD IT YOURSELF

Go as high as you like with 20 ft. sections. 320 ft.?

### C-10

Width 10"  
Max. Height 120 ft.  
Guy Spacing 27 ft.  
Weight per ft. 4 1/2 lbs.  
Price (approx.) \$2 per ft.

### C-15

Width 14"  
Max. Height 200 ft.  
Guy Spacing 40 ft.  
Weight per ft. 8 lbs.  
Price (approx.) \$3.50 per ft.

### C-25

Width 25"  
Max. Height 320 ft.  
Guy Spacing 60 ft.  
Weight per ft. 20 lbs.  
Price (approx.) \$9 per ft.

Used extensively for VHF and UHF communication antennas. Two other sizes available. When maximum height and guy spacing are not exceeded, these towers will withstand a 60 lb. wind load.

Three types to choose from—40 to 60 ft. Ideal one-man installation for flat roofs or porches. Cranks up and down and lays over for easy antenna adjustment. No guy wires needed. Tower is locked in a V-bracket at top of gin pole.

GINRBD—40	<b>\$125.00</b>
GINRBS—40—45	<b>\$165.00</b>
GINRBS—50—60	<b>\$215.00</b>

## LAY-OVER With Gin Pole

**We pay freight charges on any towers shipped in U. S.**

Add 10% to prices shown for West Coast orders. All E-Z Towers have heavy dip-coated Goodyear Pliolite S-5 (rubber base aluminum enamel). Hot dipped galvanized available at extra charge. 1/8" aircraft cable 2000 lb. test used on D-40 towers. All other cable is 3/32 aircraft 2600 lb. test.

## FLIP OVER

80-100-120 ft.

## "FOR THE HIGH BOYS"

Gets you up in the air but Flipo is easily cranked down and flips over to adjust antenna. Easy to install, too. A real sturdy brute ready and willing to carry any load you wish to put on it. One of our finest towers.

FORBS—80.....	<b>\$300.00</b>
FORBS—100.....	<b>\$360.00</b>
FORBS—120.....	<b>\$420.00</b>
FORBX—80.....	<b>\$359.50</b>
FORBX—100.....	<b>\$433.50</b>
FORBX—120.....	<b>\$500.00</b>

## Write Dept. T for Catalog

When writing, please specify type of tower in which you are interested, height and expected antenna load, (make and model number if possible). This information is necessary to give you accurate advice.

# Eliminate those unwanted audio frequencies...

with a new  
**R. L. Drake**

**AUDIO  
BAND PASS  
FILTER**

**Model 587**

**\$12.95**

AMATEUR NET

The new R. L. Drake Audio Filter is an effective, easily attached accessory that connects between crystal mike and transmitter. Carefully designed for correct low and high frequency cut-off, this new Audio Filter will not change natural voice quality.

no insertion loss  
no controls  
no power required

RESPONSE		
Down	Low CPS	High CPS
3db	at 415	to 3100
20db	at 187	to 6700

- Effectively limits audio range to keep your signal confined to the proper channel.
- Better side band suppression on SSB.
- On SSB phasing transmitters, it enables the use of smaller capacitors in the power supply.
- Only 4" long x 1 1/4" diameter.
- No wiring. Fitted with mike connectors and 5 1/2" cable.
- Reduces acoustic feedback in PA systems.

See page 64 - July '55 QST

Improves the selectivity  
of your present receiver:

**QX'er**

Improved Q-Multiplier

Provides either a sharp peaked IF curve or deep rejection notch. Easily attached. For 455 kc. IF.

**Model 583**      **\$24.95 Amateur Net**

Also available for 915, 500 and 262 kc. IF.

Available from your distributor who handles Drake Filters. Ask him about other R. L. Drake amateur gear.

**R. L. Drake Co.** Miamisburg, Ohio

and K6AKE, OPSs: MWR and FNS. ORSs: CMA (who is now our RM), FYK, K6GL, ASX, W6SYY, and KTB. PAM: TYC. OESs: W6LSB and QAC. OOs: K6ER, W6ILZ, FNS, FYK, BIL, KTB, and K6EHT. The recent boat race from Stockton to Redding, Calif., was well supported using mobile and fixed equipments . . . notes sent QST. Hats off to all who participated and did a grand job. The Feather River Amateur Radio Club is now 100 per cent ARRL; also the Tehama County Amateur Radio Club boasts the same. This is wonderful and it looks like our section is growing. K6ER is back from a fine vacation. TYC is going to resign as PAM because of his work. Sorry to hear this, Jack, but thanks for your hard work and we will see you on from time to time. JRY is attending PT&T Radio School. IMH moved to Berkley, K6BCW is now ruled by his XYL. Congratulations. QJD has a new mobile. HNL has a new sky wire. JDN was made Alt. NCS on MARS. I would like to have all clubs send me news of their activities so that I can be more fair in the reporting each month. Thanks, fellows. CU next month with more news. Traffic: W6CMA 114.

**SAN JOAQUIN VALLEY** — SCM, Ralph Saroyan, W6JPU — PSQ has a 10-A. KN6LLF has an RME-45 and is on 80-meter c.w. K6GBS is with Western Electric as a field engineer. QOS has a new harmonic, a girl. Congrats! LOS is heard on 75-meter s.s.b. NAS and NCG are on 2 meters with model 26 teletypes. JXY is sporting a 20-meter beam. UJU is rebuilding his SX-88. OWL is on 20 meters with a new beam. K6GTI is building a ham shack with house attached. PPO has a new Phasemaster and likes it. K6CBQ is on mobile with Carter modulator. The Fresno Radio Club gang did a bang up job on the Cerebral Palsy Telethon. The Club received a trophy "for magnificent help on 'celebrity parade' united Cerebral Palsy." JUK has an FB patio at the new home. SNF is heard on 75 meters with a wicked signal. NBP is with Uncle Sam in the Air Force. K6BGK has a loop for 75-meter hunts. ONK is chief in charge of 2-meter repeater for the Fresno Area and reports very good progress. TTX won a \$800 scholarship. PIQ is now in Alabama. KN6MQV is a new ham in Rosamond. K6GMQ now is Technician Class in Mojave. How about a report from down south and from up north, fellows? We received only one report this month. Traffic: W6TTX 496.

## ROANOKE DIVISION

**NORTH CAROLINA** — SCM, Charles H. Brydges, W4WXX — SEC: ZG, RM; VHH, PAM; ONM. Congrats to LEV on making BPL in June. VFK received his Globe King and is burning up 75 meters. GNF, the Greensboro Club, is looking at new club locations. NIHW, in Greensboro, has been busy with the RACES program. TAJ has worked over 100 European stations. KN4DXI is a new Novice in Greensboro. CVX received cards for WAC and is busy on 75 meters with the teen-age net and on 20 meters with DX. The Confederate Teen-age Net has over 30 members and covers six states. You older fellows are invited to call in anytime. BUA and CZR had a good time operating CZR/4 at Cherry Grove Beach. Nearly 200 attended the Charlotte Swap-Fest held in the Army Reserve Training Center. Welcoming speeches were presented by the Army, the SEC, and the SCM. GHS is busy working on YLCC. Since most of us are emergency-minded and engaged in emergency planning, publicity is one of our most important problems. If you will give the city editor of your local paper the basic material on club activities and the like he will be more than glad to put the information in the paper, and this will go a long way in getting the public to know you and your purposes much better. The Winston-Salem gang still meets on 3805 kc. every Sat. If any of you are in the Winston Area, don't fail to call in on 3805 kc. If you want call letter plates for your car send your application with a money order for one dollar to the Motor Vehicles Division, State Capitol, Raleigh, N. C., by Nov. 1st. Please include your name, address, and call on the return address portion of the envelope. ZQB is now high power mobile using an ART-13. MDA is on 2 meters. KN4ADT is really working the DX on 15 meters. EOU has a new Viking II. K4EAR is ex-5ETV from New Orleans. EJP has a new 150-ft. long wire and is working 'phone and c.w. on all bands. WN4HPJ is back in Blowing Rock and working on exams. BUW is trying to get a BC-454 installed in the car. ZH is on 40-meter 'phone with a new 40-meter beam. NIHW has a new 200-watt 2-meter rig with 24Gs in the final. Traffic: (July) W4RRH 50, GHS 30, BUA 14, CVX 12, AGI 8, ACY 6, GJD 4, EJP 2. (June) W4LEV 794, BUW 20.

**SOUTH CAROLINA** — SCM, T. Hunter Wood, W4ANK — ZIZ reports that much of his traffic is relayed by MARS. IMG reports that the Columbia paper carried a new story about ham radio in which was featured HDR, who has earned and has received the BPL medallion for handling enough traffic to make BPL three times. The following are members of the South Carolina MARS C.W. Net: ANK, ET, FFH, DYP, IMG, PLX, YOII, LSD, AWY, CHD, WSA, and UOQ. Many South Carolina hams attended the Augusta-Camp Gordon Hamfest on July 23rd. It was necessary to prepare this report early this month, therefore few activity reports were received in time.

## mosley

### "Ten-Twenty"

TRUE BEAM PERFORMANCE on both 10 and 20 Meters . . . and all you do is change bands at the transmitter!

Two peak-pretuned 3 element beams, interlace mounted on one boom, give you real DX action! The Exclusive *Auto-Electronic* Coupling—that permits feeding both beams with just one coax line—means Unequalled operating convenience! The story, below, will tell you why Your Best Beam Buy . . . is the New "Ten Twenty"!

#### SPECIFICATIONS and DATA — Model VPA-1020

Forward Gain (over full size dipole): 7.5db.

Front-to-Back Ratio: 28db.

S W R: 1.5/1, or better, at resonant frequencies.

(Performance data essentially the same for both ten and twenty meter operation.)

Elements: 61ST6 Tubular Aluminum. Maximum length, 22½'.

Boom: 1½" OD 61ST6 Aluminum. 12' long.

Wind Surface Area: 11.4 sq. ft.

Wind Load: 228 lbs.

Weight (Assembled): 57 lbs.

Tuning: FACTORY PRETUNED to three resonant frequencies in each band. Drilled and color coded element sections.

Model VPA-1020, complete with "V-P" Coils, Auto-Electronic Coupling Yoke, all necessary hardware and full instructions. Less mast, rotor and coax line.

AMATEUR NET PRICE

\$120.79

### New! Mosley Loading Coils

for 40, 75 & 80 Meter

### 'Vest Pocket' Dipoles

Not enough space for a "long wire"? — Here's the answer! Use a MOSLEY 'V-P' Dipole Loading Coil to make a high performance dipole antenna at about one-half the length of a full size dipole. Just one coil needed for each antenna. Use 52 or 75 ohm coax.

Model No. 40-D  
40 Meter Coil  
Net Price \$7.95

Model No. 75/80-D  
75 or 80 Meter Coil  
Net Price \$7.95

### Every MOSLEY Product Advertised . . .

... is AVAILABLE NOW!

Mosley manufacturing and shipping facilities are being constantly expanded to keep pace with the ever-increasing demand for popular "Vest Pocket" Rotary Beam Antennas and other Mosley Amateur equipment.

Every Mosley product advertised is in production and readily available through your Ham Equipment Supplier.

## Mosley Electronics, Inc.

8622 ST. CHARLES ROCK ROAD, ST. LOUIS 14, MISSOURI

**7**HIS LATEST REVISION of one of the most popular publications in the Radio Amateur's Library is packed with accurate, up-to-the-minute information concerning antenna theory, design and construction.

**L**OOKING for information on mobile whips or planning an elaborate beam to snag those rare DX stations? From basic theory to how to build 'em, horizontals, verticals, rotaries, fixed beams, transmission lines, together with dimensions, photos, drawings, radiation patterns, you'll find the information in this new edition. Better pick up your copy now.

THE AMERICAN

RADIO RELAY LEAGUE, INC.

WEST HARTFORD 7 CONNECTICUT

Late reports will be included next month. Traffic: W4FFH 99, ZIZ 97, ANK 5.

**VIRGINIA** — SCM, John Carl Morgan, W4KX — This report was written in August when usually there is little to tell about because of summer doldrums. But in spite of very persistent QRN, record high temperatures, etc., the nets have been perking nicely and there has been lots of other activity. VFN and VN members cooperated in the AREC "Hurricane Drill," which is designed to prevent the haphazard operation which obtained last year. Following the drill, the Tidewater Mobile Club had an FB picnic. VFN also furnished communications for the Old Dominion Motorcycle Road Run. The Rappahannock Club furnished communications for the Fredericksburg Soap Box Derby. The Shenandoah Valley Club played host to some 180 hams and families at the 4th Annual Dickey Ridge "Fest." BLR reports on a fine YLRL picnic on Skyline Drive. TFZ says ODN has added a Saturday session, and YKB reports formation of the new Late Evening Net on 3820 kc. K4ASU earned a BPL medallion by the "originations" route, and has issued the first edition of the VN Directory. NQV is off to England and Cambridge on a National Science Foundation Fellowship. There are new harmonics at TVO/SIE and also at OWV, who reports the first words were "CQ" off frequency but 5 by 9. IA and TFX are ensconced in the new QTH at Warrenton, and KFC is trying to improve his notoriously puny signal by moving to a 20-acre antenna farm at Clifton, Va. YE, YZC, and KN4CAX also are about to break in a new wigwam in Fairfax County. 3WDP and K2KNN are taking turns chasing traffic and DX from K4MC. KX is off the air rebuilding. Dampness in the basement blew the final, so we have a new dehumidifier. LW now is in the new QTH with a Lyseo 600 rig and linear final. EBH now is trying a new 37V all-band vertical, and first reports were very FB. RTV is trying to outdo HQN with a "plumber's nightmare" mobile antenna. Traffic: W4PFC 685, K4ASU 266, W4CGE 232, K4MC 108, W4BLR 37, YKB 37, YZC 26, WBC 14, KN4CNP 8, W4APM 4, OWV 3, KFC 2, IA 1.

**WEST VIRGINIA** — SCM, Albert H. Hix, W8PQQ — SEC: GEP. PAM: GCZ. RMs: GBF, DFC, HZA, and JWX. It is with sorrow that I announce the passing away of Ed Lockhart, sr., NAM. New Novices in Princeton are CXV, BFG, BIK, ADG, AGK, and DSK. Recent Novices in the St. Albans-Nitro-Dunbar Area are UQP, TVK, VBD, ADD, TVO, BOZ, and CUK. I would greatly appreciate receiving more activities information. For those who desire reporting forms, please request same by dropping me a post card. The Princeton Club has resumed regular meetings on the 1st Fri. of each month at 8:00 P.M. at the City Hall. LSG has a new B&W 5100. NLT has a new 20-meter beam operating. The W. Va. C.W. Net maintained excellent activity participation during summer months. CLX has an s.s.b. rig now. Traffic: (July) W8KXD 89, HZA 40, JWX 35, NYH 21, PZT 12, BWK 9. (June) W8JWX 31, BWK 22, NYH 9.

## ROCKY MOUNTAIN DIVISION

**COLORADO** — Acting SCM, Carl L. Smith, W0BWJ — The value of AREC preparedness and training was emphasized to Colorado during the flood of last May. Special thanks are due NVU and his wife for going on emergency stand-by before the disaster struck, and for operation during the entire period. Mac, Milt, and Dave of K0WBB were at the scene with emergency equipment. Excellent work was done by KQD, SUP, IUF, ICR, PGN, OIQ, WIR, and K0ANZ in handling traffic coming out of the area. Congratulations to all for a job well done. The Sky High Radio Club held a picnic at Monte Vista and all attending had a fine time. MYX had BDR and his wife, from Iowa, as guests. A picnic was enjoyed by the families of KQD, BDR, and MYX with traffic the subject of a big ragchew. LZY is on 7094 kc. at noon on Tue., Wed., and Fri. with the latest Official Bulletins. SGG has 15 watts 'phone and c.w. on 6 meters; he and SWS are hoping to get some activity going. Anyone interested? CSSN (slow-speed net) meets Mon., Wed., and Fri. at 1715 MST, resuming operations on 3570 kc. Oct. 3rd. Former members and newcomers invited. In the meantime, all c.w. operators are urged to check in to the High Noon Net — there's plenty of activity for you. During July the High Noon Net handled 191 messages in 19 sessions. Late BPL credits: K0WBB March, April, and May; KQD April; TVI April, ANZ April; NVU May, and LO/0 May. Amateurs in Colorado, New Mexico, Wyoming, and western portions of Kansas, Nebraska, and South Dakota are invited to take part in a QSL card contest being held until Nov. 30th. Full details are available from Rapsco, 1237 16th Street, Denver. Traffic: (July) K0WBB 639, W0KQD 414, IUF 52, OGO 29, BWJ 21, HOP 17, NVU 16, UNAL 14, YMP 14, PGN 12, SWK 12, W5WDK/0 11, W0AGU 9, SKK 9, NWJ 7, YNC 6. (May) K0WBB 997, W0LO/0 302, NVU 194. (Apr.) W0KQD 765, K0WBB 728, ANZ 712, W0TVI 240. (Mar.) K0WBB 695.

**UTAH** — SCM, Floyd L. Hinchaw, W7UTM — Vacation time still is with us, judging by the lack of activity this

## THE *ALL NEW* COMMUNICATIONS RECEIVER

- FEATURING:**
- Six bands covering .54 to 31 Mc.—AM, CW, MCW, and FS with appropriate FS converter.
  - Accurately calibrated main tuning dial plus auxiliary dial with full Electrical bandspread.
  - A ferrite transformer provides accurate antenna matching for 75 ohm unbal. and/or 300 ohm balanced inputs.
  - Sensitivity: 1 (one) microvolt or better for 10-1 signal to noise power ratio, 1.5 to 31 Mc. Less than 5 microvolts for .54 to 1.5 Mc.
  - Image Ratio: Better than 60 db.
  - Selectivity: Variable in 6 steps from 200 cy to 5 KC, 5 crystal and one non-crystal positions.
  - Input: 105-125VAC 50/60 cy., approx. 90 Watts—6V.-6A. and 250VDC-.1A.
  - Output: 4, 8, 16, 600 ohms, 2 Watts high quality audio—better than 60 db hum level.

- Highly effective noise limiter—Calibrated "S" Meter—Dial locks.
- Specially designed Audio Selectivity control with variable bandwidth.
- Diversity operation is available with the GPR-D. Provisions for external control for HFO, BFO, IFO.
- SSB Coaxial IF output & Audio input.
- Cabinet or rack mounting . . . 52 lbs. . . 20" w. x 10" h. x 15" d. (Cabinet.)

### Tube complement:

- 6AB4 Grounded grid input RF amp.
- 6CB6 2nd RF
- 6AU6 1st converter
- 6AG5 Oscillator
- 6BE6 2nd Converter and Oscil.
- 6BA6 IF Buffer Amp.

- 3-6BA6 IF Amplifiers
- 6AL5 Det./Noise Itr.
- 6AG5 BFO
- 12AX7 Avc and Audio Amp.
- 6V6 Output
- OA2 Regulator
- 5U4G Rectifier

Bulletin 179B for complete details.

**THE TECHNICAL MATERIEL CORPORATION**  
MAMARONECK, NEW YORK. OTTAWA, ONT., CANADA

# ARROW . . . For a Complete Stock of HAM GEAR!

**No. 90672  
ANTENNA  
BRIDGE**

The Millen 90672 Antenna Bridge is an accurate and sensitive bridge for measuring impedances in the range of 5 to 500 ohms at radio frequencies up to 200 mc. It is entirely different in basic design from previous devices offered for this type service inasmuch as it employs no variable resistors of any sort. The variable element is an especially designed differential variable capacitor capable of high accuracy and permanency of calibration over a wide range of frequencies. A grid dip meter such as the Millen 90651 may be used as the source of RF signal. The bridge may be used to measure antenna radiation resistance, antenna resonance, transmission line impedance, standing wave ratio, receiver input impedance and many other radio frequency impedances. By means of the antenna bridge, an antenna matching unit may be adjusted so as to provide the minimum standing wave ratio on the radiation system at all frequencies.

**\$45.00 Amateur Net**

**MILLEN 90651  
GRID DIP METER**

The No. 90651 Millen Grid Dip Meter is compact and completely self-contained. Has seven calibrated uniform length scales from 1.5 mc to

300 mc plus an arbitrary scale for use with the 4 additional inductors available to extend the range to 220 kc. . . . . **\$61.50**

## MILLEN One Inch MINATURE SCOPE

— Panel Mounting  
— Instrumentation Use

Only 2 3/4" square by 4 1/4" long; excellent for modulation monitoring; FSK, plus a wide variety of monitoring applications in place of usual panel instruments.

No. 90901, with scope tube. . . . . **\$33.90**  
As above, less scope tube. . . . . **\$21.00**

TRADE-IN OFFERS ON NEW EQUIPMENT**

**ARROW ELECTRONICS INC.**

83 CORTLANDT ST.,  
NEW YORK 7, N. Y.  
DIGEST 9-4714

month. Even 2 meters seems deserted when compared with the winter months. SAZ has his receiving gear for 2 meters complete and will have his transmitter by fall. STC is busy servicing commercial communications equipment, and is heard only occasionally mobile in the southern part of the State. LQP has a new Buick and now must change to 12-volt gear. MWR has a good signal on 75 meters again, after having had a siege of transmitter trouble with his big rig. LQE is faithfully NCSing the Utah MARS weekly drills; but thunderstorm QRN has given him plenty of trouble.

**WYOMING**—SCM, Wallace J. Ritter, W7PKX—The Annual Wyoming Hamfest was a big success with a record attendance from six states. The Casper Club will sponsor the 1956 Hamfest. HDS is going strong on the Wyoming Weather Net at 0700 MST on 3925 kc. getting much-needed information for the U. S. Weather Bureau. NII is checking in regularly with Jackson weather. Welcome ZUC, at Encampment, to the Wyoming nets and 75 meters. ACG has been appointed as SEC. All ECs, please cooperate. TZK and PAV reported a plane crash, fatal to two, at Alva, Wyo., via amateur radio to CAA. The Cheyenne Club held a picnic. PKX received a Public Service Award for assistance in the Belt Creek, Mont., Flood. JFN is moving all over Wyoming getting 59 reports with a fishpole antenna. AXG and NII attended the Big Springs Annual Hamfest. ØBDR, the SCM of Iowa, walked away with the c.w. speed prize at the Wyoming Hamfest. NVI is handling the Pony Express Net on Sun. mornings in fine shape while the regular NCS takes a rest. NVI was heard to break the WX Net one morning and frantically inquire how to milk a goat. YSF is running higher power and has a much better signal. Your SCM wants more news from local clubs, etc., and is looking for QO applications. Traffic: W7HDS 104, PKX 97, YSF 74, PAV 59, TZK 43, NII 37, MNW 31, AXG 29, AEC 23, NVI 10.

## SOUTHEASTERN DIVISION

**ALABAMA**—SCM, Joe A. Shannon, W4MI—SEC: TKL, PAM; WOG, RM; KIX. Several clubs have announced election of new officers: Montgomery: IWX, pres.; AZX, vice-pres.; K4AJZ, secy.-treas. Huntsville: GEQ, pres.; NKX, vice-pres.; K4BFT, secy.-treas.; HHU, act.; KPD, training. Tuscaloosa: HFK, pres.; KN4DSR, vice-pres.; KN4CFD, secy.-treas. Birmingham: UEI, pres.; HVH, 1st vice-pres.; BMV, 2nd vice-pres.; KNW, secy.-treas.; YEP, rec. secy. USM reports that UJJ is back on the air at Auburn. ZSH has had a bucketful of rig troubles, all of which apparently are all smoothed out now. WOG continues to snatch some good DX on occasions and he, DFE, HKK, and MI are suffering through reinstalling mobile gear in new cars. DTT has joined the mobile ranks while CJA and K4AYR are busy getting Vikings (mobiles) installed. K4AOZ, W4TWK, and HFK are now mobile. DXB says that after all these years he now is VFO and can slide around. HPZ, in Cullman, now is General Class. K4BSV operated portable from NG summer camp at Camp Shelby, Miss., with good results. TXO reports that he gradually is converting the BC-669 to all-band operation. Traffic: (July) W4COU 426, UHA 149, HKK 115, KIX 62, WOG 53, YRO 44, ZSQ 37, DTT 33, DXB 31, EJZ 24, YAI 18, TWK 14, RLG 13, K4BSV 12, TXO 6, USM 6, K4AOZ 4, W4CRY 4, ZSH 4, TKL 2, RTQ 1. (June) W4COU 434, UHA 431, ZRZ 65, WAZ 16, RLG 14, YAI 13, YDU 2. (May) W4YAI 32. (Apr.) W4YAI 61.

**EASTERN FLORIDA**—SCM, Arthur H. Benzee, W4FE—Thanks to everyone who voted in this election. The large number of ballots cast indicates a healthy interest in League affairs. Your responsibility does not stop there; it is only by concerted effort, everyone pulling together, that we can maintain the high rating this section has enjoyed for some time. Get your reports into the mail promptly. If you do not have cards, ask for them. Do not hesitate to call on me for any assistance. I shall be only too glad to help where I can. PJU is touring the West and will return in October. FWZ reports lightning damaged his station and antenna but they now are back in service. Lake County: LARA 1955 officers are SXJ, pres.; FE, vice-pres.; VDY, secy.; YUT, treas.; YAN, act. mgr. The club auxiliary power unit is in operation. K4ABV and W4HZU are now General Class. VDY has a second call at his store, K4ECF. New Novices are KN4s EAD, EMB, and EJW. Another class is under way. 29,560 kc. is monitored daily. Miami: The Florida Hurricane Net began operation July 24th. The net call is HN and the net manager is YJE. The Net meets Sun. at 0700 EST on 3695-kc. c.w. alternate frequency 7125 kc.; also 3975- and 7270-kc. phone. Jacksonville: The YLs and XYLs had a half page in the July 21st issue of *Times-Union* with pictures, courtesy of YNY. The Coastal Emergency Net has been set up covering Key West, Fla., to Norfolk, Va. Net Control is VSX-HHO. The Net will be activated in the event of disaster in that coastal area. DES passed away Aug. 3rd. Traffic: (July) W4PUJ 326, WS 64, IM 47, ZIR 38, FE 28, FJE 26, FWZ 12, FSS 10. (June) W4ZBA 145, FJE 20, EHW 7, AHZ 4.

## QST BINDERS

As *QSTs* get older, they become more valuable. Are your 1955 copies scattered sloppily about the shack? If so, it's time to store them neatly as the year end approaches — and the best way to accomplish this is to file them in *QST* Binders.

Finished in reddish-brown fabrikoid with stiff covers, each Binder holds twelve issues of *QST*, opens to any page and lies flat. Your copies are protected and always available for easy reference.

Each — \$3.00 (postpaid)

Available only in U.S.A. and Possessions

AMERICAN RADIO  
RELAY LEAGUE, Inc.

West Hartford 7  
Connecticut

**WESTERN FLORIDA** — SCM, Edward J. Collins, W4MS/RE — SEC: PLE, ECs: MFY and H1Z. K4AKP is proudly exhibiting a BPL medallion. WN4HBK passed his General Class exam. KN4CLJ has a new transmitter. KN4CLK received a direct hit on the rig by lightning. AXP is sporting a new Lancer car. MUX is home again and building a beam. PAA is operating all bands. QK has an FB VFO perking for net work. KN4EEG is the newest ham in Pensy. CRK is heard calling DX. CCY is tuning the beam to the last watt for DX. BGG is doing antenna work. KN4ADY is looking at a new trailer for beam location. GMS has a new beam on 15 meters and is becoming a DX hound. HJA has the finest mobile set-up in the area. EAR has improved the audio 100 per cent. UCY is really enjoying 10 meters now that it opens regularly. PQW is working on the mobile gear. BIJ has a new v.t.v.m. Ex-PN promises to get a new ticket after a 20-year layoff. FHQ spends his operating time on c.w. K4ABI is going West soon. ZFL still is mobile bicycle. KN4AEP is going after General Class. YRF is looking for contacts with his brother in DL-Land. MS is enjoying s.s.b. and is dusting off the 50-Mc. gear. JPD still prefers 40 meters. DDD went up for General Class. YES is giving the DX-100 won at the Pensy Hamfest a workout. How about some reports from the rest of the section?

**GEORGIA** — SCM, George W. Parker, W4NS — SEC: CFJ. PAMs: ACH and LXK. RMs: MTS and OCG. It is with much regret that we accept the resignation of OPE as SEC. Abbott has done an outstanding job in this office, and we are very sorry that his job will make it impossible for him to continue. However, we were fortunate in securing the services of CFJ, of Atlanta, to fill the vacancy. We have every confidence that Bill will carry on with the work Abbott has so well begun. DX-100s are sprouting all over Atlanta. They can be found in the shacks of NS, NQO, FII, SWZ, and TJS. The Atlanta Radio Club's classes, under ZD, MTS, and KOR, graduated a group of Novices last month. Those receiving calls were KN4s DHN, DNI, DNL, DNS, DMX, DMY, DNR, and DOI. FZO is putting up a quad for 20 meters. BWD attended the Pittsburgh Hamfest while on vacation. BYJ, UJM, YWP, and MNJ are back on the air after a siege in the hospital. KN4ANZ has a new Globe Scout. KN4DKM has an AT-1 on 80 meters. LNG still is in the Army and is not too active. IPL has two new 75-foot poles, and is putting up a 10-15 beam. WKP has a new 15-meter beam above his 10-20 array. A new club is being formed in North Georgia. If you live in the vicinity of Rossville, contact BGB. FZO has an 813 rig on 80 and 40 meters. With the return of cooler weather your SCM hopes you will include a little more news with your reports. Traffic: W4OCG 234, PIM 183, HYV 44, NS 36, HYW 28, ZD 20, MTS 18, FZO 12, BWD 4, BYJ 4, BXV 2.

**WEST INDIES** — SCM, William Werner, KP4DJ — SEC: JM. JM, our new SEC, requests cooperation in making a bigger and better AREC organization. The first hurricane alert of the season found the Net ready with one station in each town with an available source of emergency power. WT acted as NCS of the 3925-kc. Net several times in the past month. ZC moved to Caguas. W4HZ, operating /KP4 while awaiting a new call, uses 32V-1 and SX-28. PW is on active duty with the National Guard. CG, DO, DV, JZ, and ZC were heard operating mobile. ACZ received his license July 20th and is on s.s.b. Please note the s.s.b. frequency for KP4 is 3850 kc. W2NIJ is the outlet for KP4 traffic on 14,280 kc. FI has completed his kw. transmitter and a three-element 20-meter beam. PZ built a two-element 20-meter beam. KP4ID/KP4, at the c.d. office in Rio Piedras, boasts a new Onan emergency power plant because of the efforts of MP. Police headquarters at Arecibo, Aguadilla, Mayaguez, Ponce, Guayama, and Ilumacao have made their 5-kw. emergency power plants available to amateurs. The power company at Mayaguez offered 11G the use of its 3-kw. emergency power plant. The Antilles Net on 3815 kc., KP4YX NCS, was activated each two hours during the hurricane alert. UII, at Sabana Seca, has Navy emergency power. GP, Arecibo, has his own 500-watt power plant. DV operated on his own 1½-kw. power plant when the main power failed. The Cuban Emergency Net has announced it will contact the P.R. Emergency Net on 3925 kc. during the present hurricane season as well as on 20 meters during the daytime. EE promises more activity on 75 when he gets the antenna up. ZW reports zero traffic since the ban on DL4 traffic. DV is MARS. Traffic: KP4WT 174, DJ 3.

**CANAL ZONE** — SCM, Roger M. Howe, KZ5RM — SEC: WA. ECs: JD, RV, and QA. RM: DE, PAM: DG. A farewell party was given for KZ5JD at the July meeting of the CZARA. He will make his new home in Venezuela. GF, our QSL Manager, is leaving for a vacation in the Catskills. While he is away RM will take over the files. Organization plans are under way by the ECs to register as many stations as possible for participation in civil defense exercises as members of the Canal Zone AREC. Already 21 operators in the Central and Pacific Areas and 5 from the Atlantic Area have indicated willingness to participate. The traffic circuits between Corpus Christi and the Canal Zone carried news recently of the successful arrival of the eighth baby since Squadron 45 has been

(Continued on page 112)

# QUALITY PRODUCTS

BY **B&W**

## MATCHMASTER

Three valuable instruments in one, with features enabling you to make fast and reliable measurements on coaxial feed lines, antennas, and transmitting equipment. As a dummy load it permits tuning and adjustment tests without putting a signal on the air. As a direct reading r-f wattmeter it enables proper adjustment of circuit elements and voltages for maximum power output. As an integral SWR bridge it helps in adjusting coax feed lines, antenna tuning networks, etc.

## SINGLE SIDEBAND GENERATOR

The 51SB generator offers sparkling SSB performance with your present B&W, Collins, or Johnson transmitter, on 80 through 10 meters with the output frequency control presently in your transmitter.

ALL OF THESE FINE B&W products are available at leading distributors' everywhere.

## 1 KW PI-NETWORK TANK COIL

A high-power integral bandswitched pi-network tank coil for maximum efficiency from 80 through 10 meters. For Class "C" or linear operation. Minimum "Q" of 300 over entire operating range.

## AUTOMATIC T - R ANTENNA SWITCH

Fully automatic electronic antenna change-over from receiver to transmitter and *vice-versa*—suitable for all power applications up to the legal limit. Model 380 is ideal for voice operated SSB—AM phone and break-in CW—all with one antenna.

## SINGLE SIDEBAND RECEIVING ADAPTER

Truly selective band-pass type adapter converts any receiver with an IF between 450 and 500 kc for true single-signal CW reception, selective sideband AM reception, superb performance on SSB.

## TOROIDAL SSB BANDPASS FILTER

A reasonably priced highly selective filter. Amplitude characteristic relatively flat for nominal 3.0 kc passband. Provide sharp skirt selectivity *both* sides of the bandpass region.

## ANTENNA INDUCTORS

Provide maximum efficiency as link-coupled antenna coils for medium and heavy-duty service. Available for power outputs from 100 watts up to 1000 watts.

away for two months from Coco Solo. New local licensees are KZ5s AD, DH, GB, MM, and RU. Traffic: KZ5NM 258, VR 230, WA 130, LM 54, FL 12.

### SOUTHWESTERN DIVISION

**LOS ANGELES** — SCM, William J. Schuch, W6CMN — SEC: QJW. RMs: BHG and K6DQA. PAM: PIB and YVJ. Summer vacation took its toll, with the gang scattering from here to breakfast. K6BEQ is questing W8AWM about town. NTN put up a 7-Mc. vertical and is DXing. AM vacationed in KL7-Land and worked 5 countries from there. K6ELX vacationed in Mexico as XE1PAC. K6IQF joined the traffic boys. K6KCI assisted with the radio class at summer school. K6HOV has an AF67 and an Adventurer. K6COP now is 144 Mc. TDO is dividing time between 3.5- and 144-Mc. traffic. K6EA still is painting and polishing the shack. K6DQA is looking for help at the County Fair booth. K6EJT is going East for three months. GJP is moving to Oroville. USY has a new 14-Mc. beam and is looking for long-haul traffic. LYG furnished contact for a boys' camp. GYH snagged VP8BD on 14 Mc. LDR is trying to crawl out from under accumulated work after vacation. The Tri-County Amateur Radio Assn. will have a booth at the County Fair. K6JHR is working 21-Mc. c.w. K6HBA has a long wire on 3.5 Mc. NJU is putting up a 60-foot tower and 14-Mc. beam. K6IYF is busy on the Mission Trail Net. HBT has a parakeet that calls CQ. K6IOX and KN6IAV handled traffic for summer camps. K6HMB was on a ranch for the summer. BUK has 21- and 28-Mc. beams. Why not attend the many hamfests this year and meet some of the gang? New officers of the Rio Hondo Club are TTN, vice-pres.; and K6GJU, secy. K6IRY is on 50-Mc. K6HSN is putting up a beam for 50 Mc. K6IMF is mobile with a Globe Scout. K6CHN is 4-Mc. mobile now. The July 24th "assist" given the D.A.C. Sports Car Club "Ken Farrar Rallye" by the ARA of Long Beach was a success with 14 mobiles and four fixed stations at strategic locations doing a great job, as noted on appropriate plaques given in appreciation. Participating were DQD, OZS, UPK, GAU, QPB, GKM, PZV, KTS, CUG, GUD, TTX, KMJ, RUC, UPL, ROP, 9MDS/6, K6CPX, AVQ, CBN, KNP, and ABG. Traffic: W6GYH 304, LYG 118, USY 105, K6EJT 96, W6BHG 86, K6DQA 85, EA 74, HOV 68, W6TDO 56, K6COP 46, KCI 25, W6CMN 14, CAK 12, K6IQF 12, W6ORS 12, K6ELX 9, W6CBO 6, AM 4, NTN 2, K6BEQ 1. (June) W6TDO 69, MLZ 19.

**ARIZONA** — SCM, Albert H. Steinbrecher, W7LVR — Asst. SCMs: Kenneth P. Cole, 7QZLH, and Dr. John A. Stewart, 78X. SEC: VRB. PAM: KOY. Arizona 'Phone Net: Tue. and Thurs. 7 P.M. MST 3865 kc. Arizona C.W. Net: Tue. and Thurs. 8 P.M. MST 3690 kc. The outstanding event of July was the Powder Puff Derby. While we do not have a complete list of all Arizona participating stations, we know that a great number of messages were handled by Arizona operators. In Tucson, UVR was located at the Municipal Airport as a 75-meter outlet, and was assisted by LAD, MQE, and QHD. Of interest to Novices and Technicians around the State, there now is an organization called the National Novice-Technician Association (NNTA). The appointed head of the W7s is WN7ZSE, Barry Joseph, 4542 East 20th St., Tucson. This organization will maintain a QSL Bureau for Novices; and self-addressed stamped envelopes should be sent to the above address. Write to Barry for further information. HUV received his WAT (Worked All Tucson) certificate. LOC was issued the first WACA (Worked All Central America) certificate to any W Station, and LVR received his WBE (Worked the British Empire) certificate. Traffic: W7UVR 20, LVR 7.

**SAN DIEGO** — SCM, Don Stansifer, W6LRU — The fourth edition of the *San Diego County Amateur Directory*, a project sponsored by the Coronado Radio Club, is off the press and available. More than 1600 amateurs in the county are listed in this fine book. YDK is building an 18 half-wave Sterba curtain directed on the Far East. New officers for the Convair Club are UKU, pres.; K6GIX, vice-pres.; K6AIF, secy.; and K6CZF, treas. GVK has a new jr. operator. The Fullerton Radio Club has an active station, ULI, located at the Fullerton American Legion Hall. Newcomers to North Orange County are 5UPZ/6, IEP, and EVU. JTV, 75 years young, is active in Orange County. KDN is now in Germany. HDT enjoyed fishing in the High Sierras. GCA vacationed in Hawaii and has returned to college. ODR and his XYL flew to Europe this past summer. SEG and BZE have 75A-4 receivers. KSE wrote a book during the summer. K6DAM, W6KNR, LRU, and YVU attended college at San Diego State the past summer. K6DAM and W6LRU received their Masters Degrees. HZN is back in town after a short trip to Africa. SEG is heard on 20-meter c.w. and 'phone working DX with a new Johnston Kilowatt and three-element beam. CHV added VQ6LQ and XW8AB for two new ones. A "well done" to SK for coordinating the many breakfasts at the Division Convention. CUZ fired up on 7 Mc. with an ARC-5 and worked LU, JA, and VK when band conditions were poor. With summer now over your SCM hopes more operators and clubs will report activities regularly

ALL TRUE  
AND  
STRONGER  
TOO!

or this column. I hope to be more active visiting the clubs in the section this fall, and wish to apologize for the past summer when my paper work got the best of me. Traffic: W6LAB 2175, YDK 1161, K6DBG 36, W6CRT 2.

**SANTA BARBARA**—SCM, William B. Farwell, W6QIW—The Santa Barbara Hamfest held in July was a roaring success, as was Ventura's held in August. K6BVZ is the first RTTY station in Santa Barbara. Sorry to see SBN, the c.w. traffic net, fold up for lack of interest. The Tri County (3820 kc.) and the Peanut Whistle (3860 kc. 'phone) Nets still cover the section for traffic at noon, and ALN (3975 kc.) is a good representation at night. The Ventura Field Day group got its activities "taped" and released over a broadcast station with a swell plug for the hams and their emergency activities. KN6LFQ also was interviewed at KTMS, Santa Barbara, at a later date, giving amateurs another big boost. Tri-County newspapers are opening up with articles and interviews with hams. Public reaction is very favorable. We have good c.d. and AREC groups now with K6KPU, as SEC, ready for any emergency. I am very pleased with the progress made by all clubs in the South Barbara section. There will be a full traffic report next month.

## WEST GULF DIVISION

**NORTHERN TEXAS**—SCM, T. Bruce Craig, W5JQD—SEC: RRM, PAMs: PAK and IWQ. RMs: PCN and QHI. GNE is building the August QST rig. The MOBIL-EARS of Wichita Falls hold drills on 29.1 Mc. each Tue. night and have hidden transmitter hunts each Sun. P.M. Within the last three months K5BIQ, K5BIV, and W5s AGE, DWS, GNE, GVA, KLM, PZS, QJY, QJZ, TLW, and ZAU have installed, principally all-band, mobile rigs. Thanks to MQW for the above news. AHC reports the following heard on the air: IQJ has a new DX-100. ANL is mobile in Colorado. NTC is mobile in New Mexico. AUJ reports the following: SZQ has the B&W 5100 complete with s.s.b. PXI has a new Elmac mobile receiver. TEP is getting an Elmac AF-67 and putting a Fort Worth variable inductor on his mobile. The Blue Ridge Net, on 160 meters, reports 80 per cent attendance for July. AHC went to the track meet at Houston July 24-27. He also participated in the CD C.W. Contest. NVH has his overseas orders. We are glad to get your traffic reports, but please just send a line or two of happenings. KN5BCV broke his collar bone and shoulder blade the day he received his call. DTA is going mobile in August. AWT is finishing a modulator but must build a beam yet. ACK took 3 weeks to build but has an FB Viking Ranger. TTU reports on the activity of the Texas YL Roundup Net each Thurs. on 3880 kc. 0830 to 0930 hours. K5FFB is net control of the Yankee Net, which meets daily on 7290 kc. at 0900 hours. The Dixie Net meets daily at 0800 on 3970 kc. Traffic: K5FFB 620, W5CVA 306, DTA/5 266, KPB 178, AHC 123, BKH 118, PAK 75, BTH 37, ASA 21, CF 20, FJB 16, ACK 11, OCV 8, TFP 7, AWT 5, LTY 4.

**OKLAHOMA**—SCM, Dr. Will G. Crandall, W5RST—Asst. SCM: Ewing Canady, 5G1Q. SEC: KY, RM: GVS, PAMs: PML, SVR, and ROZ. A look at the traffic totals shows clearly the results of hot weather and unfavorable band conditions. Increased openings on the 10-meter band have had a definite effect on the 75-meter band and there have been some indications, such as skip and dead areas, that the 75-meter band will become increasingly poor for daytime operation. The Novice crop has been picking up, as quite a number have been reported around the State, including KN5BXZ and KN5BFX. Also the three ten-year-old licensees in McAlester have gotten their General Class tickets and are heard on the air quite frequently. Several DX-100s are in operation around the State and are putting out good signals. Many hams are reporting from vacation trips and to military and National Guard camps. There was some excellent newspaper publicity from Holdenville on ADC, NVD, PGN, TKI, and WN5BXZ; also publicity on OQT and YL and XYL operators in Oklahoma City, all with pictures. All Asst. Directors got a fine letter from our grand West Gulf Division Director, CF, and he certainly should get the help and cooperation he is requesting. Dad promises a letter at intervals on West Gulf Division doings and in return wants to know of ham needs in the Division. Traffic: (July) W5GWS 132, RST 40, QAC 24, PML 21, TBN 20, ADC 17, PNG 17, EHC 16, GXH 16, MFX 14, BBB 12, MGK 5, CFG 4, UCT 4. (June) W5JXM 50, MFX 19. (May) W5ITF 112.

**SOUTHERN TEXAS**—SCM, Morley Bartholomew, W5QDX—SEC: QEM. AQK is OBS and transmits the latest ARRL bulletins each Mon., Wed., and Fri. at 1800 on 3900 kc. ORG and his XYL and jr. operator visited in Austin the first week of August. Blake is sporting a new Olds Super 88, mobile too. New officers of SARCEN are: THU, ncs; LVE, 1st. alt.; and JHH, 2nd alt. EJT, LVE, and KQG are new members of the Tumble Bug Net. OIK is on 2 meters. YXH has moved to Milwaukee. QEM is rebuilding his 813 rig. WVV has returned from a tour of duty in Germany. The CCARC held Field Day on Padre Island. Those participating were CRO, PPC, INN, LOW.

# QUICK QUIZ

**Q.** Who may operate an amateur radio station?

**Q.** What are the procedures to be followed in obtaining an amateur station and operator license?

**Q.** What are the requirements for portable and mobile operation?

**Q.** How do U.S. amateurs obtain authorization to operate in Canada?

## *The* ANSWERS?

You'll find them all in . . .

Complete FCC and International Rules and Regulations governing amateur radio . . . detailed explanations on amateur licensing covered in separate chapters . . . a complete index for ready reference . . . and, of course, separate study guides for all amateur operator examinations. . . .

*50 cents postpaid*

**THE AMERICAN  
RADIO RELAY LEAGUE**

**West Hartford 7, Connecticut**

GQN, and 6PWG/5. PPC, DQQ, QEM, and 6PWG/5 all have new 15-meter beams. PAIT is back from Illinois. HQR is c.d. radio officer for Corpus Christi. YJB is attending Texas University this fall. Bill runs 2 watts mobile and really gets out; ask MSA if you doubt it. PC has his mobile in a new Mercury. Zone 1, of STEN, held a picnic in Victoria attended by ONG, TVK, RLZ, EV, MSA, BOY, YJB, MXV, and QEM. GI is now EC for El Paso. ZBK mobile and JN directed the highway patrol and ambulances to a major accident outside Houston. XE2CL visited DTJ. BLA is chasing 20-meter DX on c.w. KSY passed the General Class exam and got married before recovering from the shock. JBY also passed the General Class exam. CTZ, DFA, EPZ, WN5HTE, WN5HTJ, and W5UNZ attended camp with the 49th Armored Division, Texas National Guard, and operated K5WCQ, getting messages to home stations in various parts of Texas. Traffic: W5MN 29, TTY 39, DTJ 10, RKI 4.

**NEW MEXICO** — SCM, Einar H. Morterud, W5FPB — RM: JZT. The NMIEPN meets on 3838 kc. Tue, and Thurs. at 1800 MST, Sun. at 0730. The NM Breakfast Club meets on 3838 kc. daily except Sun. at 0700-0830 MST. The NM C.W. Net meets on 3633 kc. daily at 1900 MST. BJQ joined the Navy and is attending NOCS. WNU received an Armed Forces Day Message certificate. MSG averaged 1.1 p.p.m. in the May Frequency Measuring Test. The Pecos Valley ARC held an outdoor meeting in Carlsbad July 10th. RFF suffered extensive shack damage from rains. RVZ is building a 100-watt rig. MYQ, ZMN, VDY, and GXU demonstrated mobile equipment to the c.d. UFO Patrol activities are being coordinated by CA; amateurs interested in UFO (unidentified flying objects) phenomena are invited to participate in on-the-air UFO Patrol discussions on the low end of 20- and 40-meter c.w. Listen for the call "UFP." If this report seems to be mostly Albuquerque activity each month it is because no one sends in any items and it is necessary to use information that we know about locally. This report is on YOUR activities. Traffic: K5FEF 218, FHU 37, W5BZB 20, CEE 17, RVZ 4, WNU 2.

## CANADIAN DIVISION

**MARITIME** — SCM, Douglas C. Johnson, VE1OM — Asst. SCMs: FRIT, A. Webb, 1DB; Aaron D. Solomon, 1OC. SEC: R.R. Bouquets to the LCARC of Saint John and the NBARA for jointly sponsoring the ARRL Canadian Division Convention held at Saint John on July 30th and 31st. It was attended by 152 amateurs and XYLS (YLs). Outside visitors included VE2NJ, VE2OS, VE1KN, W2VDS, W2EWO, and W7RVN. Guests of honor were W1BDI, VE2BE, the mayor of Saint John, the C.D. Director, and the R.I. Activities included a meeting of the NBARA, an ARRL meeting, banquet, speeches, presentation of cups, guessing contests, a c.w. speed contest, initiation into the Royal Order of the Wouff Hong, hidden transmitter hunts, a tour of the city, and a picnic. Over 20 mobile set-ups were in attendance, which is a record. W1BDI gave an excellent demonstration of his 75- and 2-meter mobile equipment. Personally, the Hamfest was one of the best I have ever attended, and all hats are off to the LCARC and NBARA! OC and his XYL made a trip to VE7-Land. XK is doing FB with a new Ranger transmitter. WL is having success with his new mobile set-up. WB has been reelected president of the NBARA. Musician ER did a fine job at the hamfest sing-song. Traffic: VE1FQ 236, UT 83, WK 31, ME 28, OM 4, BN 1.

**ONTARIO** — SCM, G. Eric Farquhar, VE3IA — YJ/3 operated at Queen's Park, London, during that city's Centennial. Personnel located at Civil Defense Headquarters were AJH, QC, BVM, AOO, and YJ. BHK visited old haunts and CAB. AAS now is mobile. AOE now is located in Kirkland Lake. At the Ontario Phone Club picnic, held at Collingwood recently, the following were elected: TX, pres.; RII, vice-pres.; DMI, secy. AML is recuperating from a hospital session. BRI, who did much work in forest-fire fighting service as a pilot, was hospitalized because of a car accident. The newly-appointed QSL Manager for this section, QE, has many cards awaiting self-addressed envelopes. Please assist him by sending yours in today. The Algoma Amateur Radio Club held a ham family picnic on St. Joseph's Island near the Soo. Being a definite success it is likely to become an annual affair. DUY and ANH did a yeoman job with its arrangements. AWR was heard on two meters from Port Dover. AVS completed WAC and reports on the tremendous forest fires and drought. OMs and XYLS of the Hamilton District paid tribute to BIK at a gathering on the shore of Lake Ontario. BIK has moved to Peterboro, a true loss to Hamilton. Good luck, OM. Traffic: VE3NG 140, AJR 76, VZ 51, DQX 50, GI 48, NO 45, DPO 31, KM 27, AUU 22, BUR 19, PH 16, DH 6.

**QUEBEC** — SCM, Gordon A. Lynn, VE2GL — DR continues to hold forth with others on PQN thrice weekly despite the summer fall-off. DR has a new SX-96 receiver which he likes better the more he becomes familiar with

(Continued on page 118)

# HARVEY ALWAYS HAS IT...IN STOCK For IMMEDIATE DELIVERY

## The HALLCRAFTERS Model SX-96 RECEIVER For AM, CW and SSB

A double conversion AM, CW and SSB receiver with selectable sideband and temperature-compensated high frequency oscillator and crystal controlled second conversion oscillators. Covers standard broadcast and 3 shortwave bands: 1720 kc to 34 mc. Precision geared drives used on both main tuning and bandspread dials. Controls include: sensitivity, band selector, volume, tuning, AVC on/off, noise limiter on/off, AM-CW-SSB selector, bandspread, variable selectivity, pitch control, etc. Has 5-meter calibrated in S-units, db, and microvolts. Has phone jack and speaker terminals. Power supply is built-in. Cased in grey-black steel cabinet with brushed chrome knob trim.

Complete with tubes (less speaker).....\$249<sup>95</sup>  
Model R-46A speaker for above in cabinet to match.....19.95

## CENTRAL ELECTRONICS SSB EQUIPMENT

**Multiphase Exciter... Model 20A**  
20 watts peak output on AM, PM, CW and SSB. Single switch for sideband selection. VOX on AM, PM and SSB, plus break-in on CW. Bandswitching: 160 thru 10-meters. Has magic eye indicator for carrier null and peak modulation. Choice of table or rack model.

Wired.....\$249.50 Kit.....\$199<sup>50</sup>

#90672

## MILLEN ANTENNA BRIDGE

An accurate and sensitive bridge for measuring impedances in the range of 5 to 500 ohms at radio frequencies up to 200 mc. Uses no variable resistors. Allows antenna matching unit to be adjusted so as to minimize the standing wave ratio on the radiation system

at all frequencies.....\$45<sup>00</sup>  
#90651 Grid Dip Meter.....61.50

Semi-  
Automatic  
Key

No other key takes the work and worry out of keying like the Vibroplex. It actually does all the arm-tiring work for you — automatically. Lets you send hour on hour, at your own speed free of nervous and muscular tension. Gives years of easy, restful keying. Order yours to-day. Choice of five models, \$15.95 to \$29.95. Left-hand models, \$25.00 more. Carrying case, \$6.75. **FREE** folder. At dealers or direct.

Headquarters for NEW portables, all models and styles of type. Also, **REBUILT** standard and portable typewriters with **ALL CAPITAL** letters and other styles of type. **Quick service.** Get our prices before you buy!

**THE VIBROPLEX CO., INC.**

833 Broadway

New York 3, N. Y.

all it will do. FL reports the Northland Net continues to meet on 3755 kc. at 1915 Wed.; also that a meeting was held at the shack of AMY to celebrate the opening of his newly-built 160-watt transmitter on 10, 20, 40, and 80 meters and to bid adieu to OB, who was leaving that district. BR spent July at his summer place with portable and mobile from that location. BK also was at his summer place getting the odd QSO, which is usually interrupted by children who want to play! LM also is operating from his summer place at Vale Perkins and manages to get in a bit of traffic. OP participated in the recent Frequency Measuring Test with gratifying results. Traffic: (July) VE2LM 48, DR 46, FL 16, (June) VE2DR 54.

**ALBERTA — SCM,** Sydney T. Jones, VE6MJ — PAM: OD, RM: XG. Congratulations to the Southern Alberta Radio Club on the well-planned hamfest. While the attendance was down from the usual it was most enjoyable for all who attended. OD has gone for 8-mm. movies. PS, JP, PV, and YE are new Official Phone Stations. YE and his NYL are back after an extensive trip to British Columbia and Saskatchewan. JP is QRL working over his modulator. YN swept the gremlins out of the rig when MJ visited the shack. EH and his NYL are on a trip to California. YD is working on the organization of the Central Alberta Mutual Aid Net. HM has had VE8YO visiting him. IIX was a recent visitor to Calgary. LQ is making progress on his new rig. LS is ready to go mobile. Monthly reports to your SCM for publication in this column are urgently needed, gang. Please send your news in, otherwise I am unable to find the dope to fill the necessary space. Traffic: VE6HM 143, OD 38, VE7HD 12, VE6MJ 8.

**MANITOBA — SCM,** John Polmark, VE4HL — OO: RB. JW's new signals show what an antenna can do. NW portable is doing well again this year. Thanks to the few who kept the noon and evening nets going throughout the summer months. Now is the time to make application for an appointment. Inquire as to the one you can qualify for and can handle. RA has a brand-new jr. operator, born July 10th. We haven't heard that big signal from DS yet. TQ was a recent visitor to the southern parts. When do we hear that kw. Ed? CX must have left television alone lately as he has heard on 75-meter mobile quite a lot. LOO, our tractor mobile, still is having trouble with the transmitter. Traffic: VE4AI 26, GE 22, QD 6, GB 5, AY 4, CB 4, KG 4, EF 3, VE5DS 3, VE4HC 2, JW 2, RC 2, YR 2, VE5GO 2.

**\$6.95**

**29-PC. DRILL SET  
IN STAND!**

UNBELIEVABLE SAVINGS! 29 tungsten and chrome vanadium steel, twist drills designed for durability, hi-speed! For use in Fairchild and other electric drills and power tools. Standard jobber lengths; FULL RANGE of sizes 1/16" to 1/2"; FULLY GUARANTEED! 'Way off price; metal index stand with marked compartments included. Ship. wt. 3 1/2 lbs.  
Order No. Q-8220 ... Drills and stand, \$6.95

**\$2.69**

**12-PIECE DRAFTING SET**

- 3 1/2" bow divider with pencil
- 3 3/4" bow divider with pen
- 3 3/4" bow divider
- 4 3/4" bow divider
- 4 3/4" bow divider with removable arm
- 3 1/2" extension bar for above
- 4 1/2" ruling pen
- 2" ruling pen (head)
- 2" pencil (head)
- Spare lead in box
- Screwdriver/slider

All parts have fine adjustment screws; all ruling pen heads, divided tips, pencil leads adjustable and removable for cleaning or sharpening or replacement. In addition — like all MICRONTA optical and drafting equipment — the set is guaranteed 6 months against mechanical defect. Fitted 8 1/2 x 4 1/2" black case with two-snap flaps and rayon-velvet lining. If your drafting room or class has one costly silver set, use of these Micronta 12-piece sets will free it for the few instances where it's really needed. Also ideal and economical for students, designers, home craftsmen, model builders. Ship. wt. 1 lb.

## MIDGET ALL-PURPOSE POWER

### RELAYS BY DOW

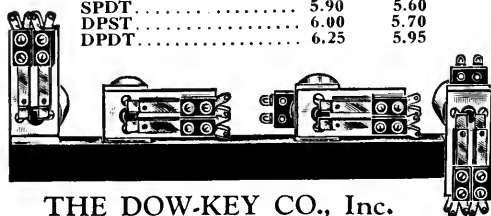

Model DKP

DKP

... a new class of relay  
for Radio and Industry

**S**ILENT as a DC relay, rated at 25 amps non-inductive load at 110 V... mounts easily under a 1½" chassis... carefully engineered for control circuits, motor starting... quiet, rugged... linkage and lost motion eliminated by direct magnet thrust... this versatile relay solves mounting problems: easily changed mounting foot allows combinations for chassis, bank or rack mountings... heavy leaf springs and ¾" coin silver contacts with operate time of 2 to 5 milliseconds put the DOW Midget All-Purpose Power Relay in a class by itself.

Amateur Net		AC	DC
Contacts

## Medium-Power Transmitter

(Continued from page 19)

chart and parts list were calculated to provide a Q of about 12 in the plate tank circuit, for a plate-voltage/plate-current ratio of about 13:1 (2000 volts, 150 ma.). Departure from this ratio will make it necessary to change some of the values of the tank components if a Q of 12 is to be maintained.<sup>6</sup> Ideally, the transmitter should work into a 50-ohm antenna or an antenna coupler that will present 50 ohms to the transmitter, but reasonable variations can be compensated for nicely by juggling the loading capacitors and the value of L<sub>14</sub>. A little time invested in getting the transmitter adjusted to a particular antenna will pay off in signal reports.

TABLE II  
Tune-Up Chart

(Values are approximate)

Band	C <sub>14</sub> (Dial)	C <sub>15</sub> (Dial)	L <sub>14</sub> (μh.)	Output (μf.)
80	95	90	26.0	600
40	23	50	14.5	300
20	82	25	8.2	200
15	15	15	6.0	100
10	5	10	2.3	100

As mentioned earlier, the rig described here has been in use for over a year, on 80, 40, and 20 for the most part, and has been a pleasure to operate. Changing bands is a simple process, and is done very quickly—a great help in the SS contest. Living in a relatively strong TV-signal area, with a TV antenna about every 50 feet in all directions as far as the eye can see, not a single TVI complaint has been received to date. This includes our own TV set, the antenna for which is about 10 feet from the 20-meter ground plane, the mast of which also serves to hold up one end of the 80/40-meter horizontal antenna.

Many complimentary reports have been received on the keying and no clicks can be heard off frequency, even by the nearest locals. Operation is full break-in, and since a TVG unit<sup>7</sup> has been installed in the station receiver, switching from receive to transmit involves only the movement of the hand to and from the bug.

Application of Tekni-Cals to the front panel, plus careful layout has resulted in what we feel is a "finished" look.

The author would like to acknowledge with gratitude the contributions made by W2RDK, W2HSZ, and K2EOC during the design and construction of this rig, and the patience of my XYL, who puts up with this sort of thing.

<sup>6</sup> A 100-μf. tank capacitor is sufficient over the plate-voltage range of 600 to 3000 (assuming a plate current of 150 ma., and a 50-ohm load in each case) for all bands except 80 meters. On 80 meters, 100 μf. is adequate for 2000 volts or more. A 150-μf. capacitor is recommended for plate voltages down to 1000, while a 200-μf. unit should be provided if operation down to 600 volts is contemplated. Also, for 80-meter operation into a 50-ohm line, an output capacitance adjustable up to 900 or 1000 μf. would provide greater assurance of obtaining a proper match.—Ed.

<sup>7</sup> Miller and Meichner, "TVG—An Aid to Break-In," QST, March, 1953.

## EASY TO BUILD!

### Self Supporting STEEL TOWERS For Rotary Beams, FM, TV

You can erect this tower yourself. Just dig four holes, set anchor posts in place, bolt the pieces together. 5½ ft. ladder sections make it easy to work higher as tower goes up. It's a lot of fun to build your own tower—and saves you money, too!

### ATTRACTIVE—NO GUY WIRES!

- 4-Post Construction for Greater Strength!
- Galvanized Steel—Will Last a Lifetime
- SAFE—Ladder to Top Platform
- COMPLETE—Ready to Assemble
- Withstands Heaviest Winds

Width of  
Base Equal  
to 1/5 Height

Vesto Towers are available in a wide range of sizes to meet requirements of amateurs and commercial users alike. Note the low prices for these quality lifetime towers: 22'—\$104, 28'—\$127, 33'—\$149, 39'—\$182, 45'—\$208, 50'—\$239, 61'—\$299, 100'—\$895.

Towers are shipped to your home knocked down, FOB Kansas City, Mo. 4th class freight. Prices subject to change... so order now! Send check or money order... or write for free information.

job on any band from 21 to 225 megacycles. It's not the ultimate in receiving equipment, of course, but you may be surprised at how well it compares with even medium-priced receivers, particularly on 28 or 21 Mc.

Readers are sure to ask, "Why didn't you put in an r.f. stage?" (or an i.f. amplifier, or make provision for plug-in coils, or build a voltage-regulated power supply, or install a panel, or — or — or). To this we reply that for once we tried to make a usable converter that would be devoid of any feature not absolutely necessary to provide reception on the bands to be covered. This is "the simplest"; if you want de luxe features you can take it from here.

## Wait and See

(Continued from page 31)

getting. "Yeah," he says, with a sour look, "I've been listening to you lately but if I have to have a note like a bunch of sparrows just to get to talk with some guy a little farther away than I can get normally I'll be dogged if I don't jest lock up the shack and take up photography." If I had been set up with store teeth then I sure would have dropped my uppers. The guy meant it! I know he did because a year later he was off the air and so help me he has never returned.

It makes me sad to think about Old Bill. He had one of the best fists on the air and more fun with his hamming than any three hams are entitled to have. But he had an opinion and he defended it even to the point of dropping his hobby. I have always thought he just couldn't endure the thought of learning a new set of techniques in order to hold his own with the rest of the gang. After all, spark operation was simple and the new c.w. method was much more complicated by comparison. Oh well, I've seen many Old Bills in other fields and I guess there's nothing I can do about them even if they do make me sad.

Along about last year Old Joe went single sideband. Now the whole gang of locals are saying mean things about him and his "rubber-voiced" 'phone communications. They say he is taking up too much of the band and I'm kinda inclined to agree with them when I'm listening to a.m. on my receiver. But you know, I notice he doesn't have the least bit of trouble with QRM

when the rest of the band is so cluttered with a.m. signals there isn't a place to light.

**LMB** 1011 Venice Blvd., Los Angeles 15, Calif.

Progress is necessary and it must come. The s.s.b. boys tell some fantastic stories about the wonders of their 'phone method. Their stories are almost too good to be true and I can't help but be suspicious of them. If what they say is even partially true, s.s.b. does represent progress. It looks to me as though all this fuss about s.s.b. is because the new method is gumming up the old. When c.w. came along, it was the old method which interfered with the new. But the new method was the better method. It represented progress and it did win out, but it took several years to win the boys over.

It seems to me as though both sides in this s.s.b.-a.m. row have a few new tricks to learn. It seems the s.s.b. boys need to be very sure their rigs are clean and the a.m. boys have a few more things to learn about their receivers. It'll take time for the row to be decided, but all concerned should wait and see. Many on-the-air friendships will be broken up by the a.m. vs. s.s.b. row. Many of the voices which are now so familiar as I tune across the band will no longer be heard. It makes me sad to see this history repeating itself. Seems it is just my bounden duty to ask both sides to be patient if the urge to spout off about opinions comes along. Seems I've just got to ask all the boys to say as little as possible to hurt the other fellow until time gives us the answer. Wait until time does give that answer, please!

You know, since QRM is so heavy, it would be foolish to get into this subject on the air. I believe I'll just give Old Joe a call on the land line so I can go and sit with him and really look into this s.s.b. business first hand. It might need a lot of looking into.

## Mobile Antenna Tuning

(Continued from page 33)

as far back against the front seat as possible. This location keeps the control within easy reach, although nothing of the cable is in sight. The hole in the car-body floor is also hidden and is easily covered when the installation is removed. No fastener or adapter could be found for the cable at the tuner end, so it was merely clamped to the car body about a foot from the tuner.

In connecting the line that runs between the thermocouple on the unit and the r.f. ammeter on the dash board, be sure to observe the polarity markings on both the thermocouple and the meter.

## Adjustment

Operation of this unit is so simple and straightforward that little explanation is necessary. However, a few pointers may be helpful in getting best results on the first trial. Mount the unit as close as possible to the receptacle at the base of the antenna. Prune the loading coil so that about five turns of the rotocoil are in the circuit at the high-frequency end of the band. This will mean about seven turns less on the Hi-Q type Master-Mount coil, or slightly more on coils of

smaller diameter. Here is where a grid-dip meter comes in handy, although the job is by no means impossible using just the transmitter tuning indicator and the antenna-current indicator. Now try tuning the antenna to the low end of the band by means of the tuner. You will be surprised at how few more turns of coil are necessary. It is advisable to mark each end of the band on the dial of the tuner with paint or white ink. After these adjustments are made, operation consists only of tuning the transmitter and then tuning the antenna for maximum indication of the r.f. ammeter. It may be found that with very low-power transmitters (10 watts or less) there is only a slight indication of current at exact resonance. Meter deflection can be increased by adjusting the leads to the meter transformer so that slightly more than one turn surrounds the core.

As might be expected, the entire system works equally well for receiving. The antenna change-over relay should be placed in or near the transmitter.

**"Little Oskey"**

(Continued from page 35)

the unit becomes inoperative.

With  $S_2$  closed, everything is ready. When the key is up the receiver is heard; when the key is down a sidetone is heard and the transmitter is keyed. The oscillator tone level can be adjusted with the gain control on the unit, while the receiver level is controlled at the receiver. If the station being worked wishes to break in, his signals can be heard between the characters being transmitted.

Since the receiver is actually on during key-down conditions (even though it appears to be off in the headphones), care should be taken not to damage the receiver by r.f. overloading. The monitor has been used successfully at WICUT with a cathode-keyed transmitter running as high as 200 watts input. For simplicity, separate transmitting and receiving antennas are used. The unit cannot be used with grid-block keyed transmitters — it is designed for cathode-keyed rigs only.

If the transmitter and receiver are turned off the monitor can be keyed and used as a code-practice oscillator. The sidetone will appear in the headphones as the unit is keyed.

**Strays**

K2KTX tells us that during an operation, K2IWT was reported to have been tapping out code while unconscious from the effects of the anesthesia. Evidently K2IWT is one fellow who does not have to worry about learning the code subconsciously.

— . . . —

## What Is This Thing Called the "Hump" in CODE?

**T**HE *hump* (around 8 words) is the thing that tells you you have wasted your time by starting out wrong. Thirty years ago when we started teaching Code our students too ran head-on into the *hump*. We went to work to find out why. TWO-PHASE, STEP BY STEP instruction is the perfect answer. In this method dotdash is not A. The SOUND resulting from dotdash is A. There is also the important factor of correct timing. If the signals are not timed correctly the resulting sound will not be correct. There are many, many things connected with proper Code instruction, many of them so small they seem inconsequential. Others are so technical that many so-called experts fail to understand them. It's a long story but I have it all written up and will be glad to send it to you. A postcard will bring you the full story.

## AT-1 Modifications

(Continued from page 39)

while holding the key down. If the amplifier is neutralized, the grid current will drop to zero and the lamp bulb will go out. Hold the key down only for a second or two when making these tests, because the amplifier tube draws excessive current when it has no grid excitation.

If grid current is present with the crystal removed it indicates that the amplifier is oscillating and must be neutralized. Hold the key down and adjust  $C_N$ , the neutralizing capacitor, to a setting that shows no grid current on the meter. Use a small insulated screw driver to adjust the neutralizing capacitor.

When the amplifier is neutralized on 80 meters, reinsert a 40-meter crystal and tune the rig up on 15. Make the same tests and follow the procedure as on 80. If the amplifier is not already neutralized on 15, the setting of  $C_N$  should not have to be changed very much to stabilize the amplifier. When the amplifier is neutralized on 15, it should be stable on all bands. It is not necessary to neutralize on 10 meters because the amplifier works as a frequency doubler.

## Additional Information

In its modified condition, the transmitter can be used with 80-meter crystals for 80, 40, and 20. A 40-meter crystal will take care of 40, 20, 15, and 10. In the 15-10-meter position, the oscillator tuning is near minimum capacitance for 15 and near maximum for 10 (20-meter drive to the amplifier on this band).

A very noticeable keying chirp was present both before and after modification, most of it being caused by the change in oscillator screen voltage between the key-up and key-down conditions. The change was minimized by connecting a 68,000-ohm 1-watt resistor from Pin 6 of the oscillator tube socket to chassis ground.

To convince yourself that the modifications described here are worth while, try this test: Before making any changes, connect a 40-watt lamp bulb to the output terminal and tune the rig up on each band, observing the brilliance of the lamp. After the modification, go through the same procedure. You won't need dark glasses, but you should be pleasantly surprised by the difference in output. And don't forget — transmitters may be rated by input, but it's the output that works 'em!

## COMING A.R.R.L. CONVENTIONS

October 15th-16th — Central Division, South Bend, Ind.

October 22nd-23rd — Midwest Division, Omaha, Neb.

(Details on page 10)

# Use Your Military Training

**The time was never more opportune than now for becoming associated with the field of advanced electronics. Because of military emphasis this is the most rapidly growing and promising sphere of endeavor for the young electrical engineer or physicist.**

*E.E. or PHYSICS GRADUATES  
with experience in  
RADAR or ELECTRONICS  
or those desiring to enter these areas . . .*

Since 1948 Hughes Research and Development Laboratories have been engaged in an expanding program for design, development and manufacture of highly complex radar fire control systems for fighter and interceptor aircraft. This requires Hughes technical advisors in the field to serve companies and military agencies employing the equipment.

As one of these field engineers *you will become familiar with the entire systems involved*, including the most advanced electronic computers. With this advantage you will be ideally situated to broaden your experience and learning more quickly for future application to advanced electronics activity in either the military or the commercial field.

Positions are available in the continental United States for married and single men under 35 years of age. Overseas assignments are open to single men only.

Hughes-equipped  
Convair F-102  
all-weather  
interceptor.

## New gear you're looking for?

... you're sure to find it at Burghardt's!

**Terrific Trade-Ins**—As liberal as anyone in the country ... and yours may be worth more at Burghardt's. Trade-ins usually cover down payment on your new gear.

### 10% Down—Easy Terms

—10% down lets you "take it away." Up to 18 months to pay on balances over \$200. Burghardt's financing saves you money—adjusts terms to your budget. All time payments based on local bank rates. Full payment within 90 days cancels interest.

### Speedy Delivery—Personal Attention

—No order too large or small for personal attention. All inquiries acknowledged and orders processed day received.

### N—E—W

**NATIONAL NC-300**—Brand new from top to bottom, here is National's new "dream receiver", the NC-300. Dual conversion with better than 50 db primary rejection on all amateur bands—more than 60 db secondary image rejection. 10 dial scales for 160 to 1 1/4 meter coverage—extra long slide rule dial easily readable to 2 kc without interpolation up to 21.5 mc. Super selectivity—optimum bandwidth for CW, phone, phone net, or VHF operation. Separate linear detector for single sideband. Giant, easy-to-read "S" meter.

Massive in appearance. Finished in attractive two-tone grey enamel. May be used as a rack or table model unit. Complete with all tubes.....

**\$19.07** per month for 18 months.

ONLY  
**\$34.95**  
DOWN

**NATIONAL 183-D**—Outstanding in design—top performance even under most severe receiving conditions. Calibrated electrical bandspread for 80-75, 40, 20, 15, 11-10 and 6 meters. 3 IF stages; 16 tuned circuits. Better than 1.5 microvolt sensitivity for 6 db signal-to-noise ratio throughout the entire range.

With tubes, less speaker.....  
**\$21.77** per month for 18 months.  
Matching 10" speaker. Housed in metal cabinet.....

ONLY  
**\$39.95**  
DOWN

**NATIONAL HRO-60**—One of finest, most up-to-the-minute receivers available. Dual conversion above 7 mc; 2 RF stages. Sensitivity is 1. microvolt or better at 6 db signal-to-noise ratio. 1.7 to 30 mcs. Bandspread on 80, 40, 20, 11-10 meters. Excellent selectivity and high sensitivity. Complete with all coils and tubes.....

**\$29.15** per month for 18 months.

ONLY  
**\$53.35**  
DOWN

**NATIONAL NC-98**—Complete with crystal filter and an "S" meter! Two models available—electrical bandspread calibrated for SWL or amateur bands. Edge-lighted dial scales—noise limiter—separate high frequency oscillator. A quality unit at a real budget price. Covers 550 kc to 40 mc.....

**\$8.12** per month for 18 months—Matching speaker.....

ONLY  
**\$14.95**  
DOWN

### OTHER TOP QUALITY NATIONAL UNITS IN STOCK

Hallierafter Jobber Today

**hallicrafters** CHICAGO 24,  
ILLINOIS

**WANTED**

**MEN TRAINED IN ELECTRONICS, inter-  
ested in career with established company  
furnishing offshore electronic surveying  
service in Gulf Coast area. First or Second  
Class radiotelephone license required.**

For further information write

**LORAC SERVICE CORPORATION**  
P. O. Box 6842, Houston, Texas

kilocycle per minute in cold solution can be accelerated to two kc. per minute by heating. Remove crystals from solution and rinse in clear water to stop etching process. Few crystals lose activity in the amount of etching required.

**W8UZ, Columbus, Ohio**—Opening of 50-Mc. band to Technicians brought about 25 new stations to the band in Columbus area, with more coming.

**W9EET, Chicago, Ill.**—Ten days of operating on 50 Mc. in Lincoln, Nebr., beginning July 4th, netted 116 contacts in 26 states.

### Another Communicator Hint

In June QST we described a method for using the Gonset Communicator as a converter with a communications receiver as the i.f. This involved retuning of the i.f. system slightly, so it might scare off a potential user. (The i.f. is broad and the adjustment is in no way critical.) W1EOI goes us one better by wrapping an insulated wire around the leads to the noise-clipper switch, poking this through the back screen on the Communicator so that it protrudes about one inch. A piece of coax is connected between this wire and the communications receiver, in the usual manner. Enough i.f. energy on 6 Mc. is thus made available to give a reading, on noise alone, of S6 on W1EOI's NC-183 S-meter. No readjustment of the i.f.s is needed, and the wire may be pulled out, leaving the unit in exactly its original condition.

## TRANSISTOR TRANSFORMERS

AT LAST A COMPLETE LINE OF QUALITY TRANSFORMERS FOR EVERY TRANSISTOR APPLICATION AT A PRACTICAL PRICE!

**2.75 each**  
Lots of 10 Assorted  
**2.95** Singly, each

Nickel-Steel and Silicon Steel Laminations • Wound on Nylon Bobbins • Mylar Outer Wrap Color Coded Leads Have you been experimenting with transistor circuits? And have you been forced to make-do with compromise transformers or improvised units? And have you had to pay from \$6.00 to \$12.00 for them? The Argonne line brings you a wide variety for experimentation as well as for replacement. Efficiently designed to meet the needs of miniaturization and engineered to provide more power handling capacity and improved frequency response with minimum distortion. All nickel-steel laminations except asterisk which are silicon steel. Average net weight 1 1/2 oz., average shipping wt. 4 ozs.

Specially engineered crystal Microphone Attaches to lapel. Only 1 1/8" in diameter. Exceptional frequency response. Output level —55 db. chrome plated case and clip for attaching to lapel. Includes 5 ft. of shielded cable. Shpg. wt. 1 lb.  
PA-18 ..... 2.95

**MAKE YOUR OWN  
PRINTED CIRCUIT  
NOTHING ELSE TO BUY!**

Our Inexpensive Etched-Wire Kits Contain: Laminated Copper Boards (XX-P); Printed Circuit Tube Sockets; Copper Etching Material and Instructions; Etch-resistant material for Circuit layouts; Eyelets and drill for connections; Sealed layout sheets for making your own or standard Printed Circuits. All Kits Are

Supplied with Plastic Case  
**5001P—BASIC KIT** ..... **3.95**  
Contains a complete assortment of materials needed to make a variety of different Printed Circuits. Circuit Diagrams include Multimeter and 1-tube Receiver.  
**5003P—SERVICEMAN & TECHNICIANS' KIT** ..... **9.75**  
Contains three times the material of Kit 5001P with special sockets, connectors and double-faced Copper Boards.  
**5004P—PRODUCT DESIGNERS' KIT** ..... **25.00**  
This special Kit enables the Manufacturer and Laboratory to make a pilot run of etched wire Printed Circuits with his own staff and facilities. Contains all the latest information, materials and methods for adapting your product to mass production techniques.

**REMOTE CONTROL FOR  
SILENT TV VIEWING**

The hard-of-hearing can listen to radio or TV without turning the volume so high that others can't stand the noise. They can listen with loud speaker cut off, or if others want to listen, with normal speaker volume. Excellent for noisy programs. Let the Kids listen and view with speaker cut off. Comes complete with miniature phone, fits snugly in ear, 20 feet of cable and instructions.  
MS-125 ..... 6.50  
TWO CAN LISTEN WITH ADDITIONAL EAR PHONE ..... 1.95

• For Hard-of-Hearing  
• For Late Listening

**6.50**

**TRANSISTOR 455KC I.F. 1/2"x1/2"x3/4" H**

This tiny I.F. is the same as used in the transistorized sets of the leading manufacturers. Ideal for building miniature equipment.

## EASY TO LEARN CODE

It is easy and pleasant to learn or increase speed the modern way — with an **Instructograph Code Teacher**. Excellent for the beginner or advanced student. A quick, practical and dependable method. Available tapes from beginner's alphabet to typical messages on all subjects. Speed range 3 to 40 WPM. Always ready, no QRM, beats having someone send to you.

**ENDORSED BY THOUSANDS!**

The **Instructograph Code Teacher** literally takes the place of an operator-instructor and enables anyone to learn and master code without further assistance. Thousands of successful operators have "acquired the code" with the **Instructograph System**. Write to lay for full particulars and convenient rental plans.

## INSTRUCTOGRAPH COMPANY

4709 SHERIDAN ROAD, CHICAGO 40, ILLINOIS

**New "TENACLIP"** Reg. U. S. Pat. Off.

**attaches to car... stops antenna whipping**

Clear plastic clip quickly fastens to rain molding... holds right or left antennas. Prevents damage to antenna from low hanging limbs or driving into garage. See your dealer or order direct. No C.O.D.'s please.

# HARRISON'S

## POWER PEAKING PACKAGE

Shows you when your beam or mobile antenna is really at absolutely top efficiency!!

### MILLEN GRID DIP OSCILLATOR

The original, and still the best! No lab or shack should be without one. Invaluable for xmitter, receiver, antenna, etc. adjustment, de-TVI'ing, etc. Accurate calibration. Sturdy "one-hand" case. Works on 115 V AC. Complete with coils for 1.7 to 300 Mc, and instructions. Millen 90651. **\$61.50**

### MILLEN ANTENNA BRIDGE

Just out! New, accurate bridge for direct reading of impedance of antennas, transmission cables, coils, receiver input, etc. of 5 to 500 ohms, at up to 200 Mc! Indicates reactance.

So sensitive a GDO provides full power for all measurements. Read about this versatile "must" instrument in August QST.

Millen 90672, with coupling loops. **\$45.00**  
(Millen 28801 shielded condenser for bridge-builders—**\$9.00**)

No more blind cut-and-try! Read resonant frequency and radiation resistance. See when you have tuned out reactance, and have perfect impedance matches. Check your standing wave ratios. Tells you all you have to know to get the most power out into your signals!

The Harrison Power Peaking Package consists of the new Millen Antenna Bridge, a Millen GDO, coaxial adapter fittings, and simple step-by-step instructions.

**Only Harrison has it! For sale at \$109.75, complete, or you can**

## RENT IT!

by the week at moderate rate.

Stop wasting your valuable RF power! Order now, or ask for rental application. (CLUBS! Split the cost, with a "TUNE-UP PARTY".)

Don't let a storm leave you **WITHOUT AC**

for your rig, furnace, freezer, water pump, etc!

World-famous KATO brand new, low cost, dependable emergency duty gasoline driven generator plants. Hand start, need no batteries. Fully filtered. Deliver 115 volt, 60 cycle AC, automatically regulated. Powerful, air-cooled engines.

1000 Watts—**\$165.00**

That's what Harrison PCA customers say, when ordering by phone, by mail, or in our stores. It's the modern, convenient way to shop! And, the monthly statements can be paid either in full or by modest budget payments, with no red-tape or fuss!

Ask for your Confidential Acquaintance Form, today.

Power your rig from the sun!  
**SOLAR CELLS**

IR's type B2M.  
(See pg. 11, Sept. QST)  
**\$1.50 each, 6 for \$8.75**

**HARRISON HAS TRANSISTORS!**

### GLAS-LINE

The new Corning Fiberglass and plastic insulating guy line. Strong and durable!  
**\$2.89 per 100 feet.**

**BC-458 \$3.95**

5.3 to 7 Mc COMMAND TRANSMITTERS In really good used condition, complete with all tubes and crystal.

### CENTRAL ELECTRONICS

BC-458 Conversion Parts Kit. Makes it into a swell VFO for SSB exciters. 15 thru 160 meter bands.

With dial and instructions. **\$15.00**  
Cabinet like Signal Slicer, with De-Luxe panel **\$10.00**

Crystal Controlled converter to extend VFO into 10 meter band. Complete Kit. **\$27.50**

Factory wired. **\$37.50**

**HARRISON IS HQ FOR ALL SSB GEAR**

**GOT A 12 VOLT CAR?**

Here's the dynamotor that will put a real "sock" into your signals!

Rated output 625 volts DC at 225 ma. (In typical installation, input voltage drop can reduce output voltage by as much as 10%.) Latest compact, high efficiency easy-on-the-bbs.

Brand new, recent production, military spares. Worth several times the low, low Harrison price of only **\$17.95**

### BEAM ROTATOR

Brand new TV rotator, complete with control case containing reversing switch, transformer, and meter type direction indicator, AT AN AMAZING PRICE!

Manufacturer says that with a radial thrust bearing (\$2.97 extra) it will handle up to a 20 meter, two element Mini-Beam, and he guarantees it for a full year! **\$15.99**

For 1 1/4" mastling.

(Control cable—\$3.48 per 100 feet) BEAMS? Telrex, Short-Beam, Mosley VP, Gonset, Johnson, Hy-Lite, etc., etc. Harrison has 'em all!

## Strays

The Civil Aeronautics Administration an-  
nounces openings for electronic engineers in their  
New York and Washington headquarters. Those  
employees working out of New York will be in-  
volved in the engineering, installation, and mod-  
ification of CAA communications stations, omni-  
directional ranges, instrument landing systems,  
airport surveillance radar, precision approach  
radar systems, and ultrahigh frequency distance-  
measuring equipment. For those in Washington,  
the work will be similar, with the possible in-  
clusion of design and specification writing, and  
factory inspection of equipment.

The New York openings involve considerable  
travel, while those in Washington require only  
moderate travel. Per diem of \$12.00 a day will be  
paid in addition to the regular salary to those em-  
ployees assigned outside the headquarters city.

Salaries are from \$4345 to \$6390. For specific  
information regarding qualifications, contact per-  
sonnel officer, Civil Aeronautics Administration,  
Federal Building, N. Y., International Airport,  
Jamaica, N. Y., or Civil Aeronautics Administra-  
tion, Washington 25, D. C.

## How's DX?

(Continued from page 59)

plenty good for the last three months, ten good off and on, 20 and 40 always good, and sometimes 75 is good but lots of static on the lower frequencies. I had a couple of schedules on 160 but didn't break through." George is taking back a gallon's worth of new gear, so next time he tries Top Band, watch out! OA5G had eight operators all told, has a 90/40 DX record, and is located atop a bluff overlooking San Juan Bay and the broad Pacific. Antenna space is unlimited and so is good copper wire courtesy Marconi Mining Co. facilities. . . . W1ZDP finds that FM7WTF seeks Idaho, Me., Neb., N. Dak., Nev. and Wyoming for WAS. . . . CX7CO continues to put through a fine 7-Mc. signal with his homebrew c.c. 6V6-807 rig, receiving with a 12-tube double-con super. Prior to CX7CO activation in March of '55, Dan operated a bit at CX31K. One of his most regular QSOers continues to be W2BVS who also likes to "roll his own." . . . W6YY, keeping a sharp ear peeled for Easter Island, reports that CE0AD regularly appears at 0400 GMT of a Friday on 14,098-kc. c.w. and 'phone. . . . On October 15th-17th RCP (Peru) invites the 21 republics of the Americas, plus KL7 and KZ5, to participate in a contest commemorating the 25th anniversary of Radio Club Peruano. Stations in these countries will work each other (no contacts between stations in the same country) once per band during the period 1700 GMT October 15th to 0500 October 17th, exchanging five-digit ('phone) and/or six-digit (c.w.) serials consisting of RS or RST plus a three-digit figure selected at random for the initial contact. (Hereafter one sends the three-digit figure received from the previous station worked.) Multiply total contacts by the total number of band-countries worked, adding to the band-country total the number of different bands used for contacts. (E.g., 30 QSOs times 14 band-countries plus 3 bands equals a final score of 510 points.) As discerned from logs submitted to RCP, Control de Concursos, Casilla No. 538, Lima, Peru, which entries must be in the hands of RCP within 30 days after completion of the test, diplomas and/or medallions will be available to high scorers in each of the Americas, U. S. and Canadian call areas. Separate 'phone and c.w. entries are specified. Note: Entrants are obliged to contact at least 10 Peruvian stations on 'phone, or 3 on c.w., to be eligible for awards.

Hereabouts — W1ZZK has one of those rare HO1EH (HP1EH) QSLs mentioned in a previous column. . . . With 150 countries worked at 150 watts input, K2BZT wonders if any of the kw. boys can match his country-per-watt-average. . . . W6AM made a hit in flashing his Alaskan vacation before the SCDXC boys in the form of 350 color slides. Don divided his time up north between KL7 flora, fauna and bam radio. . . . Ex-TA3AA, now W6OME, entertained W6EAY and a recent San Diego DX Club gathering. Andy could make a kingsized shortsnorter from his XYL's collection of beauteous Turkish rugger. . . . W4VNE's recent DXCC award was his fourth. Mac previously turned the trick thrice as W8LZK, NY4CM and KP4HU. . . . W7CWN, who works his share of 50-watt DX on 20, admits that his BC-348 is aging a bit. Come to think of it, those receivers are at least ten years old now and many of 'em have DXCCs under their belts — still going strong. . . . K2MJG, ex-W8KFY, was aghast to see our 160-meter boldface heading disappear during a summer month or two. Needless to say, if and when 1.8-Mc. DX news transpires you'll find it in "How's". . . . The ARRL DX Century Club Countries List now has been adopted by the Newark News Radio Club, a DX-savoring organization of long standing, as its official DX-performance yardstick.

W2QHH, Howard Bradley. (Score two for the OMs — it's time for the distaff side to enter the race!)

— ... —

Mrs. George Allinger, XYL of W9MYI, and Mrs. Dewey Darling, XYL of W9WBA, are co-chairmen of women's activities for the ARRL Central Division Convention, South Bend, Ind., Oct. 15th and 16th. The ladies program includes: Sat. morning — coffee get-together; afternoon — entertainment, cards, prizes, and shopping; Sunday — tour of Notre Dame University. There will be a special meeting of all licensed YLs from 1:30 to 3:30 p.m. Saturday. Write Box 351, South Bend, for further information.

### Keeping Up with the Girls

Members who attended the YLRL Wed. morning 'phone net meeting conducted by W4HLF at Skyline Drive, Va.,

(Continued on page 146)

Making it easier to log a Maine YL contact, W1UZR, Rita Slater, of Waterville, is on 75 and 80 daily. With some brawn supplied by local ham friends, Rita puts up her own antennas and enjoys working out technical problems on her own. An OPS and member of six N.E. traffic nets, Rita spends her working hours on 'phone too — at the local telephone office.

## PROFESSIONAL ROTARY INDUCTORS

...adjust that L/C ratio for top performance at any frequency!

Now, for peak efficiency from pi-networks and other tank circuits choose one of these popular Johnson variable inductors for your equipment. Two new models now available, both variable pitch wound with heavy No. 12 wire—for AM transmitters operating up to 500 watts or for SSB transmitters up to a full kilowatt. Windings mounted on grooved steatite form—contact wheel is spring loaded to provide smooth, reliable inductance variation throughout the entire range. Time-tested by amateurs the country over, these dependable Johnson inductors are your best buy.

Available at Electronic Parts Distributors everywhere.

# Portable TRANSMITTER/RECEIVER

## For CD, Emergency Units, Clubs and Hams

Measuring only 4" x 6" x 12" and weighing less than 10 lbs., the ECCO HT-2 is specifically designed to meet the demand for an efficient, economical portable transmitter/receiver for 10-meter operation.

Controls are reduced to a minimum; it's inexpensive to operate. Base loaded whip provides maximum flexibility and portability with minimum loss in radiation. Construction and materials of highest quality.

RECEIVER uses 1T4 R.F. amplifier and 3A5 regenerative detector and audio output. TRANSMITTER uses 3A5 oscillator and speech amplifier, 3A4 final amplifier and 3A4 modulator. Carbon microphone input; high level plate modulation. Entire unit operates on one 1½ volt and two 45-volt batteries.

6-meter model available shortly.

**BURSTEIN-APPLEBEE CO., 1012 McGEE ST., KANSAS CITY, MO.**

SCM K2BG sent this photo of K2INQ, Peggy Bergin, of Moorestown, N. J. Using her Dad's rig (W2UA) on the lower frequencies, Peggy operates two-meter mobile with her own call. She takes an active part in the local RACES program, when not on duty as a registered nurse.

presented their NCS with an embroidered picture done by W4SGD, Katherine, and a cake baked by K4BNG, Janie, in appreciation of Arlie's service. Members present were K2IWO, W2OWL, W3s CZT MSU OQF PVH UTR YTM, WN3CEA, K4BNG, W4s AHN BLR BQI DWP HLF SGD. . . . SPARCYLs of St. Petersburg have welcomed four more YLs to membership — KN4EBQ, W4s GXZ HRC, KN4CUY. . . . Eight-year-old KN6MTQ, Elizabeth, and ten-year-old KN6GXQ, Patty, are new members of the San Francisco YLRL club. . . . Minnesota has 40 YLs, according to a count by YLRL chairman for the tenth district, W0KJZ, Lydia. . . . W6PCN, Peggy, and OM W6GCV, are building their house on the highest inhabited ridge on the highest of San Francisco's hills. When they figure out how to set a 70-foot antenna pole into solid rock, the Detschs think they'll have a choice spot for their 20-meter DXing. . . . KZ5VR, Virginia, is a new Canal Zone YL. . . . YLRL Publicity Chairman WITRE announces that the YLRL Photograph Album and Scrapbook are available upon request. Barbara will send the books express collect, and they must be returned postage prepaid.

W1BB, well-known OM of Winthrop, Mass., claims he hasn't had to go without his supper yet, although his wife Alice has done a lot of operating on 80 and 2 since becoming WN1DQF. The Perrys think the answer is to set the XYL's rig right in the kitchen — cooking and QSOing blend well together. With the pet parakeet chirping "hi," Alice has a harmonious atmosphere for preparing the ingredients for her General Class ticket.

(d) The radio station carrier shall be discontinued during periods of no message transmission.

12.194 *Special Operation*. In certain cases, the Federal Communications Commission may authorize specific stations to operate during a CONELRAD RADIO ALERT in a manner not governed by these Rules, provided, such operation is determined to be necessary in the interest of National Defense or the public welfare.

12.195 *Resumption of Normal Operation*. At the conclusion of a CONELRAD RADIO ALERT, each standard, FM and TV broadcast station will broadcast a CONELRAD RADIO ALL CLEAR MESSAGE. Unless otherwise restricted by order of the Federal Communications Commission, normal operation of stations in the Amateur Radio Service may be resumed upon reception of the CONELRAD RADIO ALL CLEAR. Only the CONELRAD RADIO ALL CLEAR will authorize termination of the CONELRAD RADIO ALERT.

12.196 *CONELRAD TESTS*. So far as practicable, tests and practice operation will be conducted at appropriate intervals.

## CODE PRACTICE FROM VOICE STATIONS

Over the years various amateur stations have conducted programs of instruction in the International Morse Code to help newcomers acquire sufficient skill for their tickets (e.g., see p. 69, May *QST*). In some instances this activity is conducted on the voice bands, with an audio oscillator in front of the mike so that code characters and voice instruction might be interspersed. A special action of FCC some twenty years ago made an exception for this emission in code practice on A-3 bands, but because of its age and obscurity there has been difficulty in recalling its text and application. As the result of conversations between ARRL and FCC it has now, logically, been decided to write the exception into our regulations, and the Commission has proposed to add a Section 12.114 (b) to our rules to provide that "Whenever code practice, in accordance with Section 12.106 (d), is conducted in bands authorized for A-3 emission, radiotelephony tone modulation may be utilized when interspersed with appropriate voice instructions." Any comment on the proposal must be filed by November 15th.

## AT PRESS TIME — 420-MC. RULING

FCC has just issued an order providing that effective October 1st the present 420-Mc. limit of 50 watts peak power will be changed to 50 watts plate input.

## Strays

Amateurs everywhere will be saddened to note that the name of Edward Clark Crossett, W6DZH, ex-W1CCZ, appears in Silent Keys this month. During the late Twenties, many experiments with beam antennas were conducted by prominent amateurs at the site of W1CCZ, Mr. Crossett's station at Wianno, Mass.

If you operate a kilowatt, or ever plan to—buy your Kilowatt "Matchbox" today. Use it with any lower power unit and switch to maximum power later.

## NEW KILOWATT "MATCHBOX"

### SWR BRIDGE

Required for adjustment of antenna coupler—permits most effective use of a low pass filter. Impedance of 52 ohms, may be changed to 72 with a change of resistor. Equipped with SO-239 connectors and polarized meter jacks for 0-1 ma meter.

Cat. No. 250-24

Amateur Net **\$975**

• Bandswitching • Self-contained • Performs all transmission line matching and switching functions required in the high power station

Now, quickly, easily . . . load and match balanced and unbalanced lines over a wide range of antenna impedances at the kilowatt level. Single knob bandswitching, front panel tuning and matching—no coil changing or tapping necessary. Matches unbalanced impedances from 50 to 1200 ohms—balanced impedances from 50 to 2000 ohms—tunes out large amounts of reactance as well.

Equipped with a heavy duty antenna changeover relay, the Kilowatt "Matchbox" permits separate matching of the antenna to the receiver and also has provision for muting the receiver when transmitting. An electronic time delay circuit prevents arcing of the relay contacts and provides protection for the transmitter components from undue stress of momentary high voltage surges during changeover. Nominal input impedance is 52 ohms—may be used with any transmitter operating up to and including 1000 watts.

Amateur Net

Supplied as a completely assembled and pre-tested unit in an attractive, fully shielded, marmoon and grey cabinet. Cat. No. 250-30

**\$12450**

Sold only through authorized Johnson Distributors—most offer convenient time payment plans.

## E. F. JOHNSON COMPANY

2832 SECOND AVENUE SOUTHWEST • WASECA, MINNESOTA

**WANTED!** Amateur or govt. surplus receivers, transmitters, test equipment, teletype, Boehme, manuals; such as ART-13, ARN-7, ARC-1, APR-4, 75A, 32V, BC-610, BC-614, BC-342, BC-348, BC-221, TDQ. Cash or trade for NEW Johnson Viking Ranger, B&W, Hallicrafters, Hammarlund, Harvey-Wells, National, Central El, Gonset, Elmac, Morrow, RME, Telrex, Fisher Hi Fi, Pentron, Bell, Master Mobile, Sonar, etc.

Stores: 44 Canal St., Boston, Mass. 60 Spring St., Newport, R. I.

# ULTRA MODULATION NEW NEW

## A REVOLUTIONARY SYSTEM!

... Of Audio Control that permits the use of more Audio power than normal Carrier Power without causing splatter or increased bandwidth!

Modulate your carrier with all the Audio Power your rig is capable of delivering, by using:—

## THE ULTRA MODULATION UNIT!

*This Unit:—*

**PREVENTS**— Splatter or increased bandwidth normally caused by high Audio power on any rig from the Johnson Viking Class to the Collins KW-1 Class.

**INCREASES**— The efficiency of Class B linear rigs and the effectiveness of low powered rigs!

**OPERATES**— Through heavy QRM and high noise levels with the overriding effect of strong Audio!

**SIMPLE** to install on any rig:— **LOW** in price!

**GET THE FACTS TODAY!**

For Information Folder, write to:—

**Ultra Modulation Company**

P.O. Box 485

Red Bank, N. J.

## Hints & Kinks

(Continued from page 46)

been replaced with a VR-150. This substitution increases the voltage for the oscillator tube and raises the screen potential of the 6L6. Recalibration of the VFO after the modification was not necessary.

—H. Van Hooser, W4DIJ

## CRYSTAL STORAGE RACK

**W**e find it necessary to have quite a number of crystals on hand to cover the whole of any amateur band. When changing frequency, it has been necessary in the past to dig and sort through a box or jar until the appropriate crystal was located.

The confusion associated previously with the selection of a crystal has been eliminated by the rack shown in Fig. 7. The holder was made from a piece of oak board measuring  $\frac{3}{4}$  by  $2\frac{1}{2}$  by 6 inches. The four rows of holes shown in the drawing are made with a No. 39 drill and accommodate a total of 20 Type FT-243 crystals.

Fig. 7—This crystal storage rack can be an attractive and useful addition to the shack.

The size of the rack was determined by the number of crystals on hand and may be altered to suit the individual requirements. Oak board was selected because of its hardness, thereby preventing the enlargement of the holes through prolonged usage. The whole unit was finished in light oak stain and coated with good varnish. A backing of pool cloth is an extra refinement and a pair of screw eyes permit hanging on a wall.

# HAM-ADS

(1) Advertising shall pertain to radio and shall be of nature of interest to radio amateurs or experimenters in their pursuit of the art.

(2) No display of any character will be accepted, nor can any special typographical arrangement, such as all or part capital letters be used which would tend to make one advertisement stand out from the others. No Box Reply Service can be maintained in these columns nor may commercial type copy be signed solely with amateur call letters.

(3) The Ham-Ad rate is 30¢ per word, except as noted in paragraph (6) below.

(4) Remittance in full must accompany copy. No cash or contract discount or agency commission will be allowed.

(5) Closing date for Ham-Ads is the 20th of the second month preceding publication date.

(6) A special rate of 7¢ per word will apply to advertising which, in our judgment, is obviously non-commercial in nature, and is placed and signed by a member of the American Radio Relay League. Thus, advertising of bona fide surplus equipment offered for exchange or for sale by an individual or apparatus offered for exchange or for advertising inquiring for special equipment, if by a member of the American Radio Relay League take the 7¢ rate. An attempt to deal in apparatus in quantity for profit, even if by an individual, is commercial and all advertising by him takes the 30¢ rate. Provisions of paragraphs (1), (2) and (5), apply to all advertising in this column regardless of which rate may apply. To expedite handling of your copy please state whether you are a member of ARRL.

(7) Because error is more easily avoided, it is requested signature and address be printed plainly. Typewritten copy preferred, but handwritten signature must accompany all authorized insertions.

(8) No advertiser may use more than 100 words in any one issue nor more than one ad in one issue.

*Having made no investigation of the advertisers in the classified columns, the publishers of QST are unable to vouch for their integrity or for the grade or character of the products or services advertised.*

Application

90672

### The No. 90672 ANTENNA BRIDGE

The Millen 90672 Antenna Bridge is an accurate and sensitive bridge for measuring impedances in the range of 5 to 500 ohms at radio frequencies up to 200 mc. It is entirely different in basic design from previous devices offered for this type service inasmuch as it employs no variable resistors of any sort. The variable element is an especially designed differential variable capacitor capable of high accuracy and permanency of calibration over a wide range of frequencies. A grid dip meter such as the Millen 90651 may be used as the source of RF signal. The bridge may be used to measure antenna radiation resistance, antenna resonance, transmission line impedance, standing wave ratio, receiver input impedance and many other radio frequency impedances. By means of the antenna bridge, an antenna matching unit may be adjusted so as to provide the minimum standing wave ratio on the radiation system at all frequencies.

## Complete Specifications and Features NC-300

No greater sensitivity in any ham receiver at any price (3-6 db noise figure on all amateur bands) plus...greater stability than most receivers costing \$695...plus all these sensational new features and priced at only \$349.95!

**NEW!** Features a total of 10 dial scales for coverage of 160 to 1 1/2 meters with National's exclusive new converter provision with the receiver scales calibrated for 6, 2, 1 1/2 meters using a special 30-35 mc tunable IF band.

**NEW!** Longest slide rule dial ever! More than a foot long! Easily readable to 2 kc without interpolation up to 21.5 mc.

**NEW!** 3 position IF selector—.5 kc, 3.5 kc, 8 kc—provides super selectivity, gives optimum band width for CW, phone, phone net or VHF operation.

**NEW!** Separate linear detector for single sideband...decreases distortion by allowing AVC "on" with single sideband...will not block with RF gain full open.

**NEW!** Hi-speed, smooth inertia tuning dial with 40 to 1 ratio! Provides easier, more accurate tuning. Smoothest dial you've ever used.

**NEW!** Exclusive optional RF gain provision for best CW results allows independent control of IF gain!

**NEW!** Giant, easy to read, "S" meter!

**NEW!** Provision for external control of RF gain automatically during transmitting periods.

**NEW!** Muting provision for CW break-in operation.

**PLUS!**—the newest look in ham receivers... "Massive in the modern manner"... truly a "dream receiver" that can be used either as a table or rack model!

**PLUS!**—all these other sensational National features:

★—Calibration reset adjustable from front panel to provide exact frequency setting!

★—Dual conversion with better than 50 db primary image rejection on all amateur bands, plus better than 60 db secondary image rejection!

★—Xtal filter with phasing control and 3 position band width control!

★—Wide range tone control—for control of both low frequency and high frequency end of response curve!

★—Socket for Xtal calibrator plus accessory socket for powering converters and future accessories!

★—1st IF frequency—2215 kc

★—2nd IF frequency—80 kc

amateur net †

From thousands of different suggestions—submitted by amateurs themselves in a world-wide contest—a distinguished panel of experts picked the best. Now, in **THIS RECEIVER**—the NC-300—National presents the most de-

sirable features from the thousands of ideas received.

● Check these features. Aren't they what *you* want most in a receiver? Check the price. Never before so much of what's "most wanted" for so little.

† Prices slightly higher west of the Rockies and outside Continental U.S.A.

New Hallicrafters SX-100  
Communications Receiver

## LEADING AMATEUR DESIGNS ...Use RCA Tubes

*And the new Hallicrafters SX-100 is another example.*

Featuring such modern circuitry as double I-F conversion and single-sideband reception, the SX-100 is the newest addition to the Hallicrafters line that has been making communications history on the amateur bands for many years.

In this fine receiver, as in many other leading amateur and commercial designs, *RCA Receiving Tubes* are specified—because the tests of time have proved that RCA Receiving Tubes can really *take it* in day-in and day-out operation. High uniformity of characteristics makes it possible to interchange them—no matter where or when you buy them—without a lot of circuit readjustment. RCA Receiving Tubes help with greater background *quietness* enabling you effectively to boost receiver sensitivity without “knocking out” the signal.

There is an RCA Tube for practically every receiver and transmitter application in amateur radio. See your RCA Tube Distributor for the types you need.

### NEW RC-17 RCA RECEIVING TUBE MANUAL

Includes basic tube theory, installation and operation data, application help, charts, circuits. Revised and up-to-date. Only 60 cents, from your RCA Tube Distributor.
